Euclid and Ptolemy both assumed that vision occurred by the emission of rays of sight from the eyes ("extramission"). Arabic philosophers and mathematicians sought to reconcile this mathematical theory of vision with Aristotle's account of sight, in which the eye played a more passive role. The culmination of this effort was in the *Optics* of ibn al-Haytham (Alhacen or Alhazen), which greatly extended the mathematical analysis of direct, reflected, and refracted vision of Ptolemy's *Optics*, on the basis of an eye that

received light from objects (“intromission”), which it filtered and ordered by refraction.

The Latin “Perspectivist” writers of the thirteenth century elaborated an optical theory that drew heavily on Arabic mathematicians, while bringing in other ancient and contemporary sources. The work of the Polish mathematician Witelo was particularly important for the Renaissance. His *Optics* encompassed the whole of Alhazen’s *Optics*, which he augmented by mixing into it theorems from Euclid, Ptolemy, Hero of Alexandria (from a work of optical marvels often falsely attributed to Ptolemy), as well as theorems from the medieval optical tradition. He also drew on the mathematics of Archimedes and Apollonius, whose works, like many of the ancient optical writings as well, he knew through his collaboration with the translator William of Moerbeke. In setting out his *Optics*, Witelo was concerned to enforce a distinction between the mathematical and the natural philosophical, often demonstrating a theorem first purely geometrically, and only later applying it to light and vision. As a result, his work could be prolix and repetitive; it is nearly twice as long as Alhazen’s work on which it was based. Nevertheless, Witelo’s attention to this distinction, and the self-contained nature of his geometrical teaching, as well as the encyclopedic reach of the whole work, helped to make Witelo’s work popular at the medieval universities, where it was often assigned as a geometrical text in place of Euclid’s *Elements*.

Witelo’s centrality in the Renaissance was cemented by the publication of his work in 1572 in a compendium with Alhazen’s *Optics*, edited by Friedrich Risner, a protégé of Petrus Ramus. It was this volume (Alhazen and Witelo 1572) that served as the fundamental textbook for innovators in optics around the turn of the seventeenth century: Giambattista della Porta, Johannes Kepler, Thomas Harriot, and Willebrord Snell, for example. Kepler’s first great work on optics, published in 1604, arguably formed the foundation of an entirely new kind of optics; yet it took Witelo’s work as a critical starting point and bore the deceptively anodyne title *Supplements to Witelo (Ad Vitellionem Paralipomena)*.

Despite the dominance of Witelo, there was also a revival of interest in ancient optics, particularly in the works of Euclid, in the later sixteenth century. Jean Pena (another protégé of Ramus) published an edition and Latin translation of Euclid’s *Optics* and *Catoptrics*. Pena’s preface to this work, which was widely read and even published separately, defended a Stoic physics in which he rejected, on optical grounds, the Aristotelian separation between the sublunar and celestial realms and the reality of the planetary spheres. This work influenced the astronomers Christoph Rothmann and Tycho Brahe, thereby playing an important role in the development of the new astronomy (Barker 1985). In 1573, Egnazio Danti published an Italian version of Pena’s Latin translation, also summarizing without acknowledgement Pena’s preface in his own introduction (Frangenberg 1988).

Innovative and Original Aspects

Eyeglasses with convex lenses had been manufactured in Europe since the thirteenth century (Rosen 1956). Such spectacles corrected farsightedness and presbyopia. Concave lenses in eyeglasses, to correct myopia, began to be widely used only in the sixteenth century (Ilardi 2007). Lenses thus started to become common objects in Europe at roughly the same time that Perspectivist writers, such as Witelo, were writing their treatises. Yet the two developments seem to have been entirely independent, and Perspectivist authors (like their ancient and Arabic predecessors) paid no attention to the properties of lenses. But the appearance of convex eyeglasses seems to have stimulated an interest in the properties of lenses, which in turn contributed to a new concern with refraction itself. Francesco Maurolico (d. 1575) wrote a treatise on optics, *Photismi de lumine*, which was very likely the first to attempt to explain the action of lenses (though it was published only much later, in 1611). In the second edition of his *Magia naturalis* (1589), Giambattista della Porta coined the term “lens” and described some of the marvels that could be performed with eyeglasses. He did not explain

there how lenses worked, though attempted to do so in his very odd work *De refractione* published 4 years later. The first successful analysis of lenses was provided by Kepler, in his *Dioptrice* of 1611. Another stimulus to the study of refraction was an interest in atmospheric refraction and how it affected the observations that underlay the revival of astronomy.

In his 1604 work on optics, Kepler unsuccessfully sought a general rule to relate the angle of incidence of light to its angle after refraction through glass or water, a law of refraction (*lex refractionis*) which had been postulated to exist (even if unknown) since at least the thirteenth century in the work of Roger Bacon (Ruby 1986). The problem of refraction had arisen in antiquity. The relation between the angle of incidence of light (or sight) and its angle of reflection from a mirror was well known – they were equal. Was there a similar relationship between the angles of incidence and refraction at an interface between two different transparent media? In his *Optics*, Ptolemy had set out a table of refractions at 10° intervals, between air and water, air and glass, and glass and water but was unable to state any general rule for the relationship (Smith 1982). Witelo included Ptolemy's table, with modifications, in his *Optics*; from its publication in 1572, these figures provided the primary experimental data for optical theorists and a standard against which experimenters measured their results – sometimes with unhappy consequences (Lohne 1968). The sine law of refraction (whereby the sines of the angles of incidence and refraction are in a constant proportion, for a given pair of media) was discovered independently at least three times in the first decades of the seventeenth century. Thomas Harriot discovered the law in 1601; Willebrord Snell discovered it in the early 1620s; and René Descartes and Claude Mydorge found it a few years later, in 1626 according to Descartes' later recollection (Sabra 1981). All four men had studied the accounts of refraction in Alhazen and Witelo; they were inspired by the kinematic models of light and the theories of image location found in those texts to formulate a general mathematical account of refraction.

The optical tradition from Alhazen and the Latin Perspectivists had employed a rhetoric of experimentation. That is, they supported their statements about direct, reflected, and refracted light with descriptions of elaborate experiments, which they very likely did not actually perform. Witelo, for instance, described in detail the method by which he measured refraction angles. But he made no improvement on Ptolemy's experimental values and also constructed a priori tables in the opposite direction to Ptolemy's (from water to air, for example, to complement Ptolemy's table from air to water) which were in fact nonsensical, as any actual experimentation would have revealed. In clear distinction, optical theorists in the Renaissance performed the experiments that their predecessors had for the most part only described and then went beyond them. This experimental turn must be connected with the larger role that experiment began to play in general during this period. But it also was conditioned by the ready availability of optical objects for experimentation: lenses, as already noted, but also crystal spheres and prisms of great clarity, sold as toys and curiosities, and highly reflective plane and curved mirrors, found either in household use or (in the case of large concave mirrors) as luxury objects in cabinets of curiosity (Dupré 2008). The telescope, invented in 1608 using practical craft knowledge rather than mathematical optics, both stimulated research in optics and challenged the Perspectivist tradition, whose methods were wholly inadequate to explain the instrument's magnification (van Helden 1977).

Another optical object was invented in this period which was less heralded than the telescope but had consequences for optics that were hardly less momentous. Witelo and other medieval optical writers had experimented with refraction and the production of colors from white light using the naturally occurring hexagonal quartz crystal. The multiple internal reflections in the crystal made a systematic investigation of color very difficult; Witelo had only partially simplified the phenomenon by obscuring some facets with opaque wax. In the 1530s and 1540s, jewelers in Italy and France began making the now familiar *triangular* prism, by cutting quartz crystals longitudinally

into six parts. They were originally sold as toys to look through, in order to view the world inverted and fringed with colors, or as lusters to hang from lamps and in windows (Gage 2000, Chap. 8). Optical experimenters eventually discovered their utility for investigating color, beginning with della Porta in his 1593 *De refractione*. Thomas Harriot and Willebrord Snell both used triangular prisms in their experiments, as most famously did Newton – though even then prisms (which he may have purchased at a fair) were still amusements or novelties rather than common scientific instruments (Schaffer 1989).

Ancient optics had treated the eye as an active source of radiation, producing visual rays that were entirely responsible for sight. The eye itself was not treated at all as an optical object, in the sense that it might affect the passage of light. Alhazen and the Perspectivist writers, in contrast, were committed to an intromissive theory of vision, in which light carried the appearances of objects into the eye. The refractive properties of the eye itself were crucial to their theory. Only light that was perpendicular to the cornea could pass through unrefracted and thus (they argued) be strong enough to register in vision; thus the chaos of incoherent, multidirectional light reflected from objects in the outside world was filtered into a coherent visual cone, where precisely one ray from each point in the visual field would be admitted perpendicularly into the eye. Alhazen and his successors imagined that this coherent picture of the world was assembled onto the anterior surface of the crystalline humor (what we call the “lens”), which was the sensitive part of the eye. But this humor was also itself a refractive object, which concentrated the picture into a narrow beam, focused directly into the hollow optic nerve at the back of the eye. The retina played no role in vision but was thought to nourish the vitreous and crystalline humors (Lindberg 1976, 35, 71–85).

A combination of factors in the sixteenth and early seventeenth centuries led to a complete reassessment of the role of the eye in vision. In general, anatomy was in a process of transformation, through a new emphasis on dissection and

autopsy. The structure of the eye was much more precisely described; in particular, the crystalline humor was found to be not in the center of the eye and of perfectly spherical shape (as Perspectivist optics had claimed) but towards the front of the eye and flattened on its anterior surface. The anatomical study of the eye, and the recognition of the refractive role of the lens, culminated in 1583 with the brilliant work of Felix Platter (Lindberg 1976, 168–177). In addition, several authors in this period began to compare the eye to the newly popular *camera obscura*. Most famously, della Porta in 1589 described an improved design of the *camera obscura*, in which the aperture contained a convex lens, with a concave mirror at the very center to project the vivid, enlarged, and upright image onto the screen. He compared this marvel with the eye, likening the lens in the aperture to the refractive surface of the cornea, and the concave mirror at the center to the crystalline humor. A few years earlier, the engineer Giovanni Battista Benedetti had suggested that the eye was like a *camera obscura*, in which the image was projected onto the retina. He noted that the image would be inverted in the *camera obscura*; however, some intervening refractive humors in the eye worked to turn the image back up the right way (Frangenberg 1988). Benedetti’s work was far less well-known than della Porta’s best-selling *Magia naturalis*, but it did find one receptive reader in Kepler. In his 1604 optical work, Kepler correctly described the optics of the eye, this time reconciling himself to the inverted image on the retina. His work prepared the way for Descartes’ *Dioptrique* of 1637, in which the eye is an entirely passive optical object. If Aristotle had insisted that a dead eye, unable to perform its active function, was not really an eye at all (*Parts of Animals* 641a5), Descartes showed that an eye plucked from a body was in all respects still an eye, insofar as it was still a refractive instrument that could form optical images.

At the same time, the mathematical rules for image-location, unquestioned since Euclid, came under scrutiny. Ancient optics located the image

of an object, after reflection or refraction, by a simple geometrical rule. Improvements in optical objects, and the study of lenses, showed that this rule was sometimes false; moreover, it had no physical reason to be true. From the 1580s, mathematicians and optical theorists began to consider the role of binocular vision in the location of images, whether direct, reflected, or refracted. For ancient and medieval optics, the presence of two eyes merely extended the visual field, while also showing nature's sagacity in providing a second eye, should one be damaged. The connection between binocularism and depth-perception seems to have been made first by Benedetti, and then more famously by Kepler (Goulding 2018).

Advances in mathematics also affected the science of optics. Mathematicians in the sixteenth century had recovered and then surpassed the Greek mathematical legacy from antiquity. The theory of conics and other curves reached its highest point since antiquity, and was used to investigate burning mirrors and lenses, and the nature of refraction itself. The calculational shortcuts of prostaphaeresis and logarithms, developed between 1580 and 1620, greatly reduced the tedium of multiplying and dividing long numbers (such as the sines of angles), and made it possible for optical theorists to investigate optical objects mathematically and to construct tables.

Beginning with Euclid, traditional optics had preserved a small space for the theory of burning mirrors. Euclid and some of his successors had attempted, unsuccessfully, to describe the action of the concave spherical mirror. Diocles wrote a short treatise that accurately described the optics of both the spherical and the parabolic burning mirror (Rashed 2002). This treatise, lost in the original Greek, circulated in Arabic translation and was incorporated into works by Alhazen and others, which influenced the medieval Latin understanding of conic sections (Clagett 1964–1984). Drawing on this older tradition, as well as recently rediscovered Greek texts, Renaissance optical writers became ever more interested in the possibility of marvelous burning

mirrors. The apocryphal story of Archimedes burning the ships at Syracuse became a commonplace of prefaces to optical works, often explicitly directed at princely patrons who might be attracted to this military technology. At the same time, the crafts of glass and metal working now put these legendary deeds within reach. Experiments with concave mirrors led to two complementary developments. On the one hand, interest in such mirrors as burning instruments, which produced objective effects independent of any observer, helped to shift the center of attention in optics from its traditional concern with sight to light itself. But on the other, the visual space of the concave mirror was explored by makers and users of finely constructed mirrors, and was carefully mapped by the Venetian Ettore Ausonio, who graphically catalogued the visual phenomena of the mirror. His discovery of the “point of inversion” of the concave mirror and his careful description from direct experience of magnification and distortion at varying distances, both quite unpredicted by medieval Perspectivist optics, greatly influenced the thought of della Porta, Galileo, and other practically minded opticians (Dupré 2005).

Finally, mention must be made of the perfecting of perspectival representation in Renaissance art. There is some controversy about the degree to which ancient and medieval optics affected, or *could* affect the discovery of linear perspective, even if fundamental perspectival constructions were justified by optical reasoning (Brownson 1981; Frangenberg 1986; Knorr 1991). But however it was discovered perspectival representation affected the study of optics itself. The fact that a painting could perfectly mimic the visual field, so that one could not distinguish between looking at a work of art or through a window, aided the development of the notion of the real optical image (or *pictura*), in contrast to the older idea of a *species*. Moreover, familiarity with perspectival images may have assisted Galileo in interpreting the images of the moon he saw through his telescope as representing heights and depressions (Edgerton 2009).

Impact and Legacy

The changes in optics in the sixteenth and early seventeenth centuries were arguably as revolutionary as those that took place in astronomy in the same period, and had a similarly broad effect. The subject of the mathematical science of optics was finally transformed from sight to light itself (Smith 2014). The eye, which had retained an active role throughout medieval optics (even if diminished from antiquity) finally became an entirely passive machine in the philosophy of Descartes. This was appropriate for a philosophy that drew a clear distinction between the mechanical and deterministic physical world and the activity of the mind; moreover, Descartes' optical experimentation and theorizing may have been a significant impetus in the formation of his philosophy (Schuster 2013).

As light, rather than the eye, became the active principle in Renaissance optics, practitioners focused their attention on the nature of light itself. A crucial part of the legacy of Renaissance optics is a new concern with causation, by which optics was both assimilated into and shaped the new study of physics. For medieval optics, it did not matter what light actually was. It was a mathematical science, concerned with rays of light as lines *qua* physical, to use Aristotle's formulation (*Physics* II.219a10). Alhazen avoided discussing the actual substance of light; his medieval successors postulated *species* carried by light but were vague about the constitution of the either the *species* or their vehicle. In contrast, Kepler began his *Optics* with an attempt to describe the nature of light, from which its properties would be derived. So too (though very differently) did Descartes. Newton and Huygens established the two models of light that would be in tension with each other until the twentieth century, particles and wave, from which each managed to build a causal account of optics. The mathematician Fermat began from the nature of light – that it was something that travelled through space, and the more slowly through a denser medium – and thence derived a *reason* for the sine law of refraction.

Universität Innsbruck, Innsbruck, Austria

Abstract

The idea that prophetic predictions provided by oracles and inspired by the gods could be adopted in proving Christian dogmas dates back to Late Antiquity and the Middle Ages. In the Renaissance, the discourse significantly enlarged because of previously unknown sources and new interpretations.

Heritage and Rupture with the Tradition

In Antiquity, an oracle was considered to be a person able to predict the future through divine inspiration. As oracles were thought to acquire the divine words and transmit them to people, in ancient sources they were often pictured in a frenzied state. The two most famous oracles of Greek Antiquity were Pythia, the oracle of Apollo at Delphi, and the oracle at Dodona in Epirus. According to the ancients, other mythical figures, such as sibyls, provided similar forms of divination. These women, through whose lips, as was believed, the gods spoke to the audience, were described in a number of influential ancient sources. The most significant one was Virgil's *Eclogue IV* (Virgil 1999). Part of his *Eclogues*, also known as the *Bucolics*, written around 40 BC, during a time of temporary political stability after the second triumvirate deal, this fragment describes the birth of a boy who is expected to become divine and will eventually rule over the world. In the *Eclogue*, this prediction is associated with the Cumaean sibyl. Although the fragment in question seems to have had a political dimension, early Christian writers reinterpreted the whole *Eclogue IV* to be about the birth of Jesus Christ.

This Christianized vision of Virgil's *Eclogue* formed an important trend in interpreting the place of ancient oracles and sibyls within Christian theological tradition. Totally denying any kind of pagan or magical elements, Christian thinkers, however, accepted the idea of *philosophia perennis* ("perennial philosophy") – a doctrine claiming that a single true theology exists, which manifests itself within different societies. Besides, for many medieval scholars, Virgil did not only predict the birth of Christ, he obtained the fame of a pre-Christian prophet. Such a Christian interpretation of *Eclogue IV* explains the fact that Virgil accompanied Dante in the two first parts of the *Divine Comedy* (*Hell* and *Purgatory*) (Alighieri 2008), while Michelangelo pictured the Cumaean sibyl on the ceiling painting of the Sistine Chapel.

The myth of oracles or sibyls who had predicted the birth of Christ before Christ received one more justification in the fifteenth century with the transmission of the so-called pseudo-Zoroastrian oracles into the West (Majercik 1989). In the classical period, Zoroaster was considered to be the creator of magic, the founder of astrology, and the author of numerous works on philosophy, magic, alchemy, and astrology. His biography, though short and often confusing and erroneous, was object of interest for some influential ancient authors such as Pliny, Porphyry, Origen, Arnobius, and others. Plato's interest in Zoroaster and Persia is evident from several dialogues. In the *First Alcibiades*, the magic of Zoroaster is seen as being nothing but the service of the gods in which the Persian kings instructed their sons. Plato's disciples including Hermodorus, Eudoxus, and Heraclides Ponticus followed their teacher in exploring Zoroastrianism. In the *Metaphysics*, Aristotle called the Persian magi, the followers of Zoroaster, the earliest forerunners of Plato. The *Oracula Chaldaica* made up of Neoplatonic, Pythagorean, Stoic, Gnostic, and Persian sources were compiled in the second century AD by a certain Julian. Proclus is supposed to have been working on a commentary, now lost, on the *Oracula*. The Byzantine scholar Michael Psellus gathered the

fragments of the *Oracula* and wrote commentaries and expositions on the Chaldean theurgy. In the West, Petrarch described Zoroaster as the founder of magical arts in the *Trionfo della fama*, which marked the trend to definitely associate the name of Zoroaster with the *Oracula Chaldaica*. The Renaissance interest in the pseudo-Zoroastrian oracles was primarily due to Georgius Gemistus, also known as Plethon, one of the most influential Byzantine *émigrés*. Plethon was the first to infer that Zoroaster was the source for the *Oracula Chaldaica*. Along with bringing its manuscript to the West, Plethon introduced Zoroaster as the first (and the most important) among *prisci theologi*. The *prisca theologia* ("ancient theology") concept, another form of the *philosophia perennis* doctrine, became popular among Renaissance thinkers of the late fifteenth and early sixteenth centuries. Although Marsilio Ficino did not meet Plethon in person, he was definitely under his influence. He read a manuscript with Plethon's writings, now kept in the Biblioteca Riccardiana in Florence, and even added his own translation of the Zoroastrian oracles to the body of his fundamental *Theologia platonica de immortalitate animorum* (Ficino 2001–2006). In the chronology of *prisca theologia* described in the *De religione christiana*, Ficino named Zoroaster the first *priscus theologus* who influenced Hermes, Orpheus, Plato, and other pre-Christian theologians. Due to this, Zoroaster and the *Oracula* took an honorable and unique place within Renaissance philosophical agenda. Zoroaster also contributed to the legend of pre-Christian oracles.

Impact and Legacy

Along with another source, the *Sibylline Oracles*, a collection of oracular utterances written in Greek hexameters and ascribed to the sibyls, the *Oracula Chaldaica* played an important role in the diffusion of the *prisca theologia* doctrine and pseudo-ancient theurgical practices. Pico della Mirandola, Ficino's younger contemporary,

accepted the Zoroastrian oracles as an authentic Oriental doctrine. In a letter to Ficino, he claimed:

I was forcibly taken off from other things and instigated to the Arabic and Chaldaic learning by certain books in both those languages, which came to my hands, not accidentally, but doubtless by the disposal of God, in favour of my studies. Hear the inscriptions, and you will believe it. The Chaldaic books (if they are books and not rather treasures) are the oracles of Esra, Zoroaster, and Melchior, Magi; in which those things which are faulty and defective in the Greek, are perfect and entire. There is also an exposition of the Chaldean wise men upon these oracles, short and knotty, but full of mysteries. There is also a book of the doctrines of the Chaldean theology, and upon it a divine and copious discourse of the Persians, Greeks, and Chaldeans.

The Zoroastrian oracles appeared in a number of Pico's early writings including the famous *Oratio de hominis dignitate* and the *900 Conclusiones*, as a crucial source for reconstructing ancient wisdom. However, in his later treatises, particularly in the *Disputationes adversus astrologiam divinatricem*, Pico rejected Zoroaster and the whole *prisca theologia* accusing them of legitimating astrology and other magical arts.

Starting with Ficino and Pico, two approaches to the oracles were dominant. The first group of scholars accepted Ficino's and early Pico's association of Zoroaster with the Christian tradition. Their opponents condemned the *Oracula* as spurious and not "ancient," since written already after Christ. Many learned scholars in Italy and Europe followed Ficino and Pico in their attempts of reconstructing the *prisca theologia* doctrine with the use of Zoroaster. The Aristotelian philosopher Pietro Pomponazzi, who usually opposed the Florentine philosophers, cited Zoroaster in support of the resurrection in his *De naturalium effectuum causis sive de incantationibus*. In attempting to deduce all philosophical and religious doctrines from Zoroaster and to achieve a concordance between them and expressions in the Gospels, Agostino Steuco drew on the *Oracula*. In his *De perenni philosophia*, he remained loyal to Ficino and named Zoroaster the most ancient theologian whose views were followed by the Greeks. Zoroaster was also cited in Francesco Patrizi's and Giordano Bruno's works. Patrizi

went on to publish a Latin translation of the text in the appendix to his *Nova de universis philosophia* (1591).

The views of Ficino and Pico on the *prisca theologia* doctrine and the Zoroastrian oracles spread across Europe. They received support in France, for instance, in the writings of Symphorien Champier whose use of Zoroaster and the *Oracula* could be seen in the *De quadruplici vita* published in 1507. The French Protestant writer Philippe de Mornay finds much in Zoroaster to substantiate with the Christian religion. In his *De la vérité de la religion chrétienne contre les athées, épicuriens, payens, juifs, mahométans et autres infidèles*, published in 1581 in Antwerp, he even used Zoroastrian teaching to prove the essential Christian dogmas such as the Trinity.

The first printed editions of the *Oracula* appeared in France. In 1538, Jean Loys (Johannes Lodovicus Tiletanus) published in Paris the *editio princeps* of the Greek oracles. In the following year, Jacques de Sainte Marthe (Jacobus Marthanus Pictaviensis) prepared and published a Latin translation, without the Greek version, under the title *Magica Zoroastri oracula*; he supplemented this text with his Latin translation of Plethon's Greek commentary on the *Oracula*. The Latin and Greek versions of the *Oracula*, along with Plethon's commentary, were republished more than once throughout the whole sixteenth century. The first vernacular (French) translation was published in Paris in 1556 by François Habert.

In other European countries, the *Oracula* were also widespread. Johann Reuchlin, Michael Servetus, Cornelius Agrippa, and Cornelius Gemma acknowledged the importance of the Zoroastrian oracles in the formation of ancient philosophy and Christian religion. In 1593, the physician Johann Jessenius even published in Wittenberg a book specifically devoted to Zoroaster entitled *Zoroaster. Nova brevis veraque de universo philosophia*. The Cambridge Platonists, namely, Ralph Cudworth and Henry More, accepted the oracles as valid and authentic.

On the other hand, in the late sixteenth and seventeenth centuries, opposition to Zoroaster's

authority significantly raised. The Calvinist theologian Theodore Beza was one of the first who condemned the oracles as erroneous. While a few scholars insisted on the authenticity of the oracles, others like Petrus Lambecius, Theophilus Spizelius, Johann Heinrich Ursinus, and Thomas Burnet ascribed the *Oracula* to Greek Platonists in the period after Christ. This supposition became dominant in the second half of the seventeenth century. Eighteenth-century scholars, including Johannes Franciscus Buddeus, Isaac de Beausobre, and Johann Lorenz von Mosheim, unconditionally condemned the oracles as being counterfeit. Thus, in the early modern period, the *Oracula*, not unlike the *Corpus Hermeticum* and other treatises of the same genre, eventually lost their influence, and the concept of pre-Christian oracles was radically reconsidered and then rejected.

Organism in Renaissance Sciences

Georg Toepfer

Center for Literary and Cultural Research Berlin, Berlin, Germany

Abstract

Since antiquity, living beings have been defined as organic bodies able to perform certain complex activities, including nourishment, growth, and reproduction. These activities, or basic organic functions, were attributed to the soul and its parts. According to ancient physiological theory, the soul is linked to the organization of the body, but is not a direct cause or result of it. Renaissance authors adopted this view of the soul as the principle of life. In various instances they emphasized the interaction and interdependence of the organic parts as the precondition for the performance of typical activities. Such an explanation was often achieved by comparing the body of a living being with the cosmic order, complex artifacts, man-made constructions, or the interaction between individuals in social groups. By stressing the interdependence of parts as well as the resulting functional closure as the scientific foundation of understanding and explaining organic systems, Renaissance conceptual models have paved the way for a materialistic and at the same time holistic understanding of living beings as organisms, which was then consolidated during the eighteenth and nineteenth centuries.

Heritage and Rupture with the Tradition

In ancient philosophy, a clear-cut model of the organism as a system of interdependent parts did not exist. There was, however, a concept of the *living being* in Aristotle's writings. It was established as a particular ontological category defined by the possession of a soul and by the capacity for particular activities such as

nourishment, growth, reproduction, and, to a certain extent, locomotion and perception (following Aristotle, *De anima* 412a). But these faculties were not analyzed or explained in terms of an “organism,” i.e., as the organization of the body as a decentralized structure whose unity relies on the interdependence of its parts.

This nonorganismic view of living beings is especially true for Aristotle. The term “organic body,” as introduced by Aristotle, should not be translated (as is often the case) as a “body endowed with organs,” but should be understood in the sense of an “instrumental body” (Bos 2003), for in all other contexts where the expression “organic” appears in Aristotle’s writings, it is used in lieu of “instrumental.” The living body, according to Aristotle, is essentially characterized as an instrument for the soul; in his thinking the soul alone is the life-bearing principle. The modern understanding of “organic body,” meaning a body consisting of diverse functional parts, appeared in late Antiquity (e.g., with John Philoponus in the sixth century). But it was not until scholastic times that it acquired the status of a technical term. In the writings of Thomas Aquinas, the term holds a special place and is defined with the aid of an incorrect interpretation of Aristotle’s writings as “a body having a diversity of organs” (*Commentarius in libros de anima II et III* 2, 1, 20; No. 230).

There were, however, some ideas in ancient thought that were conceptually related to the modern view of living beings as systems of interdependent parts. This applies especially to the analogy of organisms and societies. Organisms and human societies consist of a multitude of diverse components, but their interactions result in homogeneous outcomes, such as the preservation and propagation of the whole system (in the case of the organism). Following the principle of the division of labor, the stomach and hands, for example, bear a relationship of interdependence in an analogous way as the classes of a society depend on each other – this being the message of the famous fable of Menenius Agrippa (Livius, *Ab urbe condita* II, 32). This comparison laid the foundation for viewing living beings as complex and organized systems; but the basic principle of these systems – the

interdependence of parts – never acquired a key position in the definition of living beings. It was the possession of a soul that made living beings what they were, not their internal composition.

The conception of living beings as organisms only emerged later through the rise of physiological knowledge and the use of metaphors from the human sphere. Thus, the Roman physician Galen, who probably possessed the best knowledge of human physiology in the ancient world, described the relationship between the parts of the human body as *sympathy* (Galen, *De usu partium corporis humani* I, 8) and compared the body to a *symphony* (Galen, *De methodo medendi*, ed. Kühn X, p. 643). Thinking about physiological processes also provided a functional understanding of the soul as being diffuse and possessing diverse interacting parts. By connecting it to physiological knowledge, the concept of the soul gradually transformed in such a way that it could be identified with the functional organization of the body – its parts depending on the influence of other parts (Siegel 1973, p. 129).

Since late medieval times, the organic body has increasingly been understood as a system of organs whose complex functions resulted from the interaction of their parts. In his discussion of Aristotle, Marsilius of Padua describes living bodies as composed of distinct parts that stand in a definite relation to each other and whose functions result from their communication with one another as well as with the whole system (1324, I, 1, §3). Marsilius applied this model to both living bodies and societies.

Innovative and Original Aspects

The most innovative development by Renaissance scientists was their systematic practice of empirical investigation combined with systematic description. A prime example of this dual movement is typified in the work of the scientist-artist Leonardo da Vinci. After dissecting many human corpses, he provided detailed drawings of the inner organs and their anatomical connectivity. In these visual representations, every organ was

shown as an integral part of the body, suggesting that the body is a functionally closed system or a whole comprised of interacting parts. Leonardo explained the functioning of the organs through reference to mechanical models such as pillars, levers, and pulleys. The aim was to integrate the anatomical observations into a physiological model of the body's system. A similar approach, systematically extended to all parts of the human body, is evident in Andreas Vesalius's monumental *De humani corporis fabrica* (1543).

From a theoretical perspective, one of the challenges faced by Renaissance philosophy was how to adapt traditional metaphysics to the mechanistic thinking of the emerging experimental sciences. On the one hand, there was the Aristotelian conception of living beings as substantial forms unified and individuated by the influence of particular souls. On the other hand, there were materialistic approaches for which every composed substance, including living beings, had to be explained beginning from their atomic parts while abiding to the universal laws of motion. The theoretical challenge involved for many authors was how to reconcile these two perspectives with regard to living beings.

One innovative approach put forth in the middle of the sixteenth century by Girolamo Fracastoro (1550) and Julius Caesar Scaliger (1557) sought to combine the medieval theory of *minima naturalia* with a theory of natural mixture. According to this view, complex bodies are composed of a multitude of minute material bodies, but these natural minima retain their form even if they surrender their boundaries within the complex whole. Thus, they combine corpuscularian and non-corpuscularian properties (Blank 2010). Scaliger also stresses the immaterial character of the substantial forms by conceiving them as effective powers that can constitute living bodies. Even the "transmutation" of living organisms from one biological species to another, which Scaliger supposes to be possible, is explained within the framework of his conception of substantial forms. His idea was that transmutation occurs through a shift in the power relation between the various substantial forms within one organism. By allowing for a plural and variable combination of

substantial forms as elementary bodies of an organism, Scaliger combined the Aristotelian metaphysical framework of substantial forms with atomistic elements. Aristotle's substantialism for visible living creatures is thus transformed into a "microsubstantiality" (Smith 2006, p. 9) with a diversity of microsubstances on a level below visible objects.

With regard to these microsubstances, living beings were not necessarily seen to differ from nonliving composite bodies. In the mechanistic framework that was emerging at the time, the specificity of living organisms was increasingly derived from their internal structure, particularly the interaction of their parts. However, until the mid-seventeenth century, the concept of the organism was most often used as a model for human society or the cosmos as a whole without studying its internal structure in its own right. One example is provided by Marsilio Ficino, who in 1469 proposed to interpret the friendly interaction of our body parts as a model for the world because "in us" the inner organs "draw something from each other, and help each other, and sympathize with any one of them when it suffers" (Ficino 1469, VI, 10; pp. 81r–82r) – as do the parts of the world.

This conceptualization of organic bodies as mere models for the cosmos changed with the establishment of mechanistic philosophy and the natural sciences in the seventeenth century. A key element of this approach was to explain the processes and activities in living beings through mechanistic laws and by reducing them to the elementary movements of organic parts. The aim was to replace the soul as an unexplained principle that could not be embedded within the mechanistic program with concepts like "composition," "structure," or "organization."

Replacing the soul with these concepts resulted in a decentralized picture of the causal structure in living systems. In 1628, William Harvey made an important contribution to this picture, when he described the cyclical movement of blood in the body. Although Harvey imagined the heart as the central part of the body and compared it to a sun which governed all vital processes, his model of cyclical movement emphasized the important role of the other body parts as well. It is in line with this

view that Harvey conceived of the movements of animals not as the result of a central governing agent such as the soul or the brain, but as an interaction of diverse components of the body (Harvey 1628).

Mechanical laws were not the only explanatory principles within this program – emphasis was also placed on their interaction and the functional unity of causal systems. Even for mechanistic thinkers like René Descartes, living beings were not just mechanisms. Thus, Descartes stressed the unity and correlation of the parts within them. For him “the body [...] is one and in some manner indivisible”, and he explicitly stated that it is the arrangement or “disposition of the organs” on which the functions of life depend (Descartes 1649, p. 351; 1632, p. 202). Therefore, Descartes also had a kind of holistic conception of living beings as systems of interdependent parts.

In his mechanistic understanding of living beings, Descartes mainly aims at an explanation of organismic movements. In this approach he follows classical authors. But, in contrast to ancient accounts, he does not explain the capacity of living beings to move by themselves with reference to the powers of a soul. Instead, he uses the mechanical and hydraulic devices of his time, such as clocks, mills, and fountains, as models for explaining self-movement. In this view the organism appears as a complex hydromechanical system of springs, tubes, openings, and pulleys. In their interaction, these devices generate the movement of the whole system, and in their interdependence they form one coherent body.

Taking their lead from Descartes, many early natural scientists used the model of the machine to express the interdependence of parts in living beings as organized systems. For example, Kenelm Digby applied this analogy explicitly in 1644 – with the aim of not only reducing vital phenomena to the mechanical level but also emphasizing the interdependence of their parts and the integrity of the whole. Digby simultaneously emphasizes the heterogeneity of the parts in a living being along with their unity and harmony. He explicitly mentions the reciprocity of the parts that establishes this unity. The identity of the whole and of the parts will be destroyed if

one part is removed, he explains. Digby calls this the “correspondence” of the parts and writes “the one [part] not being able to subsist without the other, from whom he deriveth what is needefull for him; and again being so usefull unto that other and having its action and motion so fitting and necessary for it, as without it that other can not be” (Digby 1644, p. 205). The machine model allowed Digby to conceptualize the organism as a harmonious unity of diverse parts contributing – or “conspiring,” as he calls it – toward a common goal. So, instead of one unitary soul as a regulatory center, we have, in this model, dispersed control by heterogeneous parts.

It comes as no surprise that materialist thought played a large role in developing early models of the organism as a concept. Dispensing with the concept of the soul as the central principle for organizing and regulating living beings, they were forced to explain complex life functions through an intricate interaction of body parts. Terminologically, this is demonstrated by an influx of vocabulary from the field of architecture and the realms of industry and craftwork. Talking about the body of a living animal, for example, Giordano Bruno, at the end of the sixteenth century, uses an architectural metaphor (“*composizione d’uno animale*”; “*architettura*”; “*edificio*”; Bruno 1584, p. 23). In the seventeenth century, the watch and clockwork became another leading metaphor to describe life processes (Descartes 1632, p. 202; Locke 1689, p. 331), after having been already used by Thomas Aquinas (1266–1273, II/I, 13, 2).

With the metaphor of the clock and other technical devices, organic processes were not only explained on the basis of mechanistic thinking – for example, self-movement as a result of stored energy – the integration of these systems also provided a model for the functional closure and unity of living beings. During the seventeenth century, “organization” gradually became the central term for specifying the arrangement of matter characteristic of living beings. This was done to the point of identifying “life” with “organization”: In 1662, the botanist Joachim Jungius explicitly replaced “soul” with “organization” as the central principle in explaining life functions. With the

explanatory principle of “organization,” the soul becomes superfluous: “true organization alone suffices,” as he writes (Jungius 1662, part. 2, Sect. 3, Fragm. 5).

Impact and Legacy

During the seventeenth century, the principle of mutual dependence had become central to most definitions of living beings as organisms. One prominent example is Nicolas Malebranche’s definition of an “organic body” as a whole consisting of infinite parts “that mutually depend on each other” (1675, p. 75). In this conception it is the mutual dependence of the parts that is responsible for the system’s unity and closure. The common principle is based upon the *unity of a complex by the interdependence of its parts*. In this way it was possible to reconstruct living beings as intrinsic units of nature on a mechanistic basis. Accordingly, the function of the soul as lending a natural body complex capacities and unity is fulfilled by the principle of interaction and interdependence. By the end of the seventeenth century, Georg Ernst Stahl and Gottfried Wilhelm Leibniz were calling such a system of mutually dependent parts an *organism*. Indeed, Stahl was the first to do so in 1684 (Cheung 2006).

Origenes in the Renaissance

Pasquale Terracciano

Civiltà e Forme del Sapere, Università di Pisa, Pisa, Italy

Abstract

The study of Origen’s legacy is a fundamental investigation into the history of Renaissance philosophy and theology. Indeed, two of the most

characterizing cleavages in Renaissance culture (Pico's *Oratio de hominis dignitate* and Erasmus' *Free Will*) are strongly related with Origen's thought; more generally his presence extensively influenced many authors and innervated many debates (particularly on religious hermeneutics, on freedom of investigations, and on afterlife justice). Moreover, Origen assumed peculiar relevance in those calculations devoted to unveil the concord of all the traditions, including Hermeticism and Kabbalah.

Origen of Alexandria: Doctrines and Legacy

Origen of Alexandria was a Greek church father (184/185–254), a pivotal exegete of the Bible and the author of the first complete attempt to reconcile Christianity and Platonism, in the *De principiis* (whose original Greek text was partially lost). His principal apologetic work, the *Contra Celsum*, was a defense of the Christian doctrine against the thesis of the philosopher Celsus. According to Porphyry (*Life of Plotinus*, 3.20–38), the special competence of Origen in philosophy arises from the fact he was, along with Plotinus, a disciple of Ammonius. The large corpus of his *Commentaries* and *Homilies* on biblical texts, characterized by the awareness of the four-fold sense of the Scriptures (*De principiis*. 4.3.5), leaves a patrimony of interpretations that innervated Christian hermeneutics. Particular mention has to be reserved also to his *Hexapla*, a crucial biblical edition with six versions of the holy texts in parallel columns (Eusebius, *Church History* 6.1).

Origen's theological theory was grounded in the confidence in divine mercy and in the absolute man's free will. In *De Principiis*, Origen proposed a doctrine of the preexistence of the soul. Furthermore, he seemed to carry forth the idea of the flow of successive worlds and the final restoration of living beings in God (*apocatastasis*). For these reasons, according to a long-established (but harshly disputed) interpretation of his books, Origen was accused of denying eternal penances and supporting metempsychosis. Doctrines ascribed

to Origen of Alexandria on Trinity and eschatology were condemned in 553, though his influence as an allegorical exegete still remained very powerful. The legacy of Origen remained a debated question: Jerome, Augustine, Ambrosius, and Aquinas frequently referred to him, trying to harmonize his blessed exegesis and his wicked ideas on free will, predestination, afterlife, and Trinity. Both sides – the exegetical and the theological, even if suspected – left deep footprints in Western Christianity.

The name of Origen has conveyed, in the Christian sphere, the dissent toward the idea of the eternal penances. Thus, by “origenism” we mean first of all a robust theological optimism, which puts the emphasis on the mercy of God, coupled with the radical defense of human freedom; second, the allegorical reading of the holy texts, that often goes along with the comparison with the Platonic and Jewish tradition; and third, the subordination of the Son and the Holy Spirit to God.

Historiography

The centrality of Origen in works of theology, philosophy, and iconography of the fifteenth and sixteenth centuries was shown in a seminal article by Edgar Wind (1954). Daniel P. Walker, in the footsteps of Wind, studied the influence of Origen in sixteenth-century France as well as the wide diffusion of Origenistic themes in the English philosophical debate (Walker 1959, 1964). In more recent years, several scholars have mapped the “invisible omnipresence” (von Balthasar 1984, 2) of Origen in the theological and philosophical culture of the Renaissance (Godin 1982; Lettieri 2000; Scheck 2008; Terracciano 2012).

Origen in 1400

Starting from the middle of the fifteenth century, the circulation of the books of Origen witnessed a new spring, especially in Rome, in Venice and, above all, in neoplatonic Florence. The scrutiny in

the syncretic tradition and in the possible harmony of Moses and Plato contributes to explain the enthusiasm in his books. Marsilio Ficino, in *De Christiana religione* as well as in *Theologia Platonica*, relates enthusiastically Origen's engagement to the Platonic tradition. Origen was usually introduced as "a most noble Platonist" (*platonicus nobilissimus*) whose life and doctrine were admirable (Ficino *Theologia Platonica* V, 13; *De voluptate* [Ficino 1561 p. 994]; *De Christiana religione* [Ficino 1561 72]). Ficino was obviously also aware of Origen's complicated collocation at the boundaries of orthodoxy. The dangers of Origen's theological calculations – who seemed to adapt the words of Christ to those of Plato – were also denounced by Cardinal Bessarion (who, nevertheless, possessed several manuscripts from the Alexandrian Church Father) (Bessarion 1923 II, 5: 8).

A crucial date for the revival of Origen was 1481, when the *Contra Celsum* was printed in Rome. The printing was, to some extent, an ideological operation aimed to exalt the apologetic roots of Christianity, in the context of the difficult relationship with the Turks (Villani 2013), but it also testified to the growing interest in patristic culture. The printing of the *Contra Celsum* had an immediate impact on the Florentine culture. Ficino promptly used the doctrine of naming exposed in *Contra Celsum* in his *Argumentum in Cratylum*, in his *Philebus Commentary*, and in his *De Christiana religione* (Bacchelli 2001; Bartolucci 2008), to enforce his doctrine of divine names, according to the idea that the link between words and their meaning, on determinate conditions, is natural and not conventional. This doctrine was received by Pico in his *Question de Magia naturalis et de Cabala* and from then flow in the general account of the Christian Cabala.

However, the impact of Origen's thesis in Pico goes far beyond this element (Terracciano 2018). The similarity between the anthropology exposed in Pico's *Oratio* and the doctrine of the Church Father Origen of Alexandria, who preached the existence of the same soul for angels, devils, and man, whose movements were governed by the free will, has been supposed by a large scholarship. Edgar Wind wrote: "Although his doctrine is

not identical with Origen's in any detail, they have in common the assumption that man's place in the universe is not fixed, that he is able to move freely, up and down, between the angelic and the animal spheres, belonging to both and bound to neither" Wind (1954, 414). So, the Alexandrian arises, in some way, in a central position for a critical evaluation of Pico's doctrines, also because one of his *Conclusiones* disapproved by the Church in 1486 deals with Origen's afterlife destiny. The longest section of Pico's *Apology* is focused on the thesis that is "more rational to believe that Origen is saved, than to believe he is damned" (*Rationalibus est credere Origenem esse saluum quam credere ipsum esse damnatum*, Pico 2010, VII). The Pichian defense of Origen is centered on the idea that it is not possible to damn a man for ideas condemned after his death. Pico argued that even if Origen had suggested fallacious ideas, they concerned doctrines without definite evidence in the holy books or ones not included in the official credo, during his life. He states, in addition, that Origen had never written neither dogmatically or assertively but only in an inquiring spirit. On the contrary, the definition of heresy involves "pertinacity," which is an implausible allegation for his case. To explain the most unacceptable issues of Origen's doctrine, Pico returned to the traditional argument that proposed that the writings of the Father were corrupted by successive heretics (Crouzel 1965; Fürst and Hengstermann 2015; Mahoney 1994; Mariani 2014).

The debate exceeded the single Origen's case, involving the sovereignty of the Church on the afterlife and the definition of the dogma. It was stopped by papal censorship, and the theologian Pedro Garcia was charged with replying to the Pico's argument (Crouzel 1977). However, the Pichian defense represents a turning point for the Renaissance legacy of Origen and remained one of the pillars of the standard defense of the legitimacy of reading Origen.

The Sixteenth Century

In the sixteenth century, there was a massive spread of the Origenian works that had different

editions, principally in Venice (Manuzio, Lazaro de Soardis) and in Paris. In 1512 J. Merlin published the *Opera Omnia* of Origen, and he carries it with an *Apology* pro Origen. A few years later, the Sorbonne mounted an attack against Merlin, through the works of Christian Masseeuw and Noel Beda, which ended in the condemnation of Merlin's work (Schär 1979). One of the principal aims of the attack of Beda was indeed Erasmus of Rotterdam, who was getting ready to edit a new edition of the *Origenis opera omnia* that will be published, posthumously, in 1536. Erasmus was an enthusiastical admirer of the Church Father, to the point that by writing that one page of Origen could teach him more than ten pages of Augustine (III, Ep. 844, 337, p. 252–254). Erasmus, with his commitment to the idea that faith is a continuous progress and that hermeneutics needs philology and allegory, with his purpose to restore faith in God's mercy and man's freedom, was the champion of Renaissance Origenism; indeed according to Febvre, "*c'est qu'entre temps, Origène était devenu Erasmién, ou Erasme origéniste*" (Febvre 1942). He was deeply indebted to Origen's interpretations: the *Dialogue on the Free will* is strongly based on Origen's *De Principis* and on *Commentary on Romans* in dealing with the crucial exegesis of the Pauline sentences on grace (Godin 1982; Scheck 2008; Terracciano 2012). From his point of view, Luther totally rejects the interpretations of Origen, considered by him an absolutely unreliable and misleading commentator. In fact, the tenacious refusal of allegorical interpretation of the Scriptures, which Origen was among the first to adopt, is added to the condemnation of the specific doctrines. For this reason, also Melanchthon identified in the *Origenica aetas* (the period from the II to the III century) the age of the initial distortion of Christianity and the beginning of the decline with respect to the initial Pauline spirituality. This was the view of the most part of the reformers on Origen, with the partial exclusion of Zwingli and Butzer (Terracciano 2012; Fallica 2016).

Origen's fortune was not only confined to the debate on free will. Bonaventure des Périers, in

Cymbalum Mundi, uses the *Contra Celsum* as a doxographic work, in order to find the arguments for his anti-Christian satire (Febvre 1942). For Francesco Zorzi, the interest in Origen derives conversely from his role as cultural broker of the different ancient wisdoms. Specifically, following the path of Giovanni Pico's interpretation, he considered Origen the Christian exegete most familiar with the secret philosophical doctrines of the Jews. In the same way, Jean Bodin used it extensively in his *Colloquium heptaplomeres*.

Origen was also a fundamental author for Giordano Bruno and Tommaso Campanella. Bruno's dialogue with Origen develops along three axes: doxographic, hermeneutic, and eschatological (Terracciano 2014). Origen is the Father of the Church who most often appears (at least according to direct occurrences) in the Brunian corpus, associated with some images and doctrines that are well established in the tradition: a hermeneutical tendency based on the search for allegorical meanings (Bruno 2000a, 687); the doctrine of universal vicissitude, an element that is linked to metempsychosis (Bruno 2000a, 770, *De minimo* I, 3, p. 143); the demonological vision, also not separated from heterodox visions of the destiny of souls (Bruno 2000b 43); and the conceptual closeness, derived from the elements mentioned, with the Pythagorean and Cabalist doctrines (Bruno 2000a, 770). Campanella, in the *Ethica*, compares Origen to Columbus and Galileo, for his craving for knowledge, and, furthermore, he extensively used the author of *De Principiis* to make modern philosophical-scientific progress compatible with his view of the Catholic tradition (Lettieri 2000).

Osiander, Andreas

Born: 19 December 1498, Gunzenhausen (Bavaria)

Died: 17 October 1552, Königsberg (Prussia)

Tomáš Nejeschleba

Centre for Renaissance Texts, Department of Philosophy, Faculty of Arts, Palacky University Olomouc, Olomouc, Czech Republic

Abstract

Andreas Osiander was a Lutheran theologian of the first generation of reformers. He was a preacher and worked as a teacher of Hebrew in Nuremberg. He is renowned in theology due to his polemics with Martin Luther and Philipp Melanchthon concerning the doctrine of justification, which seems to be influenced by Paracelsus and Renaissance Neoplatonism. In his exegetical works, Osiander followed the cabalistic techniques of Giovanni Pico della Mirandola and Johannes Reuchlin. His editorial works are the most famous. Osiander prepared the first edition of Nicolaus Copernicus's *On the Revolutions of the Heavenly Spheres* (1543) which he anonymously introduced with a preface suggesting that the work was more of a mathematical model than a description of reality. Due to this he has been called either the enemy of science or the founder of an instrumentalism in the philosophy of science. Osiander's edition of Girolamo Cardano's mathematical work *Ars Magna* (1545) also attracted particular attention.

Biography

Andreas Osiander studied at the university in Ingolstadt where he was influenced by the humanistic principle of exegesis. He never finished his university studies but did leave with an ongoing interest in mathematics and Hebrew, including the Kabbalah. In 1519 Osiander moved to Nuremberg where he taught Hebrew and became an ardent

proponent of Martin Luther's reformation. As an acclaimed preacher, he had a substantial influence on the city council. Osiander took part in important theological negotiations of his time: at the Marburg Colloquy in 1529 and at the Diet of Augsburg in 1530. Due to his resistance to the Augsburg Interim in 1548, which reestablished the imperial and papal authority over certain imperial cities, Osiander was forced to leave Nuremberg and settled in Prussian Königsberg. He died in the midst of his sharp polemics with Lutheran orthodoxy and Philipp Melanchthon.

Humanism and Christian Kabbalah

Osiander adhered to the humanistic maxim "back to the sources" (*ad fontes*) and praised Erasmus of Rotterdam as the most important humanist of his time. In order to facilitate the exegesis of Holy Scripture, he emphasized the importance of understanding Hebrew. Influenced by his Ingolstadt teacher of Hebrew, Johannes Böschenstein, and partially also by the Christian cabalist Johannes Reuchlin, Osiander used cabalistic techniques, such as tetragrammaton, gematria, and notarikon in his theological work *Harmonica Evangelica* (1537) (Schubert 2014). In this book Osiander applied a musical theoretical concept of harmony on exegetical problematic seeking of the harmony between gospels.

Osiander followed Giovanni Pico della Mirandola's conception of the ancient wisdom (*prisca sapientia*). He quotes Pico's work *Conclusiones* and his theses on Kabbalah in particular. Osiander, however, did not develop Pico's syncretic philosophy. Christian Kabbalah and quotations from Pico helped him to improve the exegesis of the Scripture and to determine events in the future, so-called conjectures. In the book on conjectures (*Coniecturae de Ultimis Temporibus ac de Fine Mundi*, 1544), he may have been influenced by Pico and by Nicolaus of Cusa concerning the title of the work. Unlike Pico's emphasis on anthropocentrism, Osiander rethought the Cusanus' notion of the "coincidence of opposites" in a theocentric and Christocentric way. He rejected a spatial center of the universe

and stressed its temporal center in the historical-eschatological interpretation of Cusanus' principle (Wrightsmann 1975).

Editorial Work: Copernicus and Cardano

Entrusted by Nicolaus Copernicus and his pupil Johannes Rheticus, Osiander edited in Nuremberg Copernicus' fundamental work *De revolutionibus orbium caelestium* (1543). According to an older interpretation, Osiander's work on the edition was connected with his astrological interests (Hirsch 1919). This interpretation was later denied (Seebass 1967), and his mathematical motivation with a theological goal is instead suggested as the reason for his involvement. A better mathematical model as constructed by Copernicus could lead to a more accurate calendar which could help to specify exact conjectures of future events (Wrightsmann 1975).

Osiander published Copernicus' book together with his own but anonymous introduction *Ad Lectorem*. Herein Osiander interprets Copernicus' heliocentric model as a mathematical hypothesis whose aim is only the prediction of phenomena. This view is based on the understanding of mathematical astronomy aiming to "save the appearances" (Duhem 1969). A mathematical model can be constructed freely since the goal of astronomy is not the description of the world as real but only the prediction of future events. Osiander created a hierarchy of sciences according to the certitude of knowledge. Astronomy (mathematics) occupied a lower position as it was based on observations and thought not to be able to attain knowledge of real causes. Natural philosophy was assigned to the second level as a probable knowledge of its cause could be ascertained. Only theology stemming from revelation was deemed to be able to provide knowledge with an absolute degree of certitude.

Following the "saving appearances" hypothesis, Copernicus' heliocentric theory therefore should be put on the same level of credibility as the mathematical astronomy of Ptolemy. Copernicus' heliocentrism, however, seems to be more appropriate for astronomical predictions according to Osiander. This view on heliocentrism

provoked a disagreement with Johann Rheticus, who was initially asked to edit the book of Copernicus and held a realistic position concerning heliocentrism. The debate around Osiander's short *Ad Lectorem* flamed up at the end of the sixteenth century and still continues today.

In 1545 Osiander edited *Ars Magna*, a mathematical work by Girolamo Cardano, where the solution of cubic equations was formulated. Cardano held Osiander in high esteem as a mathematician and praised the emendations he made to his text. In addition, Osiander and Cardano allegedly exchanged horoscopes and astrological notions (Hirsch 1919) although this is not evidenced in Osiander's correspondence (Osiander 1975–1997).

New Alchemistic Theology

In theology Osiander was an unorthodox follower of Martin Luther and often polemicized with the central reformation figures. The biggest controversy surrounding Osiander arose from his theory of justification. Osiander refuted the "forensic" justification of sinful man by means of grace and coined an "effective" justification by means of the indwelling of God's word in man. The doctrine of Christification and divinization of man is based on the alchemistic ideas of transformation and perfection of human nature and displays a similarity with Paracelsus (Goldammer 1972). It was probably formulated by Osiander independently from Paracelsus although they did share some of the common fundamentals present in Neoplatonic philosophy. One influence could have come from his positive attitude to the tradition of *Prisca sapientia* which also shares universalistic tendencies with Raymundus Lullus in the identity between God's power and God's justice (Hirsch 1919).

Legacy

Osiander's theological views advocated by so-called Osiandrists were condemned by Lutheran orthodoxy after his death, and the author

and his follower were connected with Paracelsian alchemistic theology and with Weigelianian heresy.

His methodological approach to Copernicus was initially accepted by Lutherans in the so-called Melancthon circle (Westman 1975). Later, Giordano Bruno sharply denounced Osiander's view on Copernicus in his dialogue *Ash Wednesday Supper* not knowing the authorship of the preface. The identity of Osiander as the author of *Ad Lectorem* was first uncovered by Johannes Kepler who advocated the realistic meaning of Copernicus' heliocentrism. From the correspondence between Osiander, Rheticus, and Copernicus quoted by Kepler (Jardine 1988), it could be deduced that Osiander's reason to introduce Copernicus using the preface was to prevent condemnation by theologians and Aristotelians (Duhem 1969). From the beginning of the seventeenth century, Osiander was often viewed as an enemy of heliocentrism and of science as such. However, in the philosophy of science of the twentieth century, Osiander became a significant figure due to his so-called instrumentalistic or fictionalistic attitude to scientific theories opposing the realistic position. According to instrumentalists a theory provides only a device for computing and for predictions of phenomena, while realists consider a theory as a statement reflecting reality. In this sense Osiander was included by Pierre Duhem into the movement of the "savers of phenomena" (Duhem 1969). At the same time, Duhem also considers Osiander's approach as being common in modern science (Gingerich 1973; Graubard 1964). Concerning the philosophy of science, Osiander's initial role in the birth of instrumentalism was emphasized by Karl Raimund Popper, who advocates realism and considers instrumentalism as a dogma stemming from Osiander, Bellarmine, and George Berkeley (Popper 1965). Instrumentalism was on the other hand advocated by Paul Feyerabend with a reference to Osiander (Feyerabend 1999). Despite of the importance of Copernicus and Osiander's preface to his work, the application of modern concepts of instrumentalism and realism to the sixteenth-century philosophy and science is viewed as anachronistic (Barker and Goldstein 1998).

Osório, Jerónimo

Born: Portugal, 1514

Died: Tavira, Portugal, 1580

Thomas Earle

University of Oxford, Oxford, UK

Abstract

Easily the best-known Portuguese writer in sixteenth-century Europe, Osório engineered wide exposure for his many books, on a variety of topics, but all of them in Latin. He was educated outside Portugal, including a particularly formative period in Bologna, but most of his life was spent in his own country, where for more than 20 years he was bishop of the Algarve.

Though not an original thinker, Osório's ability to convey orthodox Catholic beliefs in elegant Latin prose brought him many readers, including in the Protestant world. His early works of the 1540s, *On Civil and Christian Nobility* and *On Glory*, show him to have been a Christian humanist, with an unusual (for Portugal) interest in and knowledge of the work of Homer. However, he could not accept the work of the classical philosophers because it was not based on revealed religion. He was also profoundly critical of Machiavelli, on the grounds of his hostility to Christianity.

Osório was also well known, especially in England, for his open letter to Queen Elizabeth, who he tried to persuade to return to the faith of her ancestors. It led to a polemic with Anglican theologians which lasted for many years. His writings about kingship do not move very far from the ideas of St Thomas Aquinas.

Biography

After early studies in Salamanca and Paris, Osório spent two formative years in Bologna (1540–1542) where he met the Spaniard Antonio Agustín and the Frenchman Jean Matal, contacts of great value to him as he became an internationally famous writer. Apart from a year in Rome (1576–1577), the rest of his life was spent in Portugal, at first in court circles, and from 1564 in Silves and in Faro, as bishop of the Algarve.

Works

Osório wrote almost exclusively in Latin. His early works, *De nobilitate civili et christiana* (*On Civil and Christian Nobility*, 1542) and *De Gloria* (*On Glory*, 1549), are concerned with social and political questions. He also wrote works of: (1) religious polemic, most notably his letter to Elizabeth I of England, in which he tried to persuade her to return to the Catholic faith (1563) and *De Religione* (*On Religion*, 1567), which is a reply to Walter Haddon's defense of the queen; (2) a contribution to the theory of kingship, *De regis institutione* (*On the Institution of the King*, 1571–1572); (3) a famous history of the Portuguese discoveries (1571), essentially an adaptation of Damião de Góis's *Crónica de D. Manuel*; and, towards the end of his life, (4) works of Biblical scholarship, most easily consulted in his *Opera Omnia* (Rome, 1592).

Heritage and Rupture with the Tradition

In his controversies with the English Protestants, Osório maintains a strictly orthodox position with regard to such issues as the supremacy of the Pope, the importance of the religious orders, the necessity of good works, the doctrine of purgatory, the cult of the saints, etc. (Pinto 2006). Except insofar as he supported the doctrines of the Council of Trent, which had only been very recently formulated, it is difficult to see him as breaking with tradition.

Innovation and Original Aspects

Osório's two works of the 1540s on nobility and glory show him to have been a Christian humanist. Unusually for a Portuguese writer he has a good knowledge of Homer, and he can see a poetic truth in Homer's heroes, despite or even because of their mythological origin as the offspring of the pagan gods (Osório 1996). However, he is less tolerant of ancient philosophy which he condemns for its failure to acknowledge the truth of revealed religion (Osório 2005). It is in the name of religion also that he attacks Machiavelli, whose *Discorsi* on the first decade of Livy's History of Rome he seems to have known (Osório 1996). The more liberal side of humanism appears in his attitude to nobility which, since it is ultimately based in virtue, can be acquired by anyone.

Osório's theory of kingship is based on Aquinas's *De regimine principum*, though in deference to Portuguese tradition, he does not favor the election of the monarch. In *De regis institutione*, Osório also shows a concern for the contemporary political reality in Portugal, which was ruled by the youthful and inexperienced King Sebastião (Soares 1994).

Impact and Legacy

Outside Portugal, Osório was easily the best known Portuguese writer of the Renaissance. His ability to give voice to orthodox and mainline Catholic opinion in elegant Latin prose brought him many admirers, even in Protestant Europe. There are a great many editions of his books, mostly printed in Catholic centers like Cologne and Lyon. He was already known in England before his famous controversy with Queen Elizabeth, and Cardinal Pole, the last English cardinal before the Reformation, hoped to see *De nobilitate civili et christiana* translated into English. A translation appeared in 1576, many years after Pole's death in 1558. The book, usually in its original Latin, and the accompanying *De Gloria* can be found even in the libraries of English undergraduates of the period. However, the book which best stood the test of time was the history of the discoveries, an adaptation of a chronicle by

Damião de Góis which, either in Latin or in the French translation of 1581, still found readers in the eighteenth century (Earle 2009).

Ottoman Philosophy

Khaled El-Rouayheb

Department of Near Eastern Languages and Civilizations, Harvard University, Cambridge, MA, USA

Abstract

Modern scholarship on the history of Ottoman philosophy is in its early stages. For much of the twentieth century, the dominant

presumption was that there was little to study. Philosophy, it was believed, had been repudiated by mainstream Sunni Islam in the eleventh and twelfth centuries and henceforth only survived among the Shiites and enjoyed a silver age in Safavid Iran (1502–1722). Specialists have now largely challenged this view. Admittedly, there were few who openly identified as “philosophers” (*falāsifa*) in the Sunni Islamic world after the thirteenth century. But this was largely because *falsafa* tended to be understood as a school of thought rather than a specific discipline. The *falāsifa* were those who adhered to Neo-Platonism or Neo-Platonized Aristotelianism. They upheld the theologically problematic theses of the eternity of the world, that God does not possess knowledge of material particulars in the sublunary world, and the denial of bodily resurrection. Philosophy in the sense of a discipline committed to the rational discussion of metaphysics, physics, logic, and ethics continued unabated in later centuries.

The present article will begin with a brief historical introduction, followed by an outline of Ottoman scholarship in these four subdisciplines. The survey will be mainly historical and bibliographic. Given the early state of research, it is simply not feasible to structure the presentation on the basis of the ways in which Ottoman contributions to the rational sciences were or were not innovative.

Historical Context

The Ottomans emerged in the course of the fourteenth century as the most powerful of the many Turkish polities (*beyliks*) that emerged after the fall of the Seljuk Sultanate of Anatolia. It attracted numerous scholars in search of positions and patronage, especially from Persia and Central Asia. Until the mid-fifteenth century, ambitious Ottoman students often went to Cairo, then under Mamluk rule. For these reasons, scholarship within the early Ottoman realm was continuous with those of the wider Islamic world, and it is difficult to speak of a distinct Ottoman tradition of philosophy prior to the second half of the fifteenth

century. During the reign of Meḥmed II (1451–1481), this began to change. The Sultan established the “Eight Schools” (*Ṣaḥn-i Themān*) in Istanbul and discouraged scholars of his realm from studying in Cairo. The emergence of the Safavid dynasty in Persia in 1502 also contributed to the formation of a distinctive Ottoman scholarly tradition. In the short term, the ascendance of the Shiite Safavids led even more Persian scholars – Sunnis fleeing persecution – to come to the Ottoman lands. In the longer term, it resulted in the severance of scholarly ties and put an end to the stream of Persian immigrant scholars. After the sixteenth century, scholarly relations with Iran were negligible. The Iranian philosophers Mīr Dāmād (d.1631) and Mullā Ṣadrā (d.1635), for example, were not nearly as influential in the Ottoman environment as they were in Iran and the Indian subcontinent.

This does not mean that the study of philosophy was adversely affected. An older view among some Ottomanists held that the cultivation of the rational sciences ceased after the sixteenth century as a consequence of the rise of the “fanatical” *Ḳāḏīzādeli* movement in the early seventeenth century. Recent scholarship has rejected this view. Although the *Ḳāḏīzādelis* were vigorously opposed to Sufi theosophy, popular syncretic practices, and general religious laxity, it is not clear that they were systematically opposed to the rational sciences. In any case they remained a minority even among the class of Ottoman religious scholars (*ulema*). The rational and philosophical sciences continued to be cultivated until the downfall of the Ottoman Empire.

Metaphysics and Natural Philosophy in the *Madrasas*

The study of metaphysics and natural philosophy took place in a number of contexts. One was the colleges (*madrasas*) in which Ottoman students were trained in a range of scholarly disciplines, usually on the basis of handbooks written in Arabic by thirteenth and fourteenth-century scholars active in Persia and Central Asia. Two handbooks of rational theology (*kalām*) that were extensively studied in Ottoman madrasas were the *Tajrīd*

al-i'tiqād by Naṣīr al-Dīn al-Ṭūsī (d.1274) and the *al-Mawāqif* by ʿAḍud al-Dīn al-Ījī (d.1355). Both works and the standard commentaries on them dedicated considerable attention to philosophical preliminaries. Both included an early section on “*metaphysica generalis*” (*umūr ʿamma*) that dealt with existence, essence, and causality. A section on substances and attributes (*jawāhir wa aʿrād*) followed, including a discussion of the Aristotelian categories. These philosophical sections elicited numerous glosses by Ottoman scholars, for instance, Ḥasan Çelebī Fenārī (d.1481) and Ḥaṭībzāde (d.1495). Some of the issues raised also became the subjects of independent treatises. The Ottoman scholar Ṭāşköprüzāde (d.1561), for example, produced treatises on the four Aristotelian causes, on the problem of universals, and on mental existence (*wujūddhihnī*).

Not all *madrasa* handbooks that covered metaphysics and natural philosophy were formally works on theology. The *Hidāyat al-ḥikma* by Athīr al-Dīn al-Abharī (d.1265) was an introduction to logic, natural philosophy, and metaphysics. Especially the section on natural philosophy was studied intensively, along with the commentary of the Persian scholar Qāḍī Mīr al-Maybudī (d.1504) and the gloss of the Persian-born Ottoman scholar Muşliḥ al-Dīn al-Lārī (d.1571). The commentary and gloss became the subject of numerous super-glosses by later Ottoman scholars, for example, Ẹara Ḥalīl (d.1711), Meḥmed Kefevī (d.1754), and Ismāʿīl Gelenbevī (d.1791). These discussed at length issues such as atomism, hylomorphism, space, void, motion, and time.

The intensive scrutiny of metaphysics and natural philosophy did not lead Ottoman scholars to depart from mainstream condemnations of what they called *falsafa*. At the behest of Sultan Meḥmed II (1451–1481), Ḥōcazāde (d.1488) and ʿAlāʾ al-Dīn al-Ṭūsī (d.1482) wrote works assessing – on the basis of rational argumentation – the classic attack on the *falāsifa* by the theologian al-Ghazālī (d.1111). Though they expressed disagreement on various points of detail with al-Ghazālī and with each other, they both firmly refuted the theses that the world is eternal, that only the soul survives death, and that God’s knowledge is limited to unchanging universals.

Metaphysics and Natural Philosophy Outside the Madrasas

Alongside this madrasa tradition, there were two further important contexts in which metaphysics and natural philosophy were discussed. One was in works belonging to the tradition of Sufi theosophy going back to the Andalusian mystic Ibn ʿArabī (d.1240) and his disciple Ṣadr al-Dīn al-Qūnawī (d.1274). Especially the former’s *Fuṣūṣ al-ḥikam* was studied in Ottoman mystical circles and elicited numerous commentaries, for example, by Bālī Efendī (d.1552) and ʿAbdullāh Bōsnavī (d.1644). Among the Mevlevī Sufi order, there was also interest in the anti-Peripatetic Neo-Platonism of al-Suhrawardī (d.1191). A Turkish commentary on his *Ḥayākil al-nūr* was written by Ismāʿīl Anḳaravī (d.1631).

In the seventeenth century, there was some interest in European learning, especially in circles close to the Ottoman court. The *Basilica Chymica* of the Paracelsian physician and alchemist Crollius (d.1609) was translated into Arabic by Ṣālīḥ Ibn Sallūm (d.1670), a court physician to Meḥmed IV (r. 1648–1687). The *Atlas minor* of Hondius (d.1612) was translated into Ottoman Turkish by Kātib Çelebī (d.1657), and an Ottoman translation of Blaeu’s (d.1638) *Atlas maior* was produced by Ebū Bekr Dimaşķī (d.1691). The *Physics* of Aristotle was retranslated into Arabic by Esʿad Yānyavī (d.1731), along with the commentary of the Greek-born, Paduan Aristotelian Johannes Cottunius (d.1657).

Logic

The study of logic was a key component of the curriculum of the Ottoman *madrasas*. The handbooks that were studied all belonged to a broadly “post-Avicennan” tradition, in the sense that they took their departure in the (Arabic) works of thirteenth- and fourteenth-century Persian logicians who were deeply influenced by – though not uncritical of – Avicenna (d.1037). The basic organizing principle of those works was to divide their presentation into two main sections: the first, on “conceptions” (*taṣawwurāt*), dealt with linguistic preliminaries, the five universals, and

definition, and the second, on “assents” (*taṣdīqāt*), was concerned with propositions, their immediate implications, and the syllogism. Little or no attention was given to the Aristotelian categories or the “matter” of the syllogism (demonstration, rhetoric, topics, poetics, sophisms).

A widely used introductory handbook was the *Īsāghūjī* by al-Abharī (d.1265), the above-mentioned author of *Hidāyat al-ḥikma*. The Ottoman scholar Meḥmed Fenārī (d.1431) wrote a much-studied and much-glossed commentary on this work. A more advanced handbook was the *Risāla al-Shamsiyya* by Najm al-Dīn al-Kātibī (d.1276), which gave an extensive presentation of modal logic. Commentaries on it were written by the Ottoman scholars ‘Allāmek Bōsnavī (d.1636) and Muṣṭafā Mōstārī (d.1707).

In the course of the seventeenth century, the *Tahdhīb al-manṭiq* by Sa’d al-Dīn al-Taftāzānī (d.1390) also came to be studied, along with the commentary of Jalāl al-Dīn al-Dawānī (d.1502) and the gloss of Mīr Abū l-Faṭḥ al-Ardabīlī (d.1568). The focus was on the early sections of the work dealing with the definition of knowledge, its division into conception and assent, the division of each into evident and acquired, and the purpose and subject matter of logic. A number of Ottoman scholars, such as Kara Ḥalīl (d.1711) and Ismā’īl Gelenbevī (d.1791), wrote extensive super-glosses that delved into such topics.

In the eighteenth century, two esteemed handbooks on logic were written by Ottoman scholars: the *‘Arā’is al-nafā’is* by Ebū Sa’īd Ḥādīmī (d.1762) and *al-Burhān* by Ismā’īl Gelenbevī (d.1791). Both include, among other things, innovative discussions of categorical syllogisms with more than three terms, such as the following inferences:

This is a rational animal
Every animal breathes
 This breathes

This is the slave of a man
Every man is human
 This is the slave of a human

Ethics

Ethics was, unlike metaphysics natural philosophy and logic, not a standard *madrassa* discipline. Perhaps the major Ottoman contribution to the field was the *Aḥlāk-i ‘Alā’* by Ḳınālızāde (d.1571), written in Turkish and dedicated to an Ottoman governor of Damascus. This was influenced by earlier Persian works on ethics by Naṣīr al-Dīn al-Ṭūsī (and Jalāl al-Dīn al-Dawānī). Also influential was a short treatise in Arabic by ‘Aḍud al-Dīn al-Ījī (d.1355), which elicited commentaries by the aforementioned Ṭāṣköprüzāde (d.1561) and Aḥmed Münecimbāşı (d.1702).

centuries. Like its equivalent in Western historiography, however, the term “Renaissance” in Ottoman history has multiple, overlapping and sometimes contradictory meanings that vary widely depending on context. Also in common with its Western equivalent, the term is anachronistic in the sense that it has been applied only retrospectively to the Ottoman period by modern scholars. While the roughly analogous concept of *tejdīd* or “renewal” did play a role in fifteenth and sixteenth-century Ottoman depictions of their own age, the term “Renaissance” per se was unknown among Ottoman intellectuals until the nineteenth century.

At a conceptual level, the Ottoman Renaissance is therefore analogous to many other moments of cultural vibrancy and rediscovery that modern scholars have chosen to describe with similar language, such as the “Carolingian Renaissance,” the “Bengal Renaissance,” or the “Harlem Renaissance” (Goody 2010). However, unlike such strictly comparative uses of “Renaissance,” the Ottoman case is unique in that the Ottomans were both contemporaries and neighbors of Renaissance Europeans, with whom they remained in constant contact throughout their history. As a result, it is in exploring the possibilities of dialogue and mutual influence between Ottoman and European intellectuals, artists and patrons – or, alternatively, in the denial of such dialogue or influence – that modern scholars have found it most useful to speak of the Renaissance with reference to the Ottomans.

Ottoman, Renaissance

Giancarlo Casale

Abstract

The Ottoman Renaissance refers to the period of Ottoman history coinciding with the European Renaissance of the fifteenth and sixteenth

Innovative and Original Aspects

Since the Ottoman Renaissance is a historiographical as much as a historical phenomenon, the question of its innovative and original aspects is best approached through a discussion of the various ways it has been employed in modern scholarship. For the sake of clarity, these have been divided into three dominant scholarly paradigms that are each described separately below. It should be emphasized,

however, that these descriptions are intended as only rough approximations of an evolving body of scholarship that is in reality a great deal more varied and dialogic than the summary presented here.

Paradigm #1: The Ottoman Renaissance as “Anti-Renaissance”

The most traditional way to understand the Ottomans’ relationship to the Renaissance is to describe their role in essentially negative terms: not as participants in the Renaissance per se, but rather as powerful agents who shaped its contours from without through their military expansiveness and their implacable hostility to European culture and to Western Christianity. For many generations of scholars, for example, it seemed self-evident that Ottoman advances into Byzantine territory, culminating with the conquest of Constantinople in 1453, did not simply coincide with the flourishing of Italian humanism but were in fact its proximate cause – forcing the flower of Byzantium’s intelligentsia into Italian exile at precisely the moment in which an interest in Greek learning had begun to take root there (Geanakoplos 1989).

In more recent decades, scholars have become less likely to assert such a direct, functional link between Ottoman conquests and the rise of the Renaissance in Italy. But a newer readaptation of this paradigm can be observed in the burgeoning rise of scholarly interest in Renaissance “representations” of the Ottomans in realms as varied as history, literature, art, and political theory. A common aim of such scholarship, despite the considerable diversity of its subject matter, is to reassert the Ottomans’ negative role in the formulation of certain key aspects of Renaissance intellectual life by providing Europeans with a concrete example of a neighboring society that was familiar yet somehow lacked the essential characteristics of Western civilization. In other words, only by looking at themselves through the lens of the Ottoman “other,” it is argued, could the elites of Renaissance Europe consolidate a collective identity based on reverence for Greco-Roman antiquity, membership in the Republic of Letters, respect for the traditions of

classical philosophy, and other aspects of a nascent European sense of self that went beyond simple adherence to Christianity (e.g., Meserve 2008; Bisaha 2004; Valensi 1987).

Paradigm #2: The Ottoman Sultan as “Renaissance Despot”

A second and quite distinct understanding of the Ottoman Renaissance characterizes the Ottomans not as external antagonists but rather as active participants in Renaissance intellectual life, with a particular emphasis on the Ottoman court as a center of literary and artistic patronage. In its origins, this idea can be traced back to the foundational nineteenth-century historian Jacob Burckhardt, who had posited an Islamic ancestry for certain aspects of “Renaissance Despotism,” his term for the characteristic political culture of fifteenth-century Italy (Burckhardt 1860; Makdisi 1990). By the twentieth century, elements of Burckhardt’s thesis became a part of Ottoman historiography as well, notably in the work of the Orientalist Franz Babinger. In his authoritative biography of Sultan Mehmed “the Conqueror” (r. 1451–1481), for example, Babinger openly invoked Burckhardt in his portrayal of Mehmed and directly compared the Sultan to Ferrante of Naples, Caesar Borgia, and other contemporary “despots” of Renaissance Italy (Babinger 1953).

Admittedly, Babinger’s interest in making such comparisons was primarily to explain Mehmed’s reputed lack of religious scruples and his easy recourse to violence. But an expanding body of scholarship in more recent decades has focused instead on the cultural aspects of Mehmed’s “despotism.” As a result, Mehmed’s record as a patron of the arts and letters is now understood, at least in part, as a self-conscious attempt to use the language and the symbolism of the Renaissance to present himself as a latter-day Roman emperor (*Kaysar-ı Rûm* in Turkish) capable of restoring Constantinople to its rightful place as “the New Rome.”

Even as a child, in fact, it is now known that Mehmed had instruction in both Greek and Latin, and this early training continued to shape his patronage throughout his later life. Following his conquest of Constantinople, the numerous Greek

manuscripts known to have been commissioned for his personal library include the *Iliad*, Arrian's *Anabasis*, and Ptolemy's *Geographia*. And as his reputation as a patron grew, he also became the focus of a number of classicizing, eulogistic texts composed by literati in the hopes of securing his favor. These include Kritovoulos of Imbros's *History of Mehmed the Conqueror*, a Greek text in which Mehmed is described as "philhellene" in the model of Alexander the Great, and Giovanni Maria Filelfo's similarly conceived *Amyris*, a 4,000-verse Latin poem that compared Mehmed to Hannibal and Cyrus. Meanwhile, an analogous set of "humanistic" sensibilities characterized many other areas of cultural production during Mehmed's reign, ranging from the visual arts to architecture (Raby 1983; Brotton and Jardine 2000; Necipoğlu 2012).

After Mehmed's death, his two immediate successors to the throne, Bayezid II (r. 1481–1512) and Selim I "the Grim" (r. 1512–1520), seem to have been comparatively less interested in styling themselves as "Caesars," such that the glorification of Greco-Roman antiquity in the mode of contemporary Italian art and literature became a much less prominent feature of Ottoman court culture during their reigns. But a noteworthy revival of this style of imperial patronage took place following the accession to the throne of Mehmed's great-grandson Suleiman "the Magnificent" (r. 1520–1566), a movement spearheaded by Suleiman's supremely powerful grand vizier, Ibrahim Pasha (d. 1536).

Born a subject of Venice in the eastern Adriatic, Ibrahim's efforts to associate both himself and his sovereign with Constantinople's rebirth as the "New Rome" were perhaps even more overtly shaped by Italianate ideals of the Renaissance than those of Sultan Mehmed. He was aided in this project by Alvise Gritti (d. 1534), the illegitimate son of the Venetian Doge Andrea Gritti (r. 1523–1538), who had sired Alvise while stationed in Constantinople as a diplomat. With Ibrahim's encouragement, Alvise's residence in the Ottoman capital became something of an Italian Humanist court in miniature, frequented by figures such as Tranquillo Andronico, the brothers Agostino and Giuseppe

Museo, and Francesco della Valle. And as had been the case in Mehmed's reign, such patronage was matched in other realms of cultural production as well. Among Ibrahim's most visible public gestures as a builder, for example, was to construct a grand personal residence at the Hippodrome, the long-neglected site of the Emperor Constantine's own imperial palace, whose garden he decorated with bronze statues of Hercules, Apollo, and Diana captured from the Hungarian royal palace in Buda (Finlay 1984; Turan 2007).

Subsequently, for reasons that continue to be debated by historians, Ibrahim Pasha fell precipitously out of favor and was executed by the Sultan in 1536. Although some lingering effects of his influence would continue to be felt, the Ottoman court's role as an important center of patronage for artistic, literary, and scholarly projects directly inspired by the ideals of Western humanism gradually came to an end. But even in Ibrahim's absence, Ottoman Constantinople would continue to be the center of an entirely different "Renaissance," rooted in the intellectual traditions of Islam rather than the Greco-Roman world.

Paradigm #3: The Ottoman Renaissance as "Islamic Renaissance"

It is only comparatively recently that scholars have begun to question the essentially "Islamic" character of Ottoman society, which was long assumed to have been a constant throughout Ottoman history (at least until the nineteenth century). Far from enjoying a seamless continuity with the intellectual traditions of the Abbasid Caliphate (750–1258 C.E.), however, it has become increasingly apparent to specialists in the field that the Ottomans were in fact surprisingly unfamiliar with many aspects of Islam's classical literary corpus until comparatively late in their empire's rise to power. As a result, Ottoman learned elites are now understood to have "rediscovered" this classical corpus and to have systematically appropriated it as their own through a process of reproduction, translation, canonization, and emulation that mirrors Italian Renaissance humanism in several important respects.

The origins of this Islamic Renaissance can be traced to the mid-fifteenth century, and

significantly, the sultan most closely connected with its early promotion was once again Mehmed the Conqueror. A surviving inventory of Mehmed's personal library, for example, features over 8,000 manuscripts in Arabic, Persian, and other eastern languages and includes an especially large number of titles related to the life of Alexander the Great, to philosophy and political theory in the Arabo-Aristotelian tradition, and to related works in the fields of geography and cosmography. As such, the list reveals a body of interests that are largely complementary to the numerous Latin and Greek texts that Mehmed collected or commissioned during the same period, and should be understood as the product of a wider, self-consciously "cosmopolitan" pattern of patronage that sought to combine Eastern and Western literary and artistic traditions in a new imperial synthesis. Broadly in keeping with these cultural ideals, it should also be noted that Mehmed showed a consistent preference for "classical" languages. As such, he showed comparatively little interest in works in the Turkish vernacular, and even when commissioning translations of Greek and Latin texts, he requested translations into Arabic rather than Turkish (Necipoğlu 2012; Raby 1983).

Importantly, Mehmed seems to have used this "cosmopolitan" pattern of patronage to both reflect and legitimize his larger administrative practices, particularly his controversial policy of reserving top government postings for former Byzantine converts, Western renegades, Iranian immigrants, and other "outsiders" at the expense of freeborn Turkish-speaking Muslims (Babinger 1953). But in the decades after Mehmed's death, a new cadre of *madrassa*-trained, urban, Turkish-speaking literati began to flex their collective muscles in opposition to such policies. By the middle of the sixteenth century, they succeeded in establishing Turkish not only as the primary administrative language of the empire but also, for the first time in history, as a major medium of literature and scholarship (Kuru 2012).

Several aspects of this development have striking resonance with the trajectory of the European Renaissance. Firstly, although the members of this new imperial elite used eloquence in Ottoman

Turkish as a central marker of their collective identity, the moniker that they chose for themselves was not "Turkish" but rather "Roman" (lit. *Rūmī*). As such, they by no means rejected the idea, originally championed by Mehmed, that the Ottoman state was the New Rome and the Sultan its new Emperor. Instead, they presented an alternative chronology and taxonomy for this succession, inspired by the Quranic depiction of Arabs (*'Arab*), Persians (*'Acem*), and Romans (*Rūm*) as the three principle peoples of the world. From this starting point, they constructed a new meta-narrative of civilization that divided history into three primary ages, the first being the age of the Arabs (i.e., Classical Islam), the second being the age of the Persians (i.e., the medieval period), and the third being the age of the Romans (i.e., the Ottomans' own age of dominance). This third "Roman" age, in a manner remarkably evocative of Western humanism, was typically described in terms of "renewal" (*tejdīd*) and was linked to a program of remodeling society based on the standards of ethics, aesthetics, and good governance inherited from Islam's classical age – to which the *Rūmī* intellectuals, thanks to their *madrassa* education and their impeccable knowledge of Arabic and Persian, had privileged access (Andrews 2006; Kafadar 2007).

To this end, the *Rūmīs* were greatly aided by the sweeping Ottoman conquests of Syria, Egypt, and Iraq between 1516 and 1536, victories that provided Ottoman literati with unprecedented opportunities to travel to the ancient centers of Islamic learning and return home with Arabic and Persian manuscripts. By the middle decades of the sixteenth century, hundreds of previously unknown titles had been brought to Istanbul and translated into Turkish for the first time, and through such translations Turkish itself was transformed into a language of high imperial culture that reflected the vocabulary, rhetoric, and poetic inflection of a reputed Islamic golden age (Kuru 2012).

Finally, and perhaps most fascinatingly, as these "Ottoman humanists" embraced the project of remodeling their society based on classical precedents, they did so by developing many of the same genres as their Western counterparts:

biographical dictionaries that glorified the great artists, poets, and scholars of the past and present; histories that placed the Ottoman Empire at the apex of a triumphant story of Islamic expansion, decline, and renewal; reformist tracts that offered cures for the ills of society based on models from an Islamic golden age; and so forth. Eventually, these became the foundations of an entirely reconstituted cannon of literature and history that permanently redefined the contours of Ottoman elite society (Fleischer 1986). Thereafter, it would become almost impossible to imagine that the Ottoman Empire had ever been anything other than an essentially Turcophone and Muslim state, in much the same way that the European Renaissance made it impossible to imagine early modern Europe as anything other than the unique heir to Greco-Roman antiquity.

Impact and Legacy

Perhaps the clearest illustration of the Ottoman Renaissance's long-term legacy is found not in the literary arts but rather in the field of architecture. Over the course of the sixteenth century, the celebrated master architect Mimar Sinan (d. 1588) developed an innovative style of Ottoman mosque based on a cascading series of half-domes surrounding a central vault. The style was explicitly designed to reproduce, in an Islamic guise, the imperial grandeur of the Hagia Sophia, and in a well-known passage from his autobiography, Sinan even boasted of having *surpassed* the splendor of the Hagia Sophia's majestic dome with his buildings, thereby succeeding where contemporary Italian architects had failed (Necipoglu 2005).

The style proved so architecturally powerful that it was reproduced at countless locations and on varying scales throughout the Ottoman Empire. Eventually, it became the most universally recognizable symbol of Ottoman Islam, to the extent that its original association with *Romanitas* and Christianity became almost totally obscure (Kafesçioğlu 2009). As a result, among the most common reactions today of naïve first-time visitors to the Hagia Sophia is to remark that it “looks like a mosque.”

In a similar way, scholars have been just as powerfully influenced by the Ottoman Renaissance, which continues to shape – albeit in ways that are all too rarely acknowledged – our contemporary understandings of Islam, classical antiquity, the Greco-Roman legacy, and the basic contours of Western civilization.

Oughtred, William

Born: 5 March 1575? Eton College

Died: 13 June 1660, Albury, Surrey

William Burns

George Washington University, Washington, DC, USA

Abstract

The Reverend William Oughtred was one of the foremost mathematical writers and instrument-makers in seventeenth-century England. The mathematical library he built at his rectory of Albury in Surrey attracted visitors and pupils from far away and even the Continent. It was particularly important given the limited circulation of Continental mathematical books

in England. He took mathematical pupils at the rectory, and, like many seventeenth-century mathematicians, practiced astrology.

Biography

English mathematician William Oughtred was educated at Eton School and King's College of Cambridge University, although he was largely self-taught in mathematics. He was ordained as a minister in the Church of England in 1603. In 1606, he married Christgift Caryll, who bore him either 12 or 13 children.

Oughtred's most influential textbook was *Clavis Mathematicae* (1631), published in Latin. It was one of the first mathematical books in England to incorporate the X sign for multiplication and also discussed the recently introduced decimal fractions. Oughtred believed symbols were essential to mathematics and employed many, including the X and four dots (::) to indicate ratios. *Clavis Mathematicae* was extremely concise, and the book's small size made it relatively inexpensive. Oughtred played an important role in bringing modern algebra, principally developed by French and Italian mathematicians, to England. Readers and admirers of *Clavis Mathematicae* included the young Isaac Newton, Robert Boyle, Robert Hooke, and John Locke. Edmond Halley contributed a preface to an English translation that appeared in 1694. Oughtred's last major work was *Trigonometrie* (1657). Like *Clavis Mathematicae*, it was extremely short, reflecting Oughtred's condensed style and use of symbols and abbreviations rather than writing out operations.

Much of Oughtred's reputation was based on his invention of mathematical instruments. Oughtred was an inventor of the circular slide rule, or "Circle of Proportion," based on the recently invented logarithmic scale and building on the work of Edmund Gunter. He was one of the earliest mathematicians to be aware of John Napier's work on logarithms. Oughtred described the slide rule in *The Circles of Proportion and the Horizontal Instrument* (1632). Historians have dated Oughtred's invention of the circular slide rule to 1622, long before he described it in print.

Oughtred also developed a linear slide rule with two moving rods, essentially two of the logarithmic rods devised by Gunter put together. He described the device in *An Addition unto the Use of the Instrument called the Circles of Proportion* (1633). Another instrument Oughtred invented was the planisphere, described in *The Solution of All Sphaerical Triangles by the Planisphere* (1651) although Oughtred had devised it about 40 years earlier. The planisphere was a device for measuring triangles on the surface of a sphere, saving the labor of trigonometric calculations.

Despite Oughtred's own creativity in devising new mathematical instruments, he was suspicious of the role of instruments in mathematical instruction. He argued that there was too much emphasis placed on using instruments as opposed to understanding mathematics. Oughtred believed that students should know the abstract and theoretical part of mathematics before engaging with mathematical instruments, when others, particularly among the professional mathematics teaching community of London, believed instruments should be introduced early in mathematical instruction. Oughtred believed that instruments

should only be introduced once the student understood their theoretical basis.

Oughtred took a royalist stance during the English Civil War, but received enough protection from patrons to keep his clerical position. A legend spread after Oughtred's death was that it had been caused by excessive joy in celebration of the Restoration of Charles II, although several days intervened between when Oughtred would have learned of the Restoration and the day of his death.

P

Pacioli, Luca

Born: October 1446–October 1448, Borgo San Sepolcro (Sansepolcro)

Died: April–July 1517?

Elio Nenci

University of Milan, Milan, Italy

Abstract

Brother Luca Pacioli was one of the leading mathematicians of his day. Drawing upon the works of Fibonacci, Giovanni Sacrobosco, Giordano Nemorario, and Prosdócimo de' Beldomandi, he composed a *Summa* of the mathematical knowledge acquired in the West since the thirteenth century. In the field of arithmetic and algebra, his work often served as a starting point for the more advanced research conducted by later mathematicians. Also noteworthy are his relations with Piero della Francesca and Leonardo da Vinci.

Biography

Pacioli was born into a family long settled in Borgo San Sepolcro and chiefly engaged in farming and animal husbandry. Orphaned at a young age, he was probably entrusted to the care of a wealthy family from his home town: the Bifolci (Ulivi 2009). Nothing is known about his

education, which must have begun in Borgo San Sepolcro and which then continued in Venice, where Pacioli entered into the service of merchant Antonio Rompiasi. In the lagoon city, Pacioli took mathematics lessons from Domenico Bragadin, while in turn tutoring Rompiasi's three sons, to whom in 1470 he dedicated an arithmetic and algebra volume that is now lost (Pacioli 1494).

For a short time between 1470 and 1471, Pacioli was Leon Battista Alberti's guest in Rome (Pacioli 1509a). He must have moved back to his home town shortly afterwards, as he is mentioned there as the witness to some notary deeds drawn up between February 1471 and 1473. These documents refer to him for the first time as Brother Luca (Ulivi 2009). Entry into the Order of St Francis did not lead Pacioli to quit his mathematical studies, and between 1477 and 1480 he taught mathematics at Perugia University. This teaching probably lies at the basis of his *Tractatus mathematicus ad discipulos perusinos*, preserved by mss Vaticano 3129 (Pacioli 1996).

In 1481, Pacioli travelled to Zara, where he composed a new arithmetic and algebra volume, also lost (Pacioli 1494). In this period, he applied himself to the study of theology, earning the title of *magister sacrae paginae* (Ulivi 2009). After spending some time in Florence, in 1487–1488 Pacioli was once more invited to teach at Perugia; then the following year he moved to the University of Rome (Pacioli 1494). In subsequent years, Pacioli often stayed at the Franciscan monastery in his home town, but in 1494 he was in Venice,

where he closely collaborated with the publisher of his most important work: the *Summa de arithmetica geometria proportioni et proportionalità* (Pacioli 1494). This became a reference text for practically all sixteenth-century mathematicians working on algebra, including Niccolò Tartaglia and Girolamo Cardano, who took it as their starting point in the search for a general formula to solve third-degree equations.

Between 1496 and 1499, Pacioli was at Ludovico Maria Sforza's court in Milan. Here he established a close friendship with Leonardo da Vinci, who drew the many figures of solid bodies featured in a collection of Pacioli's works bearing the general title of *Divina proportione* (Pacioli 1509a). Published in 1509, this collection also included the *Libellus in tres partiales tractatus divisus quinque corporum regularium dependentium*, which directly drew upon a text by Pacioli's illustrious fellow citizen Piero della Francesca. This is only one of the many "borrowings" from the great painter's œuvre to be found in the works of Pacioli, who was therefore openly charged with plagiarism by Giorgio Vasari in his life of Piero della Francesca (Vasari 1550).

Having fled Milan together with Leonardo after Ludovico's fall, Pacioli moved to Florence, where he taught until 1505. In 1508, he was back in Venice, where he gave a lecture on Book 5 of Euclid's *Elements* (Pacioli 1509b). Here, again in 1508, Pacioli requested a privilege in order to publish some of his works. These included the *Divina proportione* and Euclid's *Elements*, which were personally edited by him and went to press the following year (Boncompagni 1879). By contrast, his *De viribus quantitatis*, preserved in codex 250 of the Bologna University Library (Pacioli 2009), and *De ludo scachorum*, recently rediscovered in the library of the Palazzo Coronini Cronberg Foundation in Gorizia (Pacioli 2007), remained unpublished.

Between 1508 and 1511, Pacioli drew up no fewer than three wills (Ulivi 2009). Meanwhile, he continued to teach, albeit less frequently, returning to Perugia in 1510 and to Rome in 1514. Perhaps in the latter city, or perhaps in his home town Borgo San Sepolcro, Pacioli breathed his last in 1517.

Abstract

Aonio Paleario is known as an exponent of the Italian reformation movement of the sixteenth century. His major work is the *Actio in Romanos pontifices*, published about 30 years after his death in 1600. He was born in Veroli, in central-southern Italy, and during his entire life was in contact with major Italian intellectuals; his philosophical poem *De animorum immortalitate* put him at the core of the sixteenth-century discussion on the immortality of the soul. Admired by his contemporaries for the elegance of his Latin, Paleario got close to concepts and ideas of the evangelical movement: Martin Luther, Zwingli, and the Conciliarist movement. He was accused of heresy for the first time in 1542 but was released from the charge; thereafter, in 1567, he was again charged with heresy and was arrested in Milan. He refused to deny his faith and was executed in Rome in 1570.

Alternate Names

della Pagliara, Antonio; Paleari, Antonio

Life and Works

From Veroli to Padua

Antonio della Pagliara, son of Matteo della Pagliara and Clara Jannarilli, was born in Veroli (now in the province of Frosinone, south of

Rome), in 1503 or 1504. The Latin version of his name, “Aonio Paleario,” was adopted by the author following the humanistic fashion. His father was a craftsman, but Aonio’s mother came from a wealthy family, and her patrimony allowed their son to have a proper humanistic education, first in Veroli – by a local notary – then in Rome, where he remained for 9 years, from 1520 to 1529. Several documents concerning the Pagliara family and their property are still preserved in the local archive of Veroli (D’Onorio and Gabriele 2008). We have little information about his Roman stay, but it is known that starting from 1525, he attended classes by Ludovico Boccadiferro, who was engaged in a dispute over the immortality of the soul, arguing against the position expressed by Pietro Pomponazzi (1462–1525). Later, Paleario shall stress this topic, by composing a poem on the immortality of the soul. In Rome, he met Bernardino Maffei, who would assist him when he was charged with heresy for the first time. After a short stay in Perugia, Paleario went to Siena, where he got in touch with important families, such as the Spannocchi, Tolomei, and Bellanti. Aonio became a tutor to Antonio Bellanti’s children, and when their father was prosecuted, Paleario composed an oration, *Pro Bellante* (1533), through which he became known in the cultural circles of Siena.

Although based in Siena, Paleario continued to travel throughout Italy. From 1532 to 1536, he was in Padua (returning for a while to Siena for Bellanti’s trial), a city where he met Pietro Bembo (1470–1547) and Benedetto Lampridio (1478–1540) and started his itinerary through the ideals of the reformation. Paleario dedicated himself to the learning of Erasmus, Luther, and Melancton. He wrote a letter addressed to Erasmus on 5 December 1534, which showed how deeply he admired Erasmus’ work, especially his *Declarationes ad censuras Lutetiae vulgatas sub nomine facultatis Parisiensis*; Paleario hoped for a general council summons after the election of Alessandro Farnese as Pope Paolo III (1534), which would spark a genuine reformation of the whole Church (Caponetto 1979, 211–214). In the following years, Paleario intensified his relationships with Venetian intellectuals: Marcantonio

Flaminio (1498–1550), Alvisi Priuli (early 16thc. –1560), and in a roundabout way, Cardinal Reginald Pole (1500–1558). During this period, Paleario composed his three-book poem, *De animorum immortalitate*, which was published for the first time in 1535 without any indication of the printer and, later, in 1552, in Lyon, thanks to the support of Iacopo Sadoletto (1477–1547), Bishop of Carpentras (Paleario 1552, 1992). The most relevant characteristic of this work is its deeply anti-Lucretian, antimaterialistic attitude: Paleario stands in sharp contrast to the idea that the immortality of the soul cannot be harmonized with Aristotelian philosophy, as Pomponazzi did in his *De immortalitate animae* (1516). Echoes of Lutheran and Erasmian lectures are easily recognizable too (Gallina 1989, II, 96–121).

From 1537 to 1567

Back in Siena, Paleario married Marietta Guidotti in 1537. In the following years, he grew closer to the Florentine environment, where he was already known for the excellence of his Latin. His life fluctuated between Siena and Florence, and his activity in the sense of the reformation was increasing. In 1542, indeed, while Paleario was in Rome, charged with heresy, he was able to defend himself thanks to the intervention of his old friends, Bernardino Maffei, Pietro Bembo, Reginald Pole, and Iacopo Sadoletto. After this, Paleario wrote the oration *Pro se ipso* (1543 or 1544), in which he recalls his experience, stressing the ideas of freedom of thought and religion. In the text, Paleario mentioned the summons of Bernardino Ochino to Rome and the attack on Sadoletto's works, as examples of the abuse of power by the Roman Church. With this suspicious mood, Paleario still had hopes for the general council call, and as he did in 1534 with Erasmus, he wrote a letter to Luther, outlining his wishes. His opinions on the reformation impeded his career in the Studium of Siena, and in 1546, he decided to accept a job as a teacher in Lucca, where he remained until 1555. In Lucca, he wrote the *Dialogo intitolato il grammatico, ovvero delle false essercitationi delle scuole* (Venezia, F. Franceschini 1567, Paleario 1726) and several orations. Once back in Siena, Paleario composed a

vernacular work entitled *Dell'economia o vero governo della casa*, where he engaged with several female issues, especially education and marriage.

Milan and the Second Trial

Without a stable occupation, Paleario continued to seek jobs and protection. He was called to Milan to teach humanities, but these Milanese years are most significant for his relationships with Celio Secondo Curione (1503–1569), Theodor Zwinger, and several printers from Basel. Paleario was charged with heresy for a second time during his Milanese sojourn, in 1559, but the accusation was again dropped. He realized, though, that he was in danger and the increasing repression of the ecclesiastical authority, especially after the end of the Council of Trent (1545–1563), pushed him to hide his last work, the *Actio in Romanos pontifices*. Paleario gave custody of his work to Zwinger who kept it for the rest of his life. The *Actio* was published for the first time only 30 years after Paleario's death, in 1600. Paleario's fear had solid grounds. In 1567, he was arrested and forced to go to Rome. He refused to defend himself or to deny his religious and personal beliefs. For these reasons, he was executed in Rome on 3 July 1570 (Quaranta 2014).

Paleario and the Tuscan Reformation Movement

With the end of the second Savonarolian republic in 1530, Florence came back under the government of the Medici party and the hopes of an approaching reform required another form of expression. The Lutheran movement and the reformation movement found fertile ground in the city of Florence, as testified by works such as *Storia in dialogo della mutazione di Firenze* by Bartolomeo Cerretani (1475–1524). Moreover, Valdesianism started to grow: this was a religious tendency inspired by the theologian and reformer Juan de Valdès (1505–1541), who stressed the importance of the Gospel in Christian life. From 1533, Valdès was in Naples, where he raised a circle of intellectual reformers, among whom was

Bernardino Ochino, who took part in the diffusion of Valdesianism in Tuscany in Paleario's time. Among the works blooming in Naples, we can mention the famous *Trattato del Beneficio di Cristo* by fra Benedetto da Mantova, attributed at an early stage to Paleario. The *Beneficio* was published anonymously and on the title page was written "you should care more about the content, than the importance of the author" ("più la cosa vi muova che l'autorità dell'autore"). Florentine intellectuals, although reassured by the patronage of Cosimo I, continued to consider their Savonarolian heritage. It would be an exaggeration to assert that every academic in Florence had a Lutheran attitude, but we can say with no doubt that many of them were looking for religious and intimate freedom, as a possible counterbalance to their lost political freedom. It is important to point out that Paleario was not a follower of Valdesianism, even if he was close to many Valdesians. He shared with them a firm belief in the basic importance of the Gospel but was convinced that the intervention of the imperial authority was necessary to realize a true reformation of the Church, as he stated in the *Actio*. During his Florentine years (from 1538 to 1546), Aonio established several friendships and cooperative relationships. In Florence, he was preceded by his reputation as a great Latin poet, so that the members of the cultural circles linked to Cosimo I admired him. More important was his friendship with Pier Vettori (1499–1585) – interpreter of Aristotle and author of a famous commentary on *Ethics* – Francesco Verino il Vecchio, and Bartolomeo Panciatichi (1507–1582), a wealthy Florentine merchant, with cultural and religious interests, who publicly declared his Calvinistic faith (Caponetto 1979).

The "querelle des femmes" and the Governo della casa

An interesting vernacular work by Aonio Paleario is the dialogue *Dell'economia overo del governo della casa* (Paleario 1983). It was finished in 1555 in Colle Valdelsa and is the second part of a bigger work, the first part of

which was *Del governo delle città*. Paleario wanted to dedicate this two-part work to men and women: the government of the cities for men and the government of the house for women. Unfortunately, the first part was lost during the conflicts in which the city of Siena was involved at that time. The dialogue takes place in 1531, in the fortress of Aiole, where many women discuss the domestic environment, without the presence of men. The topics raised in the *Del governo della casa* are keen and unusual, mostly because Paleario focused on the specific role of the wife in the marriage and the education of young women. We can recall here the figure of Cassandra Spannocchi, wife of the aforementioned Antonio Bellanti, and Porzia Petrucci, the Erasmian character of the dialogue. Porzia talks about her cultural interests and also leads a severe critique of masculine behavior: selfish, ruthless men do not feel affection, they just act in order to achieve money and power. Paleario demonstrated through this work a remarkable modernity, especially stressing the subordinate role that the Church reserved for women by preventing them from gaining a proper education. In any case, several preceding authors dealt with the feminine issue: Francesco Barbaro in the *De re uxoria*, Leon Battista Alberti in the *Libri di famiglia*, and Agrippa of Nettesheim in the *De nobilitate et praecellentia foeminei sexu*, a text printed in Venice in 1545.

The *Actio in Romanos pontifices*

The *Actio in Romanos pontifices* is the most important work by Aonio Paleario, at least with regard to the history of the reformation in Italy. The title and intention of the author recalls Cicero's *Actio in Verrem*. The text is divided into 20 chapters or theses, through which Paleario aims to demonstrate that the Roman Popes are responsible for the corruption of the Catholic Church. He started to work on the *Actio* in 1536 and decided to give custody of it to Theodor Zwinger, well aware of the danger and the risk he was running. This is what the preface to the first Latin edition states (Paleario 1600), where we can

read that the work was discovered in 1596, almost 30 years after Paleario's death. He also begged his friend to deliver – somehow – his work and his message to Emperor Charles V, convinced that the emperor and the German princes should be involved in the reformation process. The preface to the 1861 edition (Paleario 1861), provides interesting evidence of the durability of Paleario's image throughout the centuries. Aonio is placed in an imaginary line of continuity with other enemies of the corruption of the Catholic Church, such as Dante, Machiavelli, and Campanella. Then, the editor mentions several authors who stressed the importance of the Gospel in Christians' lives: Pietro Carnesecchi, Pietro Martire Vermigli, Celio Secondo Curione, and Girolamo Savonarola.

The *corpus* of Paleario's works was edited in 1626 and 1728 (Paleario 1728).

Palingenio Stellato, Marcello

Born: Second half of 15th century, date unknown, Southern Italy

Died: Between 1537 and 1551, date unknown, probably Forlì, Cesena or Verucchio

Anna Gabriella Chisena

Dipartimento di Lettere e Filosofia, University of Florence, Florence, Italy

Abstract

Marcello Palingenio Stellato is an Italian author known for writing the poem *Zodiacus Vitae*, printed in Venice by Bernardino dei Vitali. Despite the enormous diffusion of the work between the sixteenth and nineteenth centuries (counting 59 editions), there is very little biographical information in our possession on the author.

Alternate Names

Manzolini, Pier Angelo; Manzoli, Pier Angelo

Biography

Very little is known about Marcello Palingenio Stellato, the author of the *Zodiacus Vitae*, the didactic poem in Latin whose *editio princeps* was printed in Venice in 1536. His date and place of birth are unknown. It is not even sure if the name of the author is his actual name at birth or simply a pseudonym. In 1725, the Italian scholar Facciolati extended the idea – which is still widely accepted in modern scholarship – that the enigmatic name is an anagram of Pier Angelo Manzolini, who was native to Stellata (Facciolati 1765). At the basis of Facciolati's assertion rests the hypothesis, which circulated within Protestant circles and was accepted by his German correspondents Fabricius and Heumann, that Marcello Palingenio was actually a fictitious name. In particular, the *nomen Palingenius*, that is, “Renatus,” was interpreted as a sign on Stellatus' part to please Renée of France. She was the wife of Hercules II d'Este, the dedicatee of the *Zodiacus Vitae*. After having hosted Calvin in Ferrara in 1535, the Duchess became a fervent Calvinist. The *cognomen Stellatus* was interpreted as an adjective derived from the name of a small village near Ferrara, Stellata, which was believed to be the author's city of origin. The proximity to Ferrarese culture, therefore, was ascertained from the dedication to Hercules II d'Este and the revealing, in the epistle premises at the poem, of a certain familiarity with Antonio M. Brasavola, archiater of the Duke.

Facciolati's conjecture, devoid of any true confirmation, was recently confuted by Bacchelli. Starting from the permission for the first Venetian print of the *Zodiacus*, obtained in 1535, in which Palingenius is clearly indicated as “Neapolitanus,” the scholar was able to establish that the poet's origins rest in the Campania region of Italy (he was probably born near Capua). More importantly, he was able to show that the poet's name is not a pseudonym. The name Marcello

Stellato, in fact, already appeared – with the addition of the *nomen Palingenius* in reference to spiritual qualities – in two prints edited between 1522 and 1524 in Rome and Naples (Bacchelli 1985, 2008).

The stylistic and rhetorical devices found within the *Zodiacus*, with the evident fifteenth-century characteristics, suggest that Palingenio was formally educated in the south of Italy at the end of the fifteenth century. The extreme scarcity of information regarding Palingenio is due to the marginality and relative isolation in which the author lived, working as a teacher of *grammatica* or perhaps as a doctor, the latter being the more unlikely of the two professions (Palumbo 2007). Following the confirmation of his probable presence in Rome in 1522 and in Naples in 1524, the poem itself provides other biographical information. In *Sagittarius* 996–1017, the poet's stay in cities in the Romagna region is mentioned. His time in Verucchio, during the meeting between Clement VII and Carlo V in Bologna (1530), particularly stands out. During his stay in Venice to obtain printing permission (1534–1535), Palingenio had already started the application procedure for becoming *magistrum humanarum litterarum* in the city of Forlì (Bacchelli 1999, 2008). From the acts of the City Council, we learn that the last payment for his services is from 26 October 1537.

It was in the Romagna region, probably in Forlì, Cesena or Verrucchio, that Palingenio died. While the precise date of death is unknown, widely known is the information passed down by the contemporary Lilio Gregorio Giraldi in his *De poetis suorum temporum dialogi duo* (Ferrariensis Gyraldi 1551). Therein, the posthumous exhumation and burning of Stellato's bones “ob impietatis crimen” is recounted. The accusation of heresy and the successive fury towards the corpse were confirmed by other sources. In the Cod. Vat. Lat. 6207, containing documents relative to the congregation of the *Index Librorum*, at f. 232v, we find a report, probably dating to 1558, that Palingenio “nihil credens neque divinitatem Christi Cesenae perfidus mortuus est” (Bacchelli 1990). A letter from the same year, addressed to the General of the Campaign Laynez from the

Jesuit Francesco Palmio, more precisely recounts that the body of Palingenius, a teacher in Forlì, was posthumously disinterred and burned due to “certi libri heretici che lui havea composti” (Borgiani 1912).

Impact and Legacy

The only known work of Palingenio remains the *Zodiacus Vitae*, a didactic poem divided into 12 books, each one entitled with a different zodiac sign. The first edition of the poem, published in Venice by Bernardino dei Vitali, is undated. As the permission to print is from February 1535 and the first edition outside of Italy is from September 1537, it was probably released in 1536. While the poem went virtually unnoticed in Italy, it enjoyed considerable success abroad: there are, from 1537 to 1599, 31 editions, 2 integral translations (English and German), and a paraphrased version in Polish.

After the *damnatio* of the author came, in Catholic circles, that of the work: it was added to the *Index Librorum Prohibitorum* by Pope Paul IV (1559). The bitter polemics with the clergy and the Roman Church present in the *Zodiacus* determined the success of the work in Protestant settings. However, despite the overwhelming distrust of all of the religious orders, the poem does not directly treat issues particular to the Protestant Reformation. Luther himself is mentioned only once, in the *Capricornus* 821–827.

The distance between the ideas contained within the *Zodiacus* and Christian doctrines is manifest. In the work, in which Ficino’s Neoplatonism, ideas from radical Aristotelianism, and theories on the relationship between religion and politics all intertwine, Palingenio strongly supports the spatial infinity of the universe, God, and the cosmos (Moreschini 2013, p. 103). According to the author, the celestial spheres are inserted into an infinite space of light where God, angels, and infinite archetypes dwell. The divine luminosity, which contains the ideas, penetrates through the last sphere, illuminating the skies and giving origin to the beings that populate the seven planets. Next, the archetypes – perfect exemplars

of all things – are fully realized in the “vera” planetaria they embody. The greater the distance of separation between the divine source, the more the luminosity that sustains the planetary essences becomes weak and imperfect. Collocated at the maximum degree of distance from God and the archetypes, the Earth, the darkest part of the universe, becomes a true hell in which imperfection and evil live. Combining Neo-Platonic and Lucretian suggestions, therefore, Palingenio’s cosmos is characterized by a marked dualism in which the perfection and eternity of the heavens are put into direct opposition with the corruption and temporality of the sublunary sphere (Koyrè 1957; Garin 1976, p. 121). For Palingenio, the border that separates the two worlds, the “medium mundi,” is established by the Moon, the last true world in which the court of the souls is based (*Sagittarius*, vv. 150–163).

Also of probable Lucretian influence is the idea that the cosmos are strictly defined and not created for man. In his discussion, in the book of *Leo*, of the fundamental problem “An mundus sit hominis causa factum,” the author strongly underlines that the universe originates from the necessity and desire of God, who generated things alone and solely “propter se ipsum id est ad sui laudem et gloriam” (*Leo*, vv. 169–220). Rigidly determining the functioning of the universe, the divine will establish the mechanisms that regulate it according to modalities that man cannot understand. In such an organism, therefore, every human pretense to be at the center of the universe disappears and every moral distinction between good and evil is annulled as our actions fall within the project that God designed for himself within the great theatre of the cosmos. Thanks to a new reading in a Christian light the suggestions from the coeval analysis of Luther (*De servo arbitrio*) and Pomponazzi (*De fato*), Palingenio comes to negate every pretext regarding the freedom of human will.

In the verses of *Zodiacus vitae*, Palingenio – the first in all of Italian Renaissance – presents the description of a cosmos penetrated and traversed by a universal “spiritus,” in which Pantheism and Pan-determinism coincide. God is infinitely needed by himself, and in him,

will and wisdom perfectly coincide with power. As these three expressions of divinity are themselves infinite, Palingenio arrives by deduction at admitting that the universe must be eternal and infinite in size. Palingenio's treatise on the infinity of the cosmos was appreciated and re-examined a few years later by Giordano Bruno, who discussed some verses of the *Zodiacus vitae* in his *De immenso*.

Palmieri, Matteo

Born: 13 January 1406, Florence

Died: 13 April 1475, Florence

David Marsh

Rutgers School of Arts and Sciences, Rutgers University, New Brunswick, NJ, USA

Abstract

The Florentine apothecary Matteo Palmieri (1406–1475) benefited from a humanistic education, which inspired him to compose several works of learning. In Latin, he wrote three historical tracts – a chronicle of his times, an account of the 1406 subjugation of Pisa, and a biography of Niccolò Acciaiuoli – and in Italian two philosophical works with chiasitic titles, the Ciceronian dialogue *Della vita civile* and the cosmological poem *Città di vita*. As a philosopher, Palmieri is scarcely original. His dialogue presents eminent Florentines expounding ethical doctrines that are largely derived from Cicero, while his poem in *terza rima* portrays Dante and the Cumaean Sibyl as they observe the fate of human souls after death. All the same, Palmieri is important as a lay representative of that strain of Florentine humanism that embraced both the classical heritage and the vernacular tradition of Tuscan poetry and piety.

Introduction and Biographical Section

Matteo Palmieri, who trained as an apothecary, belonged to the *Arte dei Medici e Speziali*, and like his father Marco, he served in various public offices (Martines 1963, pp. 191–198). He also received a humanistic education, studying with Marsuppini and Filelfo. In Latin, he composed a chronicle *De temporibus*, an account of the 1406 defeat of Pisa called *De captivitate Pisarum* (Palmieri 1995), and a biography of Niccolò Acciaiuoli (1310–1365; Palmieri 2001). In Italian, he composed the dialogue *Della vita civile* (1433–1436; Palmieri 1982) and a poem in Dantean tercets, *Città di vita* (1455–1464; Palmieri 1927–1928), which was condemned by the church. Like Giannozzo Manetti, he served as an ambassador for Florence, promoted the learned use of Italian, and was included in the series of lives composed by Vespasiano da Bisticci. There is a portrait bust of him by Antonio Rossellino in the Museo Nazionale del Bargello, Florence.

Heritage and Rupture with the Tradition

Palmieri's most important philosophical work is his dialogue *Della vita civile* (Mita Ferraro 2005; Palmieri 1997; Tanturli 1996). Dedicated to the Florentine magistrate Alessandro degli Alessandri (1391–1460), the work consists of four books that discuss the principles of the good life. Its subject and format resemble those of the contemporary *Della Famiglia* of Leon Battista Alberti, and Palmieri's spokesman Agnolo Pandolfini also appears in Alberti's Italian dialogue *Profugia ab erumna* (Mita Ferraro 2005, pp. 298–299). In several passages of the work, Palmieri writes that his purpose is to offer his readers "the precepts of the ancient philosophers." His central model is Cicero, who had similarly expounded Greek philosophy to Roman readers, and he draws heavily on the Roman orator, especially the *De inventione*, *De officiis*, and *Tusculan Disputations*. While adopting concepts from Aristotle's *Nicomachean Ethics*, which had

recently been translated into Latin by Leonardo Bruni (1417), Palmieri also draws upon the Latin authors Aulus Gellius, Sallust, Valerius Maximus, and Macrobius and the poets Plautus, Terence, and Virgil. Book 1 treats the education of children; Book 2, the three cardinal virtues of prudence, moderation, and fortitude; Book 3, the fourth virtue, justice; and Book 4, the contrast between what is useful and what is honorable. The work ends with a *Somnium Dantis*, in imitation of the conclusions of the *Republics* of Plato and Cicero: in it, the poet Dante beholds a vision of souls after death, including noble pagans. Following Origen's theory of the preexistence of souls, Palmieri asserts that human souls descend to the earth from heaven and after three incarnations end in either salvation or damnation. In between these incarnations, the souls travel through the spheres of heaven and wait in the Elysian Fields.

Innovative and Original Aspects

While Palmieri is essentially a compiler, there is an element of innovation in his ethical thought. Whereas in Books 2 and 3 of *Della vita civile* he expounds the traditional categories of the cardinal virtues, in Book 4 he departs from Cicero's *De officiis*. Noting that he writes for a popular audience, Palmieri rejects the notion that utility (*l'utile*) and honorability (*l'onesto*) necessarily coincide (Palmieri 1982, p. 151). Instead, he outlines and sanctions various categories of what is useful, including Renaissance values such as magnificence (Mita Ferraro 2005, pp. 294–295).

Palmieri makes another contribution to Renaissance philosophy in his poem *City of Life* (*Città di vita*). Like Dante's *Comedy*, the work consists of 100 cantos in tercets that narrate the poet's tour of the afterlife in the company of the Cumaean Sibyl, who acts as the poem's Virgilian guide. (The work was supposedly inspired by dreams that appeared to Palmieri during embassies to Pescia and Naples in the 1450s.) The three parts of the poem offer a cosmological account of the universe, a

description of hell, and a vision of heaven. Palmieri's scheme of the heavens follows the Ptolemaic spheres described in Dante's *Purgatorio*, but in reverse order, that is, descending from the empyrean to earth. The description of hell in Book 2 offers reflections on the seven deadly sins. The vision of heaven in Book 3 surveys the cardinal virtues treated earlier in *Della vita civile*, establishing a system of rewards for these virtues viewed in two aspects: civic and purgatorial. A few characters featured in Dante reappear, but in general, the work reads like a rather colorless cento of the *Comedy*. One new character is Hermes Trismegistus, who appears in heaven as a prophet (3.26).

Even though the author had his poem corrected by Leonardo Dati, the bishop of Massa Marittima, suggestions of Pythagorean metempsychosis and Origen's preexistence of souls evidently caused Palmieri's readers some discomfort. Indeed, rumors circulated posthumously that the poet had been condemned and even burned by the church (Mita Ferraro 2005, pp. 419–432).

The source of the suspicion is found in Canto 5 of Palmieri's Book 1, which narrates the lot of God's original angels. After Satan's rebellion, his partisans were forever condemned to hell, while his opponents remained in heaven (Freccero 1958). The neutral angels remained between heaven and hell to furnish souls for human beings, who would later be assigned redemption or damnation (*City of Life* 1.5.34–53, a passage echoing Dante's *Inferno* 34–42.)

Impact and Legacy

In the Quattrocento, Palmieri's *Della vita civile* enjoyed a certain popularity: some eighteen manuscripts survive. The first printed editions date from 1529 (Florence: Eredi di Filippo Giunti and an anonymous publication), while the next four editions date from the nineteenth century. Vespasiano di Bisticci considered Palmieri important enough to include him in his *Lives*, but the rumors of his heresy led to a *damnatio*

memoriae that lasted several centuries (Mita Ferraro 2005, pp. 299–304). In the nineteenth century, Georg Voigt could write that Palmieri's writings were never known in wider circles (Voigt 1893, 1:291).

Republic

Abstract

The term “panpsychism” is derived from Francesco Patrizi’s neologism “pampsychia” created from the Greek words “pan,” that is, “all,” and “psyche,” which is “soul.” Patrizi describes, by means of this term, the central part of his work *Nova de universis philosophia* (1591). The panpsychic doctrine on the mind as the fundamental quality of all things in the universe has its origin, however, back in the pre-socratics and was developed first in ancient and then in Renaissance philosophies. Renaissance panpsychic doctrines are usually formulated in opposition to Aristotelianism and are connected with the Platonic concept of the world soul animating the world; the stoic notion of *pneuma*, the spirit penetrating the universe; and the Empedoclean two animate and opposing forces of the world – attraction and repulsion. Although certain signs of panpsychism can be found in Marsilio Ficino’s thought, only Girolamo Cardano and Bernardino Telesio elaborated on a genuine panpsychic philosophy. While Cardano follows the theories of the world soul and the hot spirit, Telesio considers all things in the world to be sentient, and, therefore, his doctrine can be called pansensism. Panpsychism was held in three different forms at the end of the sixteenth century. Francesco Patrizi develops the Neoplatonic doctrine of the hierarchical universe where the soul occupies the central position. Giordano Bruno uses panpsychism in his cosmological ideas, and Tommaso Campanella follows both Telesio’s pansensualism and the platonic doctrine of the world soul and incorporates panpsychism into his metaphysics and epistemology.

Synonyms

Pampsychism; Pansensism

Heritage and Rupture with the Tradition

Elements of panpsychism can already be found in the works of early Greek philosophers (Skrbina 2005). Beginning with Thales’ sentences quoted by Aristotle, “all things are full of gods” (*De anima*, 411a19) and “the lodestone has a soul because it moves iron” (*De anima*, 411a19), certain panpsychic thoughts emerge in a number of pre-socratics, such as Empedocles, who states that “the soul is composed of all the elements and that each of them actually is a soul,” as Aristotle refers (*De anima*, 404b11). Allusions to early panpsychism appear in Plato in his theory of the world soul (*Philebos*, 30a) and the concept of the cosmos as a living thing (*Timaios*, 31a). The panpsychic reading of Plato was underlined by Plotinos. According to him, “Plato says there is soul in everything of this [earthly] sphere” (*Ennead* VI, 7, 11). The stoic doctrine of *pneuma* is another source of Renaissance and early modern panpsychism. *Pneuma* (the spirit) as creative fire penetrates the entire cosmos and animates the world. Thus, Diogenes Laertius refers to the stoic cosmos as “. . . mind penetrates every part of it just as soul does us,” (*Vitae philosophorum*, II, 7, 138), and Cicero asserts that “the parts of the cosmos contain the power of sense-perception and reason” (*De natura deorum*, II, 39). Although certain panpsychic thoughts are even incorporated in Aristotle’s philosophy stating that “all things are full of soul” (*De gen. anim.* 762a18), Aristotelian hylemorphism was viewed in the Renaissance as a philosophy attributing the soul to only a limited amount of substances. Thus, Renaissance philosophers holding certain panpsychic positions formulate their doctrines in opposition to Aristotelianism and follow Platonic, pre-socratic (Empedoclean), or stoic philosophies or combine these traditions.

Innovative and Original Aspects

Girolamo Cardano is often considered the first Renaissance philosopher elaborating panpsychism (Skrbina 2005, 2009). In the *De subtilitate*, Cardano distinguishes five principles of reality: matter, form, motion, place, and soul. He refuses to identify soul with form because then it would not be an independent principle (Cardano 2013, p. 124). Later on in the *De uno*, he accepts the concept of the world soul for it enables him to consider the world as a unity. In the *De natura*, where his anti-aristotelianism is more explicit (Fierz 1983), Cardano criticizes the Aristotelian theory of elements by means of the concept of the world soul which is close to the stoic identification of pneuma with fire. Soul and body are the fundamental principles, and heat and humidity are the functional instruments of the soul (Cardano 1663, p. 285). Cardano then describes nature as “an impression of soul into the body” and considers nature primarily as soul for in nature everything “is dependent on the soul” (Cardano 1663, p. 286).

Cardano borrowed the concept of the world soul from Marsilio Ficino, who identified it with the third of Plotinus’ hypostasis (Allen 1987). Although the concept of the world soul does not simply imply panpsychism, Ficino’s philosophy could be viewed as a starting point for later panpsychic doctrines. Ficino determines the relationship between the world soul and the world as between our soul and body in the platonic theology. This means that the world soul is “present in its entirety in any given part of the world” (Ficino 2001, p. 286). Although Ficino speaks here of the universal soul and universal body, at another point he ascribes the soul to the elements of water and air (Ficino 2001, p. 248). Ficino’s world soul is not present in things as such but creates forms in matter by means of seeds, which are impressed into matter. The world soul has a mediating role. It corresponds upward with ideas in the intellect and downward with seeds of reason in matter. In the *Three Books on Life*, the concept of the world soul enables Ficino to consider the entire

world as animated through the spirit, which is a subtle substance responsible for generation in the world (Ficino 1989, p. 254).

Ficino’s speculation on the world soul had an influence on a number of Renaissance astrologers and Paracelsians. Paracelsus himself works with both the concept of the world soul and the seeds. His three principles (sulfur, salt, and mercury) have a spiritual character and are connected with seeds. Paracelsus finds seeds in matter carrying intelligence (Pagel 1982). Heinrich Cornelius Agrippa of Nettesheim also borrowed the concept of the world soul and coined the concept of the world spirit, by means of which the upper intelligences infused their occult qualities into stones, plants, and animals (Agrippa von Nettesheim 1992, I. 14).

Ficino also influenced Girolamo Cardano and had a partial influence on Bernardino Telesio as well. With respect to panpsychism, however, Telesio follows Empedoclean principles of heat and cold, which he views as active and adds a passive principle matter. Opposite principles have to sense themselves and each other in order to know what is contradicting their conservation and what is not. Since everything is composed of these principles, everything must therefore be sentient (Telesio 2013). It would consequently be better to call Telesio’s concept “pansensism.” Telesio does not need the mediating role of the soul as a bridge between the intellectual and the extensional, for everything is both sentient and extended (Walker 2000). Telesio works with the concept of the soul, which he views as infused by God and as only proper for man. The spirit, in contrast, which is produced from the seed and is a kind of subtle body, has sensation as awareness of changes caused by external things and of the passions that these changes affect (Kristeller 1964).

The author of the term “panpsychism,” or precisely “panpsychia,” was probably Francesco Patrizi, who divided his book *Nova de universis philosophia* into four sections: Panaugia, Panarchia, Panpsychia, and Pancosmia. Panpsychia as a doctrine on the all-soul plays a central role connecting the world of ideas Panarchia and the corporeal world Pancosmia. Patrizi speaks about the soul (animus) as a central

hypostasis in the Neoplatonic hierarchy and distinguishes between animus and anima, while the former is ascribed to all things except man and the latter only to man. The soul (animus) placed into the hierarchy of being cannot exist without the universality of the higher grade (Blum 2014). It is therefore both one, universal, and incorporeal and many and corporeal; thus, it is incorporeal-corporeal (Brickman 1941). Patrizi criticizes Aristotle for the selective distribution of the soul and argues that there is no reason to deny the soul to the entire world and the elements. He develops an argument against emergence: nothing can give what it does not have. How could the world give the soul, if it does not have it (Patrizi 1591, *Pampsychia* 4, fol. 56ra)? Patrizi even denies the existence of the nonrational soul.

Giordano Bruno elaborates panpsychism in the dialogue *Della causa, principio e uno* (Bruno 2002) by following the concept of the world soul. When he distinguishes between principles and causes, he identifies the efficient cause with the universal intellect, which is the highest faculty of the world soul. The world soul forms the material world creatively by means of the intellect. Forms are thereby created by the soul and are in a certain sense identical to it. Bruno also uses the concept of souls as principles of movement in his cosmology. In the dialogue *La cena de le ceneri*, he speaks about the souls of stars as sentient and more rational than humans are. Bruno's emphasis on the entire world and all its parts being animated can be read in three different ways. In the monistic way, he would accept only one substance, which exists composed of the matter and soul as its form. In the dualistic manner, he would consider both principles as independent substances, and even Bruno could also be interpreted in a pluralistic way, for he shifts the atomistic level. According to Bruno in *Della causa*, everything has a part of the spiritual substance, the spirit is in everything, and there is no minimal body which is not animated.

Tommaso Campanella in his panpsychic thoughts follows both the Platonic and Empedoclean traditions. In the *Philosophia sensibus demonstrata* (disp. IV, pp. 322–323),

which is a defense of Telesio, he uses the concept of the world soul and cites a passage from Ficino's commentary to *Enneads*, where he describes it as a vital and sensual breath penetrating the entire cosmos. The animal spirit springs from the world soul, and as fire vivifies and nourishes the world, and thus the heavens are in the world as a breath of the heavenly spirit (Campanella 1992; Ernst 2010). In *Del senso delle cose e della Magia*, Campanella follows Telesio's pansensism from the very beginning. He emphasizes that everything is sentient and argues in favor of panpsychism by means of an argument against the emergence: what is in the effect, must be in the cause. The elements are therefore sentient, although different entities have a different level of sensation (Campanella 1925; Ernst 2010). Campanella later connects panpsychic thought with his doctrine of primalities (potentia, sapientia, amor), provided that the middle primality "sapientia" can be considered as the development of the doctrine of universal sensation. All things are endowed with a certain sensation which was infused into them by wisdom (Headley 1997). According to Ernst Cassirer, Campanella's theory of knowledge, in particular, is from the very beginning panpsychic: the subject can perceive the object provided both have the same nature; meaning we feel the same life that is given to us (Cassirer 2000).

Impact and Legacy

Renaissance panpsychism created the philosophical framework of William Gilbert's theory of magnetism (Gilbert 1958), and the influence on seventeenth-century philosophy and science, in particular on Spinoza, Leibniz, Henry More, and Newton, has been discussed (Skrbina 2005). Panpsychism is sometimes wrongly confused with pantheism, both terms being associated with Giordano Bruno's impact on Baruch Spinoza. Among modern panpsychic philosophers (William James, Charles Hartshorne, Thomas Nagel, etc.), Gustav Fechner admired Marsilio Ficino and Paracelsus due to their panpsychic thoughts.

Republic

Abstract

The term “pantheism” only emerged at the end of the seventeenth century and was connected in the eighteenth and nineteenth centuries with a specific interpretation of Baruch Spinoza’s philosophy. Nevertheless, already in this so-called Pantheismusstreit, Giordano Bruno was labeled the predecessor of modern pantheistic thought. Nicolaus of Cusa, as a follower of Meister Eckhart, also later began to be viewed as a pantheist, as he was suspected of holding a similar heresy as Eckhart and the medieval philosophers Amaury of Bene and David of Dinant. Provided pantheism is defined in the strict sense as the identity of God and nature, as the etymology of the word indicates (pan, all; theos, God), it would seem that this “crude” pantheism was unfamiliar to Renaissance philosophers. Both Nicolaus of Cusa and Giordano Bruno advocated in a certain sense the immanence of the divine in the world but also simultaneously viewed a difference between God and nature and ascribed transcendence or at least transcendental aspects to God.

Heritage and Rupture with the Tradition

Three different philosophical concepts were formulated, which were recognized as heresy in the Middle Ages and later labeled as pantheism. Amaury of Bene followed the metaphysics of Johannes Scotus Eriugena at the beginning of the thirteenth century and was condemned for holding a doctrine about God as the form of everything (*Deus est forma omnium*). Shortly thereafter David of Dinant was condemned

because of the identification of God with matter (*Deus est materia omnium*). Meister Eckhart was accused of heresy in the fourteenth century apart from other things because he identified God’s essence with his own essence. The statements of Amaury of Bene, David of Dinant, and Meister Eckhart seem to be in conflict with the orthodox position as it was formulated by Alexander of Hales in the thirteenth century that in God all things are identical with God’s essence (*omnia sunt in ipsa divina essentia*). All these medieval accusations appeared once again in the accusation of heresy directed against Nicolaus of Cusa in the fifteenth century.

Innovative and Original Aspects

Nicolaus of Cusa was attacked by the Heidelberg theologian Johannes Wenck in his work *De ignota literatura*, which is a reaction to Cusanus’ work *De docta ignorantia*. Wenck animadverted Cusanus that he considered God to be a creature (God is a stone) and man and God as identical (Hopkins 1981). Cusanus indeed speaks in the *De docta ignorantia* (I, xxiii, 70) about God as a form of forms (Hopkins 1985). In the *Apologia doctae ignorantiae* (30), however, which he wrote as an apology against Wenck’s accusation, Cusanus explicitly rejects Amaury’s heresy. He defends himself by means of a reference to his own metaphysics, especially to the principles of learned ignorance.

The metaphysical framework of Cusanus’ philosophy is derived from the Neoplatonism of John Scotus Eriugena and Dionysius Areopagite. (Moran 1990) Cusanus borrowed the concept of the world as God’s self-manifestation from these thinkers on the one hand and the concept of negative theology on the other hand. This means that he uses the idea of emanation of reality from One as the first principle and its return to it, which could lead to an identity of God and the creature. He also, however, promoted the concept of a God who is radically different standing above affirmations and negations in the sense of negative theology. It enables Cusanus to claim both that God is the being of all things

and that he transcends all things. Cusanus elaborates this Neoplatonic tradition with the help of the concept of *explicatio/complicatio* (*De docta ignorantia* I, III, 111): “God is the enfolding (*explicatio*) and unfolding (*complicatio*) of all things, in so far as he is enfolding, in Him all things are Himself. . . in so far as he is unfolding, in all things He is that which they are” (Hopkins 1985). In a certain sense, as the coincidence of opposites (*coincidentia oppositorum*), it can even be stated that the stone is God and that God is stone. God is thus the absolute being of everything, and all things have their perfect reality only in God. In God they are nothing else but God. This leads Wenck to accuse Cusanus of heresy: if God is the absolute essence of all things, all things have the same essence. This is also why Wilhelm Dilthey considers Cusanus the creator of modern pantheism (Dilthey 1921a).

Cusanus, however, escapes from pantheism, for he created a language which enables him to describe God’s transcendence more precisely than Meister Eckhart (Dupré 2006), especially by means of the doctrine of contraction (Moran 1990). Only God is absolute, whilst all other things are contracted (*De docta ignorantia*, III, IX, 150) (Hopkins 1985). It is not possible to put an identity between God and creature due to this distinction. All things have their own contracted essence due to which they differ from one other. God as the absolute essence is the absolute essence of all things, but the ontological difference between God and the creature still remains, and God’s transcendence is confirmed.

Giordano Bruno followed Nicolaus of Cusa and can also be in a certain sense labeled as a pantheist, for several signs of pantheistic thought, and in an even larger degree than with Cusanus, can be found in his work (Dilthey 1921b). Bruno’s philosophy, however, can be read in a way which questions the pantheistic interpretation (Lechner 2014). In the dialogue *Della causa, principio e uno*, Bruno elaborates the panpsychic doctrine of the universal soul penetrating and animating the entire world and its parts by means of the universal intellect (Bruno 1958). The universal intellect is the efficient cause of the world, but there is no evidence that he

identifies it with God (Kristeller 1964). When Bruno speaks of substance, at a later point, he means the only one substance, which is God, and everything else is its accident. In addition, he considers the universe as a substance, which is one and infinite, and all multiplicity is only the multiplicity of its appearances. It seems therefore that the distinction between the world and God disappears in Bruno’s thought. Nevertheless, Bruno simultaneously makes a difference between the physical universe and the universe of archetypes.

God as an internal principal is immanent in the world, thus we can find divinity in every part of the universe, states Teofilo in the dialogue *Della causa*. At the same time, God as the prime cause differs from the world as the cause differs from its effect. For this reason, Bruno refers to the universe as the image of the first cause. It seems therefore that Bruno still holds a difference between God in nature and God the creator, as between the immanent and transcendent God (Eusterschulte 1997).

Another sign of pantheism is Bruno’s concept of the infinite universe. Bruno creates an equivalence between possibility and reality in God, of absolute power and its object. The infinite object of his action must therefore be equivalent to its active omnipotence. This can imply the identity of the infinite God and the infinite universe (Pisarek 2003). It can be interpreted in a different way, however, as the manifestation of infinite God in the infinite universe, but this does not mean that the infinite world is strictly identical to God. The world is concrete whilst divinity is abstract and absolute (Blum 2012).

In the dialogue *Spaccio della bestia trionfante* (Bruno 1958), Bruno refers to the veneration of gods in animals, plants, etc., and subsequently formulates the pantheistic sentence “nature is God in things” (Bruno 1958). “One” as the principle responsible for the variety of its manifestations on a cosmological level plays a similar role in the philosophy of religion as it justifies the multiplicity of its representations in religious behaviors (Blum 2010). The crucial point with respect to pantheism lies in the fact that God as unity manifests itself in plurality, and

therefore the difference between God and nature is underlined (Blum 2010).

The indefiniteness of Bruno's philosophical approach with respect to pantheism and the impossibility to judge if he was a pantheist or a Neoplatonic dualist could indicate that the application of the modern concept of pantheism to Renaissance authors is artificial (Kristeller 1964).

Impact and Legacy

The terms "pantheist" and "pantheism" were only created at the end of the seventeenth century and were connected with the interpretation of Spinoza's philosophy. In 1789, as Friedrich Heinrich Jacobi published his book *On the Doctrine of Spinoza, in Letters to Mendelssohn* (Scholz 2004), pantheism was explicitly associated with Giordano Bruno's philosophy, for as the first appendix, Jacobi added an excerpt from Bruno's dialogue *Della causa* to his book and praised it as the purest and the most beautiful sketch of pantheism. The view of Bruno as a predecessor of modern pantheism subsequently disseminated in the period of the Enlightenment. Friedrich Schelling made out of Bruno the speaker for his own pantheistic system, and Georg Wilhelm Friedrich Hegel paid attention to Bruno's Spinozist pantheism in his *History of Philosophy*. The English Romantic poet Samuel Taylor Coleridge drew his pantheistic notions from Jacobi's excerpt of Bruno, as well as from German mysticism (McFarland 1969), and thanks to him the knowledge of Bruno and pantheism spread in Britain (Gatti 2011). The view of Bruno as a pantheist was also popular in Italy, for instance, in the work of Vincenzo Gioberti who celebrated Bruno as an exponent of true, healthy, and moral pantheism (Garin 2008).

Ludwig Feuerbach was also influenced by Hegel and Jacobi's readings of Bruno (Gooch 2013). Following Feuerbach, Marxist historiography differentiated between so-called materialistic pantheism derived from Bruno and Spinoza and idealistic pantheism connected with German mysticism starting from Meister Eckhart up until

Jacob Boehme. German mystics focused, however, on the unity of the soul and God than on the pantheistic identification of the world with God (Wollgast 1972, 1988).

The interpretation of Renaissance pantheism in the nineteenth century was completed by Wilhelm Dilthey in his analysis of European pantheism. Dilthey praised two Renaissance thinkers crucial for this phenomenon. In his view, Nicolaus of Cusa created the basic concepts of the new pantheistic worldview, and Giordano Bruno developed them for the new modern image of the world (Dilthey 1921a).

Contemporary authors dealing with pantheism try to define and differentiate its various forms (Levine 1994, Mander 2012) but are unambiguous in the assessment of Renaissance pantheists. Both Cusanus and Bruno are viewed more as "panentheists" than "pantheists" following the concept of Karl Krause. Panentheism is defined as the theistic form of pantheism substituting the identity of God and the world with the catchword "everything is in God." Since both the immanence of God in the world and its transcendence are held simultaneously, this concept corresponds better to Bruno's and Cusanus' philosophies.

Paradox in Renaissance Philosophy

Paola Ugolini

Department of Romance Languages and
Literatures, University at Buffalo, Buffalo,
NY, USA

Abstract

This entry explores paradoxes from their origin in classical antiquity to their dissemination in the Renaissance, defining the nature of paradoxes and attempting to explain the reason for their success in the Renaissance.

Heritage and Rupture with the Tradition

Paradox, from the Greek *para doxa* (literally, “contrary to common opinion”) is a mode of expression in which opposites can coexist, and that can be true and false at the same time. The purpose of paradoxes is to be deliberately provocative, forcing the audience to reconsider notions that may have been taken for granted as true. The term can be applied to several categories of knowledge – to the point of appearing multifaceted, ambiguous, or even indecipherable (Genovese 1992, p. 9). The most common form of paradox – and the most widespread in Renaissance thought – was the so-called rhetorical paradox: a formal defense (written according to the rhetorical rules of a defense or a praise speech) of something that was not considered deserving of being praised or defended.

Paradoxes were central to Stoic philosophy, and were employed to express moral topics that contradicted common opinion (only the wise man, even when poor, is really rich, etc.). It was precisely thanks to Stoicism that the rhetorical genre

known as paradoxical encomium, where a speaker will develop praise of something considered unworthy of praise, was developed. The form was considered a way for a speaker to showcase his skills, allowing him to impress the audience with a eulogy of a subject considered impossible to ever describe in positive terms. A well-known paradoxical encomium was Gorgias' *Encomium of Helen* (paradoxical since it praised the woman considered responsible for the Trojan war).

In Roman antiquity, paradoxes were the subject of an influential work by Cicero titled *Paradoxa Stoicorum*. Cicero's piece of work is noteworthy precisely because it mentions the notion that Stoics called "paradoxes" all things that are "remarkable" and "contrary to everybody's opinion" (*admirabilia contraque opinionem omnium*).

The rediscovery of classical culture in the Renaissance, and the following vogue for classical forms, was at the origin of the stunning popularity that paradoxes enjoyed in the Renaissance (Colie 1966; Figorilli 2008). Paradoxes became so popular that the scholar Rosalie Colie has compared the dissemination of paradoxes in the early modern period to an epidemic (Colie 1966, p. 33). Colie sees paradoxes as typical of periods characterized by active intellectual speculation. As a consequence, she has identified the main reason for the success of the paradoxical form in the intense intellectual activity of the Renaissance, which often saw many contradictory ideas and systems compete or intertwine. The paradoxical mode offered an easy, readily available instrument to explore complex ideas, and, most importantly, to challenge assumptions and to fuel with new life a variety of fields of knowledge. In addition, in a refined culture that delighted itself in the practice of *serio ludere*, rhetorical paradoxes were the ideal instrument to delight audiences with a display of wit and erudition. Colie also underlines how paradoxes always exploit competing value systems, thus challenging orthodoxy. As such, they become an indirect criticism of any absolutism (Colie 1966, p. 10).

The best-known example of paradoxical encomium of the Renaissance is most likely Erasmus' *Praise of Folly* (1511), where the author uses the stratagem of Folly praising her impact on the world as a way to express a bitter satire of the society of his times, criticizing especially the corruption of the Church. One more influential piece of work was Ortensio Lando's *Paradossi* (1543), a collection of thirty paradoxical theses, ranging from poverty being preferable to riches, to demonstrations of Aristotle's and Cicero's ignorance. Like Erasmus's text, Lando's work has a strong Christian undertone, related to the intrinsically paradoxical nature of Christianity, that teaches that the humble will be exalted, the persecuted will be rewarded, and that the poor are the real rich (Corsaro 2000, pp. 23–25). In a period of tense religious debates, and where the Church was increasingly seen as corrupt and in need of reverting to its original simplicity, paradoxes became also a way to express potentially controversial opinions without excessively exposing oneself.

Paré, Ambroise

Born: 1510, Bourg-Hersent

Died: 20 December 1590, Paris

Simone Guidi

Sapienza Università di Roma, Rome, Italy

Abstract

Among the greatest surgeons of his time, Ambroise Paré is universally considered the

founder of French surgery and of modern surgery generally. He was one of the most influential figures in the development of modern surgery. He reintroduced surgery on the cleft lip, which had already been pioneered by the Arabs, and worked on the designing of various prostheses to replace amputated limbs. His most famous book is *Des Monstres et Prodiges*, dedicated to monstrous births.

Biography

A physician, philosopher, and writer. Born in Bourg-Hersent (Laval) in 1510. Died in Paris on 20 December 1590. Among the greatest surgeons of his time, Ambroise Paré is universally considered the founder of French surgery and modern surgery generally. Of humble origins (his father seems to have been a barber-surgeon and his mother a prostitute), Paré began his training as an apprentice barber-surgeon in the late 1520s and served in the French army as a barber-surgeon from around 1533. His military position gave him the chance to travel in Europe, but above all to gain comparative experience, which would be decisive for developing his empirical and pragmatic method of diagnosis. From this point of view, his battlefield experiences during the Piedmont war in Francois I's army were particularly significant. Running out of oil, which in those days was used boiling on wounds, Paré had started using simple bandaging and noticed that that way the wounds healed more quickly. Rejecting the predominant medical tradition of his time, rooted in an anthropological and metaphysical framework, Paré began promoting a pragmatic and simple approach to surgery, modernizing its practices and even the theorizing behind them. On returning to Paris he gained membership in the Barbers' Corporation and began practicing as a surgeon. In 1552 he served in the army again and was the first to practice the ligation of the arteries in leg amputations. In later life, he was greatly honored but

also contested. He became Henri II's surgeon and from 1554 was the Master of the St. Cosma College of Surgeons. In this role, however, he had frequent disagreements with professors at the Sorbonne. Later he was Chamber Surgeon to François II and Charles IX and then First Surgeon to Henri III.

Innovative Aspects

Dedicated to real-life experimentation and direct surgical practice, Paré was not a man of letters, and that contributed to his sharp break with the medico-anthropological tradition of his time. He was one of the greatest innovators and one of the most influential figures in the development of modern surgery. He excelled in obstetrics and introduced the crown drill. He also reintroduced surgery on the cleft lip, which had already been pioneered by the Arabs, and worked on the designing of various prostheses to replace amputated limbs (Poirier 2005; Delacomptée 2007). His first publication, in 1545, was entitled *La méthode de traicter les playes faictes par flèches, dards et semblables*. In 1572 he published his *Cinq Livres de Chirurgie*.

Teratology

His most famous book, and the one that was most philosophically influential, was undoubtedly *Des Monstres et Prodiges*, of 1573 (Paré 1971). Here Paré distinguishes "monsters" from mere "wonders." Wonders come about in nature only in a passive way, whereas "monsters" are natural but unusual phenomena, occurring beyond but not against the normal course of nature. Often, however, they foretell sinister events, since they have significance as "signs." In an innovative etiological approach to the theme of "monsters" (which highlights the consolidation in the late sixteenth century of specific attention to "second causes"), Paré recognized various types of causes: supernatural and divine causes, i.e., the glory or the anger of God, who

used monsters for His own purposes, which included punishing mankind, and natural causes, such as too much seed or not enough, the imagination, the narrowness of the womb, an unsuitable position of the mother during pregnancy, falls or knocks during pregnancy, hereditary illnesses, and deterioration or mixing of the seed. To be added to these were the tricks of charlatans, sorcerers, and the Devil (Céard 1971, 1977; Kappler 1980).

Parker, Henry

Born: 1640, Rutton (Sussex)

Died: 1652

Alessandro Arienzo

Università degli Studi di Napoli “Federico II”,
Naples, Italy

Abstract

A political theorist and pamphleteer during the 1640s, Henry Parker was the most influential defender of the Parliamentary cause during the Civil Wars and the early years of the Long Parliament. His theories of popular sovereignty, political representation, and Parliamentary absolutism constitute an original and innovative contribution to the early modern political philosophy.

Biography

A political theorist and pamphleteer defending the Parliamentary cause during the 1640s, Henry Parker was born in 1604 in Rutton, Sussex, the fifth son of Sir Nicholas Parker, a respected gentleman of a country gentry family who served as deputy lieutenant, sheriff, and shire knight. Henry was educated in a Protestant family, far from religious or political radicalism. He got his BA in St. Edmund Hall in 1625 and his MA 3 years later. In 1638, he was called as a barrister having entered Lincoln's Inn in 1630. From this date to his first pamphlet in 1640 (the *Case of Shipmony*), very little is known. Writing for private interests was among his activities during the 1640s, a period in which he was also employed by William Fiennes, Viscount Saye and Sele, his uncle and patron, as a secretary. Between 1641 and 1642, he wrote a long apologia on behalf of the Vintners' Company, and in 1643 he was engaged by the Stationer's Company. In 1646 he was into the service of the Merchant

Adventurers in Hamburg, and on their request, he wrote in 1648 the book *Of a Free Trade* in which he attacked the ideas of unlimited competition and defended the privileges of incorporated merchants. Despite their occasional nature, in all his commissioned writings, Henry Parker linked the interests of private parties with the common interest of the English nation, showing an original vision of politics and economics.

Political Theory

His most important writing, the *Case of Shipmony*, is a defense of mixed constitution and of the role of the Parliament in taxation, based on *salus populi* and necessity claims. This volume had a relevant impact on contemporary debates on extraordinary taxation and the role of the Parliament and is today regarded among the most important pamphlets of the pre-revolutionary years. He also published several important pamphlets on religious issues, such as *The Question Concerning the Divine Right of Episcopacie* (1641), *The Grounds of Ecclesiastical Regiment* (1641), and *A Discourse Concerning Puritans*, all of which were printed in support of Lord Say against his enemies and in favor of the supremacy of the public magistrate in settling religious disagreements. In 1642 he published his *Observations upon His Majesties Late Answer and Expresses* in which, responding to Charles' declarations, he rebutted godly monarchical power and placed absolute power in the hands of Parliament in all extraordinary cases. The relevance of Parker's treatise relies on its clear-cut expression of Parliamentary absolutism based on the representative nature of the Parliament. These principles will be further expressed in his *Jus Populi*, published in 1644, in which he developed his theory of the representative nature of the English Parliament and its popular sovereignty. However, he was a fierce opponent of the Levellers and of any radical movement. In 1642 he was appointed secretary to the Parliamentary Army and in 1645 secretary

to the House of Commons. He was also at the service, as secretary, of Robert Devereux, third Earl of Essex, a prominent military leader for the Parliamentarians. In the following years, he served for Henry Ireton, and in 1649, he was secretary to Oliver Cromwell's army. Henry Parker died in 1652.

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Paolo Paruta (Venice 1550–1598) was the mouthpiece of the Venetian political system in the Age of Lepanto (end of the sixteenth century). Born in Venice to a family of the low nobility, he studied at the University of Padua, the main center of Italian Aristotelianism. In his first book, the dialogue *Della perfettione della vita politica* (first edition: 1579), Paruta uses the Aristotelian structure of the *Nicomachean Ethics* to set up a dialogue among Venetian laymen and churchmen at the Council of Trent (1563), in order to revamp the choice for the active life in the service of the Venetian State, seen as the historical embodiment of the ideal republic. In the posthumous *Discorsi politici* (1599), Paruta left behind this idealistic and traditional vision of politics, in order to dialogue with the Florentine sixteenth-century tradition (Machiavelli and, above all, Guicciardini): the Myth of Venice is not dismissed, but it needs to come to terms with the power of history. In these 25 texts, Paruta tries to defend his beloved Republic (he was the historiographer of state), justifying it in all her political and military choices (i.e., neutrality), because of her quality of adaptation to historical conditions – *prudenza* is the most important political virtue, for this author. In his *Soliloquio* (1599) Paruta shows all the anguish suffered from his choice of the *vita activa*: in this sort of counter-text of *Della perfettione della vita politica*, the Venetian author reconsiders critically the choice that he has taken.

[Paruta, Polo](#)

Biography

Paolo Paruta was born in Venice to a family of the low nobility and of Luccan roots: from 1558 to 1561, he studied philosophy and rhetoric at the University of Padua, among the main centers of Italian Aristotelianism. During the first part of 1560s Paruta was also involved in Venetian literary life: he founded a minor *academia* hosted in his own house, and he was part of the city's poetic circle ruled by the old Domenico Venier (heir of the movement of Petrarchism, planted in Venice by Pietro Bembo) (Benzoni [2014](#)).

In December 1562 Paruta began his political career, being accepted before ordinary time in the *Maggior Consiglio* (the assembly of Venetian noblemen). Between 1563 and 1564, he had his first diplomatic experience, joining the mission of Venetian ambassadors Michele Surian and Giovanni da Lezze at the Imperial Court in Vienna. Surian was a great political leader of the Republic: he introduced his young *protégé* to the praxis and the values of Venetian diplomacy. On their return trip (1563), the two Venetian ambassadors stopped in Trent, where the Council of the Catholic Church was ending: here they joined Venetians (many of them laymen and above all churchmen) such as Nicolò da Ponte and Matteo Dandolo (Ambassador of the Republic of Venice at the Council, both laymen), Giovanni Grimani and Daniele Barbaro (Patriarch of Aquileia, and his successor), Filippo Mocenigo (Archbishop of Nicosia), and Agostino Valier (Bishop of Verona). This community would become the setting of the philosophical discussions contained in the *Della perfettione della vita politica*, the first book published by Paruta several years later (1579), in which all the fictional characters would take the stance of their real equivalents (Mocenigo plays the stoic philosopher, Barbaro the clerical humanist, Surian and Da Ponte the supporters of the political way of life) (Candeloro [1936b](#); Curcio

1969; Benzoni 2014; Paruta 1852; Benzoni and Zanato 1982).

The success of the *Perfettione* is witnessed not only by the three editions during the author's lifetime (1579, 1582, 1586), but above all by the fact that in 1580 a marginal writer, such as he was at that time (he has only published, in 1572, a funeral oration for the Venetian fallen in the battle of Lepanto), was chosen by the *Consiglio dei Dieci* (the ruling assembly of the *Serenissima*) as the new *Storico Pubblico* (the Official Historiographer of State). In fact, he was the right man to write the history of Venice in a way that would please the patrician ruling class. With his privileged access to the secret state archives, Paruta started his enterprise in 1580. At his death, the work was still incomplete, but the 12 books of his *Historia Vinetiana* were published in Venice in 1605. Although his charge was to write the Official History of the Republic in Latin like his predecessors, Paruta decided to write it in Italian, as he would do for the rest of his literary production (Candeloro 1936a; Zanato 1981; Cozzi 1997).

In the second part of his political and literary life (1580–1598), Paruta reached the upper part of Venetian State *cursus honorum*: from 1592 to 1595 he was sent to Rome as Ambassador at the Papal Court of Clement VIII. On the other hand, he left the philosophical and rhetorical celebration of the traditional Myth of Venice to move into the more dangerous field of historiography, where he wished to justify the perfection of the *Serenissima* and her deeds (Wars of Italy, War of Cyprus and Battle of Lepanto, *Pax Asbrugica* and subsequent Venetian neutrality in late sixteenth-century Italy). Adding to his *Historia Venetiana*, Paruta composed numerous *Discorsi politici*, upon several classical and modern historical themes, 25 of them were published after his death (1599), in Venice, by his sons (Benzoni 2014).

During his last years in Venice (1595–1598), Paruta devoted himself not only to politics and historiography: according to Valerio Marcellini's dialogue *Il Paruta ovvero dell'immortalità dell'anima* (still unpublished, written probably in 1601 but set before 1598), he joined some Aristotelian discussions in Venice with the poet Celio

Magno, Francesco da Molin, Girolamo Cappello, Orsatto Giustinian, Paolo Loredan, and Giacomo Barozzi (Carpané 2007).

Heritage and Rupture with the Tradition

At the *Studio* of Padua, Paruta attended some humanistic courses, such as those of the Aristotelian Marcantonio Passeri (also known as "Genua") in philosophy and of Adriano Beretti (also known as "Valentico") in theology and Holy Scripture. Valentico was a Dominican friar commentator of St. Paul, then Inquisitor of Venice. He may also have attended the courses of Bernardino Tomitano (logic), Francesco Robortello (humanities and rhetoric), Carlo Sigonio (humanities and history), and Marco Mantova Benavides (law). During his stay in Padua (1558–1561), he may have met cultural personalities such as Sperone Speroni, Daniele Barbaro, Agostino Valier, and Gian Vincenzo Pinelli (Candeloro 1936a).

Paruta had a strong Aristotelian heritage, as witnessed by the structure of *Perfettione*: the discussion of the virtues (in book two) follows the scheme of Aristotle's *Nicomachean Ethics*. Like his university masters, Paruta's Aristotelianism is not dogmatic, but eclectic: Aristotelian issues are combined with Platonism, Stoicism, and scholastic features. Paruta follows Genua and Gasparo Contarini in fighting against the thesis of the mortality of the soul (still discussed in Padua thanks to the living legacy of Pietro Pomponazzi) not only in his *Perfettione della vita politica* but also as a character in Valerio Marcellini's dialogue (Sgarbi 2016). Paruta departed from this university heritage, not in terms of its contents, but its aims: as Francesco da Molin (one of the author's mouthpieces, together with Michele Surian, Daniele Barbaro, and Matteo Dandolo) declares, the young Venetian nobles did not agree with their professors about the preference for the *vita contemplativa*, instead, they wished to be taught about the *vita activa*; furthermore, rather than trusting classical authorities such as Aristotle and Plato, they wished to test them through their own experience.

Paruta's philosophical works include, in addition to the *Perfettione*, the 25 *Discorsi politici* and his *Soliloquio*, a sort of examination of conscience written during his difficult embassy in Rome but published after his death, in 1599, at the end of the first edition of *Discorsi politici* (Paruta 1852; Paruta 1990). These works point to a second, clear heritage – the Venetian tradition. Paruta was the real heir of Gasparo Contarini not only in continuing to spread the Myth of Venice (Contarini, as recalled by Matteo Dandolo, explains the theory of mixed state at the end of Book Three of *Della perfettione*) but also in believing that the option for the *vita activa* had a religious value.

Written during the early 1570s, the three books of *Della perfettione* seem to be, at a first sight, just a simple transcription of the 3 days of dialogue in Trent in 1563; indeed, this work is not just a Venetian rewriting of Aristotle's *Nicomachean Ethics* but a strong political and literary operation (Benzoni 2005). Coming from the lower nobility, the young Paruta introduces himself as the mouthpiece of the Venetian patriciate revamping all the values of the patrician class (see, for instance, the numerous discussions about civic virtues such as nobility, magnificence, wealth) in the second part of the sixteenth century, when many young noblemen started to reject the wealthy but also demanding life of a Venetian ruler (Pompeati 1905; Cozzi 1961; Bouwsma 1968; Nuccio 1992; Sperling 1999). Paruta proposes again the old philosophical discussion about *vita activa* and *vita contemplativa* (stating his support for the former) because he wants every young nobleman to spend his personal life in the service of the state. After all, Venice is the perfect historical realization on earth of the ideal republic that the classical philosophers could only imagine in their books (Ulvioni 1981). Even the last and most famous part of *Perfettione* (the discussion at the end of book three of mixed government, based on Aristotle and Plutarch and the tradition of Venetian republicanism) should be read within this broader setting: the government of the *Serenissima* has not only a formal perfection lacking in the ancient

republics of Rome, Athens, and Sparta but provides the complete and concrete answer to fundamental human needs. Indeed, it represents the realization of the personal search for a fully happy life, of the classical and humanistic search for a perfect government, and of the Catholic search for a religious-oriented state after Machiavelli's political thought. In fact, in the last pages of the dialogue, Paruta depicts God himself blessing the rulers of the *Serenissima*, defenders of the true faith, without the intermediation of the Roman Catholic Church. Of course, this religious feature of the perfect state of Paruta's *Perfettione* was problematic in the Age of the Counter-Reformation: but, thanks also to the author's caution (i.e., the setting during the Council of Trent, not after it), the book encountered no problems with Catholic censorship (Benzoni 1999). Indeed, the three books of the *Perfettione* clearly reveal both their Renaissance values and their traditional Venetian ones (i.e., personal service to the state, the mixing between spiritual and political power its religious value, the Caesaropapism), in a sort of intentional anachronism that deliberately ignores both Machiavelli and Luther and was meant to inspire Paruta's fellow citizens.

Innovative and Original Aspects

The 25 *Discorsi politici* are no doubt the most original political work by Paruta. These single-topic political texts, dealing with ancient (above all, Roman) and modern history, enabled Paruta to discuss some theoretical problems brought up by historical facts – they were composed in the same years when Paruta was involved as ambassador in the main political events of his age and was writing his *Historia Vinetiana*.

Although Paruta is equally distant from the anti-Machiavellism and of Tacitism and *Ragione di Stato* literature, in the *Discorsi politici* he decided to fight his personal ideological battle against Machiavelli (the structure and often the topic are the same as Machiavelli's *Discorsi sopra*

la Prima Deca di Tito Livio) in a very original way (Curcio 1969; Baiocchi 1975/1976; Cervelli 1986; Comparato 2002). Instead of just condemning the Florentine author as a heretic, Paruta made use of his linguistic expressions and above all their political meanings (i.e., *stato* is not just an idealistic republic of wise men, but a territorial entity made up of land), while also discarding Machiavelli's depiction of the Republic of Venice as the worst state ever (Giani 2010/2011, 2016a, b). Paruta considers the Republic of Venice as surpassing the ancient Roman Republic so beloved by Machiavelli not in the field of the myth, but of history: only the *Serenissima* has saved its own independence and civil orders across the centuries (Rossi 2014). In the *Discorsi politici*, Paruta abandoned the traditional view of the Venetian political system he had used in the *Perfettione* (Venturelli 2013): in this work, the Republic of Venice still has a mixed government, whose leanings are more aristocratic than popular. This perfect *repubblica degli ottimati* is guided not by a monarch or a leader but by the anonymous class of *prudenterissimi senatori*, the wisest senators capable to use their *prudenza* (the ability to choose righteously, according to all historical circumstances). The aim of such a republic is not the same as Machiavelli's: Venice did not seek war and territorial conquest, but internal and international peace and the conservation of the state. So in his *Discorsi politici*, Paruta became the theorist of Venetian neutrality (Baiocchi 1975/1976; Silvano 1993).

In this book and his several historical works also, the contact with Guicciardini (praised in the *Perfettione*) is evident, especially in some key ideas such as the relevance of *accidenti*, or the criticism of the exemplariness of history.

The first part of *Soliloquio* is traditional and innovative at the same time. On the one hand, Paruta's condemnation of the vanity of political life recalls the old *querelle* between Pietro Querini, Paolo Giustinian, and Gasparo Contarini about the *vita activa* and *vita contemplativa*. On the other hand, those pages are a surprising overturning of the whole of *Perfettione*'s political

ideology: in Paruta's pained self-examination, every honor and every energy spent for the Republic seems to be nothing compared with the soul's thirst for an absolute God. Despite the pacifying end of *Soliloquio* (where a more balanced equilibrium between secular and religious needs seems to be reached), this distressing text is the witness of a proto-Baroque feature in the last years of Paruta's life.

Impact and Legacy

Paruta had no direct disciples: not only because of his shy personality but also because in the decade after his death, the harsh political and ideological struggle (see the Papal *Interdetto*, 1606–1607) between the Roman Church and the Republic of Venice left no place for the political equilibrium Paruta had tried so hard to find between Rome and Venice. Paolo Sarpi, the champion of Venetian jurisdictionalism, became the new mouthpiece of the *Serenissima* (Benzoni 2008): Paruta was welcomed in the Venetian literary tradition, but his figure had no significant legacy.

Outside Venice, Paruta's political thought was fundamentally misunderstood and reduced by his seventeenth-century readers to *Ragion di Stato* issues, dismissing his Renaissance roots (Giani 2014): Traiano Boccalini, in his *Ragguagli di Parnaso*, depicts Paruta as a defender of the state ruler against the interests of his subjects (the living Venetian *prudenza* has turned into a defense of the status quo and in an absolute form of moderatism). In the second half of the sixteenth century, Paruta (whose work had been translated into French during his lifetime) had a small *fortuna* in northern Europe, as witnessed by the German and English translations of his political works (Cervelli 1967).

Abstract

A jurist, humanist, and historian, a precursor of modern historiography, Etienne Pasquier studies the past to furnish practical responses to contemporary crises. In the *Recherches de la France* (1560–1621), Pasquier applies a marked national sentiment to his exploration of the origins of French history: his aim is to demonstrate to the French the glory of their history and their national institutions, without lapsing into fanatic patriotism.

Biography

Pasquier studied in Paris, Toulouse, and Bologna under illustrious teachers such as Hotman, Bau-douin, Cujas, and Alciato. He was a lawyer in the French Parliament, an office which led him to take part in the Estates General of Blois in 1588. In Antoine Loisel's *Dialogue des avocats*, he was defined as the ideal model of lawyer, on a par with Guillaume du Vair. He was a counselor first to Henry III and later to Henry IV, taking up ranks against the League on behalf of the latter. He distinguished himself in particular for the part played in the trial between the Jesuits and the University of Paris, which refused to accept them. In 1557 he married a wealthy young widow whom he had defended in court. Wishing to contribute to the reconciliation between Protestants and Catholics during the wars of religion, he engaged in a reconstruction of the historic origins of the unity of the French nation, going back to the country's pre-Christian past. In 1560 he fell ill as a result of accidental poisoning and withdrew to convalesce in Amboise and Cognac, where he began to work on the ten volumes of the

Recherches de la France (1560–1621); this was his most important work, which continued to occupy him for the next 40 years. Whereas the first generation of humanists had spent all its eloquence on the glorification of antiquity, showering contempt on the literary attempts of French writers, Pasquier in the *Recherches de la France* instead applies a marked national sentiment to his exploration of the origins of French history. His is indeed a veritable apologia for France, operating on three levels. Firstly, he claims that the French language has equal merit with Latin and more than Italian. Secondly, he argues that the French church succeeded in withstanding the Reformation and Papal imperialism. Thirdly and finally, he argues that in the French constitution, royal power and moderate parliamentarism are harmoniously complementary.

The *Recherches* is a work of history in the fullest sense: Pasquier consults original sources, court documents, and chronicles of the period. His aim is to demonstrate to the French the glory of their history and their national institutions, without lapsing into fanatic patriotism. A precursor of modern historiography, he studies the past to furnish practical responses to contemporary crises.

Pasquier also wrote a book called *L'Interprétation des Institutes de Justinien* (which was not published until 1847), in which he analyzes both French law and Roman law. He devoted the last years of his life to biblical exegesis. He also wrote some minor poems in the style of *La Pléiade* and some excellent pieces of literary criticism. He was also known for the amorous dialogue entitled *Le Monophile* (1554) and for several political works including the *Anti-Martire* (1590), a pamphlet in which he attacked those who saw the assassination of Henry III as martyrdom, and *Autorità regale* (1615), an essay in defense of the political rights of the king. His correspondence, which reads almost like a diary of the events of the time, was published in 1619 and offers a vivid commentary on the political and military episodes of the wars of religion (1562–1598) as well as extensive discussions of historic and literary matters.

Patronage in the Renaissance

Malcolm Hebron

Winchester College, Winchester, UK

Abstract

The patronage system of early modern Europe decided appointments to offices in church and state and was a dominant force in cultural life. Patronage started with the prince and spread downward through courtiers to their own circle of dependents. Grants, patents, offices, and financial rewards flowed through interlocking networks of personal relationships: patrons were often themselves intermediary figures, bestowing favors while at the same time serving as the clients of those higher in the hierarchy. So ubiquitous is patronage in the Renaissance world that the term has been stretched to embrace disparate practices. A patron might be an individual (monarch, prince, aristocrat, cardinal), a family, or a

corporation (guild, monastery, confraternity, city council), with multiple overlaps between these types. Acts of patronage cover arrangements from the nepotistic assignment of government contracts to the commissioning of altarpieces and the provision of time and opportunity for the exercise of scholarly labors. Motives and perceived benefits for the patron were varied. Instances of patronage in the cultural field range from a relatively simple contracted job to long-drawn-out personal relationships involving familial proximity, political allegiance, and binding customs such as ritual gift exchange.

The arrangements of patronage certainly influenced cultural production and social behavior. In order to win favor from their superiors, aspirants to patronage often emulated courtly manners, cultivating the appropriate fashions, tastes, and mannerisms. An artist or intellectual patronized by a court thereby obtained a certain status and a connection to peers, and these arrangements could flow back into the work. At the same time, a patron might be a useful bulwark behind which dangerous ideas could be explored (as in the case of Hobbes; Sarasohn 1999). Writers sought individual patrons to reward their works, and patrons gained prestige through association with virtuosic artistic and intellectual achievements. Works of art and books took on significance as material objects, signifying the qualities of their owner and signaling subtle messages of power and prestige. Patrons may have operated for their own political interests, but could equally exercise taste and discernment, taking a part in the creative process itself. Through patronage, philosophy remained closely tied to civic and political life; even if desired, the ivory tower removed from worldly activity was rarely available to the Renaissance philosopher.

Heritage and Rupture with the Tradition

Renaissance patronage inherited an older tradition, locked into feudal relations. Wealth and

power were personally invested in great families and individuals, which were distributed to clients. Patronage could operate at several removes: a local dignitary might put in a word on a client's behalf with someone low in the court, who could pass the request to someone higher up, and so on. Political life was perceived as a pattern of social relationships. A client applied for a post or favor through personal networks, while a patron could accumulate personal and political capital through sponsoring work of a high quality. In the Middle Ages, the chief sources of patronage were the court and the church (which might operate through multiple agents, such as monastic houses and eminent individuals). With the rise of cities and the city-state, other sponsors such as guilds and merchant bankers of the *popolo grosso* families took on a role as patrons of art and scholarship (Asch and Birke 1991; Cooper 1996).

Innovation and Original Aspects

The nature of the patron's role and the motivations behind it were shaped by a number of cultural forces. Civic humanism encouraged the contribution of the wealthy and powerful to public service and the common good. The active exercise of virtue – which included patronage – was praised over the idea of inherited nobility. The concept of *magnificenza*, the generosity of spirit and action first praised by Plato as a quality of the philosopher-king, was taken to include the financing of great works of art and architecture: this was praised as a virtue by Leon Battista Alberti (*De re aedificatoria*, 1443–52) and analyzed by the Neapolitan humanist Giovanni Pontano (*De magnificentia*, 1498). Courtesy books like Castiglione's *Il cortegiano* (1508–28) endorsed the picture of the cultivated noble, skilled in appreciation of the arts. Church strictures against usury have been related to the patronage of religious art perceived as an act of piety. Motives need not have been entirely self-interested and may frequently have been mixed: a commission may be at once an act of piety, civic philanthropy, and political self-advertisement. Renaissance patronage offered scope for the patron to exhibit

connoisseurship and is related to the rising status of the artist and writer (Constantinidou 2010; Gilbert 1998).

Patronage could range from the commission of a single work to a client living in his patron's household and thus taking on a certain social status with the lifestyle to match. The Florentine Medici, as well as being patrons of the visual arts, present a notable example of a great family with interests in philosophy, working in the spirit of humanist revival of the colloquies of antiquity. Cosimo de Medici founded the Platonic Academy, led by Marsilio Ficino. Lorenzo de Medici sponsored Ficino's translations of Plato from Greek into Latin and was patron to Pico della Mirandola. The gatherings at the Medici court brought philosophers, poets, and artists close together, encouraging a symbiosis of image and idea, expressed, for example, in the allegorical paintings of Botticelli (Kent and Simons 1987). Such associations provided a model for other countries (Knecht 2008). The variety of patron-client relations make generalizations difficult, and the subject has been most fruitfully approached at a microhistorical level: case studies of intellectuals and their patrons include work on Machiavelli (Landon 2013); the Valori family and their relation to Savonarola, Ficino, and Machiavelli (Jurdjevic 2008); Galileo and the political networks of Rome (Biagioli 1993); and the relations of Thomas Hobbes and William Cavendish, the Earl of Newcastle (Sarasohn 1999). Detailed studies have also been made on the shaping of literary careers and expression in the period (Lytle and Orgel 1982).

Some general points may, however, be ventured. One is the trace left in the language and form of written productions. Verbally, the habits of deference and supplication created a language based on the terms of love and friendship. Dedicatory epistles are characterized by effusive flattery and a claim to intimacy that may not have existed; thus the Petrarchanism of the sixteenth century, with its codes of adoration and humility, provided a useful rhetoric for systems of patronage. These codes could be misunderstood at the time and are hard to interpret today. Cultural

products like books were presented as gifts, and were reciprocated with material objects, or posts such as tutor and household secretary. A book was both ornament and commodity. Writers without their own means were dependent on patrons for a livelihood; without copyright, even books with a relatively large readership generated little income. Since philosophy seldom operates successfully in the open market, some form of sponsorship and patronage has always been necessary for its production. In later centuries this has more usually been the corporate university rather than the single individual. But the role of benefactor, the successful individual as patron of the arts and learning, remains today and owes much to Renaissance precedent.

Abstract

Péter Pázmány (Oradea, 4 October 1570–Bratislava, 19 March 1637) was a Jesuit, Archbishop of Esztergom, cardinal, Hungarian writer, theologian, politician, university founder, and church organizer. He studied in Transylvania (Cluj-Napoca, 1583–1588), Poland (Krakow, Jaroslaw, 1588–1590), Austria (Vienna, 1590–1593), and Italy (Rome, 1593–1597). He was professor of philosophy and theology at Graz University (1597–1607). His philosophy lectures survived in manuscripts (published in the nineteenth century). He moved back to Hungary in 1607 and lived in Trnava and Bratislava since the medieval

archbishopric of Esztergom was under Turkish control. He visited Rome several times, in 1632 as Ferdinand II's official ambassador to Pope Urban VIII. As Archbishop of Esztergom (from 1616), then cardinal (from 1629), he played a mediating role between the papacy, the Holy Roman Empire, the Hungarian estates, the Protestants, and the Turks. More than 1200 letters of his, written in Hungarian, Latin, German, and Italian, survived (Pázmány 1910–1911). He founded several ecclesiastical institutions, the most important among them was the Jesuit university in Trnava (1635), which moved to Buda in 1777. Its legal successors today are Eötvös Loránd University and Pázmány Péter Catholic University, both in Budapest. Pázmány did significant work in proselytization; he personally converted several noble families to the Catholic faith, thus Hungary, mostly Protestant at the end of the sixteenth century, started to become a country with a Catholic majority. His literary work is diverse and prolific, containing some 40 works in Hungarian and Latin language, about 12,000 pages altogether (Pázmány 1894–1904a), Pázmány (1894–1904b). Most of them are controversial writings against the Protestants. In 1605 he published the first Hungarian text about the Islamic empire. He composed the first surviving Catholic prayer book in the Hungarian language (it was printed four times in his life: 1606, 1610, 1625, 1631); he translated *De imitatione Christi* by Thomas à Kempis (1624), and he published his collected sermons (1636). His main work is *Igazsággra vezérlő Kalauz* (Guide to Truth; 1613, 1623, 1637), a synthesis of Catholic theology and apologetics in more than 1000 pages.

Heritage and Rupture with the Tradition

Concerning tradition, Pázmány emphasized the importance of continuity in his works. He stated that he did not want to invent new things, but he would take after his predecessors (he used the

example of the bee and the spider). This is why his Hungarian works contain thousands of Latin quotations, with precise source references. Various layers of earlier cultural tradition can be traced in his philosophical and controversial writings, sermons, and great synthesis, the *Kalauz*: the Bible, ancient Greek and Roman erudition, the Church Fathers, Saint Thomas Aquinas, all the significant works of controversial literature from the sixteenth and seventeenth century as well as decrees of Catholic councils. He cited contemporary Catholic theologians such as Martin Azpilcueta, Luis Molina, Petrus Navarrus, Domingo Soto, Francisco Suarez, Gregor Valencia, and Gabriel Vasquez frequently. Roberto Bellarmino, with whom he corresponded, is an important referential basis in *Kalauz*, and two of Pázmány's controversial writings were connected to Bellarmino's controversies: *De ecclesiastica libertate circa causam Veneti interdicti* (1606, Paolo Sarpi and the Venice conflict) and *Diatriba theologica* (1605, against William Whitaker). In 1627 he defended his *Kalauz* against Wittenberg theologian Fridericus Balduinus. His university lectures held in Graz, which survived because he planned to print them as a philosophy textbook, are typical works of Jesuit school philosophy. Pázmány intended to be objective, e.g., he did not miss reviewing the theory by Copernicus. At the beginning of the seventeenth century, he was reprimanded by the Jesuits because of his views on the doctrine of grace.

Pázmány taught for 3 years in Graz Pázmány (2003), and some of his lectures survived: extensive texts on dialectic and physics and a shorter one on metaphysics. These works meet the requirements of school philosophy and the Jesuit *Ratio studiorum* (1586, 1599). He quotes authors from antiquity to his own time, mostly from original editions, and not from florilegia. His curriculum is not just a reproduction of a contemporary philosophy coursebook but is elaborated by himself. In each case, he discusses and quotes every important earlier standpoint in detail, and he states his opinion about

them based on rational arguments. He thinks philosophy is important from the point of view of theology (*philosophia est ancilla theologiae*). Sometimes, he takes stands against Aristotle and even Saint Thomas Aquinas. He refers to Saint Thomas many times in his *Dialectica*, less in his *Physica*. He follows mostly the Jesuit school of Coimbra, especially Fonseca, and he refers to his student, Molina, several times. In his *Dialectica*, Thomism is dominant (there are many references to Cajetanus), among the Salamanca theologians he prefers the works of Soto, Canus, Báñez, and Medina. He mentions the works of the Jesuit Toletus many times. However, he never calls himself a Thomist. In his *Physica* he pays attention to Renaissance philosophers, as well; he delineates their works mostly when discussing questions of natural sciences. He refers to Zabarella, Cardanus, Fracastoro, Alessandro, and Francesco Piccolomini many times. He knows the works of Giovanni Pico della Mirandola, Bessarion, and Marsilio Ficino. He presents the views of Copernicus in detail. Of later authors, he mentions Lipsius's book about Rome. He rarely refers to Plato, it cannot be proved that he had a comprehensive knowledge of his works, obviously, the Aristotelian thinking is determining for him. Out of the Jesuit scholastics, two works by Francisco Suárez are the most important in Pázmány's philosophical works, the *Disputationes Metaphysicae*, which is one of the most important references in Pázmány's *Physica*, and Suárez's commentary on Aquinas's *Summa*. All in all, Pázmány quotes about 200 authors and 280 works. In philosophy, Pázmány seeks final verification in rational acceptability, and not in authorities. He presents the different standpoints with strong critical sense; his decision about their acceptability is based on his personal consideration and the arguments and proofs brought up. He is characterized by eclecticism and some sort of voluntarism. His originality and individuality reside in his method of treating the subject matter.

Innovative and Original Aspects

Pázmány's writings are best characterized as scientifically well established. This applies to the richness of sources used by him as well as the syllogistic way of thinking in his controversies. He synthesized his earlier works in *Kalauz*. He was an outstanding philologist: in order to create a perfect text and also to insert his new writings, he constantly rewrote his works and published them in new editions. Primarily he used rational arguments, but he also took advantage of the devices of emotional effects. He often quoted proverbs from live language in his Hungarian works.

Impact and Legacy

Pázmány's first – schematic – biography was written by a contemporary Jesuit in Munich, Jeremias Drexel. The Jesuit lexicon by Alegambe (1643) contains his name and work. His influence on Hungarian literature is very significant. His prayer book and his Kempis translation were published many times in the following centuries. The text of his sermons was quoted by lots of preachers in their own sermons until the end of the eighteenth century.

Pendasio, Federico

Born: ca. 1525, Mantua, Italy

Died: 19 December 1603, Bologna

Simone De Angelis

Zentrum für Wissenschaftsgeschichte, Karl-Franzens-Universität Graz, Graz, Austria

Abstract

Pendasio taught natural philosophy at the universities of Padua and Bologna. He commented on Aristotle's works on physics but also on the books of *De Anima*, in which he followed Alexander of Aphrodisias. The peculiarity of Pendasio's commentaries lies in his textual exegesis of *De Anima*, which on the one hand complied with the restrictive directions of the bull *Apostolici regiminis* (1513) and which on the other hand was open toward an innovative empirical investigation of the human body. In particular, his interpretation of the material intellect promoted the study of the human brain, which obtained remarkable results through the work of the young anatomist Costanzo Varolio on the origin of the optic nerve.

Biography

Federico Pendasio of Mantua was born around 1525. As a colleague of Jacopo Zabarella, he was one of the most influential Aristotelians in Padua during the second half of the sixteenth century, despite having published practically any printed works. Pendasio's renown was most of all based upon his teaching philosophy as a professor at the universities of Padua and Bologna, but it was also rooted in his relationship to the Mantuan House of Gonzaga, especially to the later Cardinal Ercole Gonzaga. Prior to studying philosophy under Ludovico Buccadiferro in Bologna (before 1545), he underwent his initial training in Mantua, home also to Pomponazzi. In 1548, he obtained his *doctor philosophiae* in Mantua. At the age of

23, he already taught logic in Pavia, and in 1552/1553, he was accepted at the Mantua *Collegium Physicum*. He also taught at Cardinal Ercole Gonzaga's court in Mantua, where he served in the diplomatic corps, when the Cardinal unsuccessfully tried to advocate comprehensive clerical reforms at the ecumenical Council of Trent (1562). From 1564 to 1565, Pendasio held the second Chair of Philosophy at Padua (on equal terms with Francesco Piccolomini) and was subsequently – once more as competitor to Piccolomini – appointed first Chair of Philosophy (1565–1571), following Marc' Antonio Genova. During those years, Jacopo Zabarella was teaching logic in Padua, while Girolamo Capodivacca (a follower of Galen's) lectured practical medicine, and Girolamo Fabrici d'Acquapendente taught surgery and anatomy. Between 1571 and 1603, Pendasio was Professor of Philosophy at Bologna University (counting Cesare Cremonini among his students). In Bologna, he also fostered the study of anatomy. This was coherent with his interpretation of Aristotle's theory of the soul, in which he followed Alexander of Aphrodisias. Pendasio died on 19 December 1603 in Bologna.

Teachings and Impact

At the end of the sixteenth century, lecturing philosophy at Padua, primarily meant teaching natural philosophy, also because the discipline was becoming increasingly specialized and was no longer taught in conjunction with medicine. Thus, Pendasio most notably commented on Aristotle's works on physics – *De coelo*, *Meteorologica*, and *De generatione et corruptione* – but also on the books of *De Anima*, which Paduan students read in the 3rd year of the *cursus artium* in the context of Aristotle's *Parva Naturalia*, i.e., his writings on the psychology of the senses.

The philosophical and historico-cultural significance of Pendasio's commentaries lies in his textual exegesis of *De Anima*, which on the one hand complied with the restrictive directions of the bull *Apostolici regiminis* (1513) and which on the other hand was open toward an innovative

empirical investigation of the human body. The Paduan “theory of the twofold (i.e. philosophical and theological) truth” (Baldini 1998, p. 624) therefore results in a specific practice of textual exegesis, which Pendasio – in the eyes of the theologians and judges of the *Sanctum Officium* – exemplified in his commentaries on Aristotle (Poppi 1993, p. 101): In accordance with the abovementioned bull, it was neither permitted to teach the mortality of the individual soul (following Alexander of Aphrodisias) nor the notion that the *anima intellectiva* was a single one in all human beings (as Averroes claims, who adopted the neo-platonic interpretation provided by Themistios in his famous commentary on *De Anima*). Thus, the respective passages of Pendasio’s *Lectiones de anima* point out that Aristotle was mistaken and that his opinion was not in accordance with the Christian truth, therefore needing to be corrected. However, this did not hinder Pendasio from interpreting Aristotle’s *De Anima* along the lines of Alexander, who set forth a naturalist theory of the *intellectus materialis* or *intellectus possibilis*. Pendasio’s *Lectiones de anima* of 1566–1567, which have been preserved as manuscripts, explicitly verify this practice of interpretation.

The core element of Pendasio’s Alexander exegesis is the theory concerning the form of “simple” and “complex” bodies put forward in *Lectio* 28. This theory of Alexander, based on the combination of as well as the interaction of forces between matter and the primary qualities (“warm,” “cold,” “moist,” and “dry”), does not only explain how the entire corporeal world of minerals, metals, and even more complex organisms pertaining to the fauna and flora came into existence; it also provides an explanation of the emergence of intellectual capability. As opposed to the Platonists, Alexander advocates the thesis that the soul does not exceed the body’s capabilities and powers (*dynamis*). Pendasio’s commentary also significantly deviates from the commentary of Averroes, who criticized Alexander’s theory of form and interpreted the *intellectus materialis* as a “simple substance” or pure potentiality detached from matter. Other than Averroes, who discusses Alexander’s thesis of the

emergence of material intellect from the body’s complexity by referencing another passage from Alexander’s *De intellectu* and who thus adheres to the textual level of the commentary, Pendasio points beyond the textual level toward the practice of dissecting the body, which had been established in Padua since Vesalius: According to Pendasio – who directly paraphrases Alexander’s repeatedly edited treatise *De Anima* (1495, 1538) – those who want to gain understanding of the material intellect have to practice the anatomy of the human body (Alexander of Aphrodisias 1538, p. 8). This indicates a notable change in the method as to how knowledge claims were generated, which also illustrates the close relationship that existed in Padua between the study of anatomy and the Aristotelian theory of the soul: The students who attended Pendasio’s lectures on *De Anima* and possibly also Fabrici d’Acquapendente’s lectures on anatomy indeed possessed well-founded knowledge of the soul (De Angelis 2008).

Pendasio starts discussing *De intellectu* only in *Lectio* 29, where he characterizes Alexander’s concept of the *vis intellectiva* as a faculty of the material intellect which is able to integrate intellectual forms (*species intelligibilis*) and which also has a physiological substratum that is natural warmth (*calor naturalis*). Thus Pendasio embeds thinking processes into a more comprehensive organicist concept, since, according to Aristotle’s *de Juventute et Senectute, Vita et Morte*, preserving or destructing the *calor naturalis* leads to the general preservation or destruction of organic life. At the same time, Alexander in *De intellectu* also clarifies the instrumental character of the material intellect. He understands it as a mere reservoir for the intelligible forms (*eideis*) which enter the human intellect via mental processing of sensory data. He considers the actual acts of thinking to be performed by the *intellectus agens* which, however, he (as opposed to Aristotle in *De Generatione Animalium* II, 3) does not consider as coming from “the outside” or as Divine intellect. Due to its capacity of being active (*poietikós*), the *intellectus agens*, in Alexander’s view, rather belongs to the human intellect itself. It is against this backdrop that Pendasio can dismiss Averroes’s critique of Alexander and has his students consider

that “Averroès non intelligit Alexandrum” (Pendasio, Ms 1264, f. 449). This is because Averroes alleged that Alexander had subsumed the *intellectus materialis* under the Aristotelian definition of the soul (*anima*) as an *actus corporis organici* and that he had attributed active properties to the material intellect which, however, it cannot possess according to Alexander’s theory of the intellect (which defines the material intellect as *pura potentia*, i.e., as a mere disposition for perceiving intelligible forms) (ibid. f. 446).

To the same extent as he presents himself as exegete of the Aristotelian text in these instances, favoring Alexander’s naturalist reading over the Averroesian Neoplatonist one, Pendasio is also convinced that Aristotle’s philosophy does not present the whole truth, but only that part of it in which the Stagirite was able to comprehend as a natural philosopher who analyzes phenomena by taking sensual perception as his starting point. In the third lecture cycle on *De animae immortalitate*, Pendasio thus switches to the argumentative mode of scholastic Aristotelianism which had been renewed at the beginning of the sixteenth century by Dominican theologians Tommaso de Vio and Crisostomo Javelli, and the aim of it was to re-Christianize the theory of the soul. Central concepts of the “re-Christianized” Aristotle were, firstly, the *creatio nova*, which explained the recreation of the individual human soul as a creationist act of God and which caused the biological part of the body’s generation (*generatio*) to be transcended; the context of this creationist logic, secondly, sustained the idea of a mode of thinking which relinquishes the notion of mental images and is thus dissociated from the body: “*ut possit separata a corpore sine phantasmate intelligere*.” By that, it also became possible to argue in favor of the intellectual soul’s immortality. However, as Pendasio points out at the end of his lecture, such a line of argumentation is better suited for a theologian than for a philosopher (De Angelis 2010, pp. 120–122).

Contrary to what older scholarship occasionally suggests, Pendasio considering the naturalist and scholastic lines of reasoning to be on a par is

by no means contradictory. Rather it gives expression to rules of exegesis and commenting practices applied to the theory of the soul – *secundum theologos* and *secundum philosophos* – which Pendasio exercises in both directions. Yet, these practices also reflect the two prevailing schemes in the Italian educational system of the sixteenth and seventeenth centuries: academic Aristotelianism at the universities and scholastic Aristotelianism at the monastic schools (Baldini 1998). In this context, it appears plausible to suppose that Aristotelianism suffered the most severe damage from within, through the discrepancy between those two discordant forms of Aristotelianism (Gaukroger 2002, p. 48). However, looking back at the many years of Pendasio’s professorship of natural philosophy in Padua and then in Bologna, they were most notably the lectures on *De Anima*, in which he reasoned *secundum philosophos*, that took the strongest effect in the 1570s. In Bologna, the young anatomist Costanzo Varolio (1543–1575) was to particularly profit from Pendasio’s authority: Since the Bolognese anatomists doubted their younger colleague’s knowledge claim, instead of giving a lecture on Aristotle, Pendasio had a brain dissection conducted in his lecture hall, during which Varolio was able to demonstrate to the assembled academic audience that he had discovered the origin of the optic nerve in the rear part of the spinal cord (Varolio 1573, f. 14v; De Angelis 2011, p. 254). What this significant episode finally shows is that this sort of “proof,” which is considered to be “the standard of proof” at the London Royal Society, e.g., in Robert Boyle’s experimental philosophy, already existed at the sixteenth-century Italian universities in the context of anatomical practice (De Angelis 2010, p. 255).

Pereira, Benito

Born: Ruzafa, 1535

Died: Rome, 6 March 1610

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

Benito Pereira, S.J., was a Spanish Jesuit philosopher who lived during the sixteenth and early seventeenth centuries. While still in his teens, Pereira joined the Society of Jesus, for which religious order he would hold a number of educational responsibilities. After helping to establish a college in San Pablo, Spain, Pereira left for Italy. He eventually found his way to the Jesuit Collegium Romanum where he held a chair teaching scripture. In addition to his several scripture commentaries, Pereira also authored the *De communibus omnium rerum naturalium principium*, which, like many of the *cursus* at the time, was expansive in scope and detail. The Jesuit died in Rome in 1610.

Biography

Benito Pereira (Pererius), S.J. (Ruzafa, 1535–Rome, 6 March 1610), was born on the east coast of Spain in Ruzafa, a community near Valencia. Pereira came to be familiar with the Society of Jesus through his interactions with the Jesuit priest Juan Jerónimo Domenech (1516–1592), who had been tasked with the responsibility of founding the College of San Pablo (Solana 1940, 373). Pereira entered the Society of Jesus in 1552 while still in his teens. Domenech left San Pablo and Spain altogether and headed for Sicily and eventually, beyond that, to Rome. Pereira followed Domenech throughout all these moves and finally stayed in Rome, where he spent his entire life teaching and

writing. He was a professor of many disciplines and arts including grammar, rhetoric, philosophy, theology, and scripture. On at least two occasions, he taught the entire 3-year course of philosophy which consisted of logic, physics, and metaphysics (Blum 2006, 280). What is more, if Pereira had his way, he would have extended the 3-year cycle by half a year to allow more time for the study of metaphysics (ibid., 281). In addition to metaphysics, Pereira developed a reputation as an excellent teacher of logic (ibid., 282). Beyond his skill in philosophy, Pereira mastered many biblical languages – including Latin, Greek, Hebrew, Chaldean, and Syriac – which made him particularly outstanding in scriptural studies and led to his attainment of the chair of sacred scripture in the Jesuit Collegium Romanum. Pereira died on 6 March 1610 (ibid.).

Given Pereira's diverse teaching interests, one is hardly surprised to find that his writings cover a large spectrum of subjects ranging from scriptural commentaries (e.g., his *Commentariorum in Daniele Prophetam*, *Commentariorum et disputationem in Genesim*, and *Selectarum disputationum in Sacram Scripturam*), polemical theological treatises (e.g., *Adversus fallaces et superstitiosas artes*), and, of course, philosophy (viz., *De communibus omnium rerum naturalium principiis et affectionibus*). Relatively few of Pereira's works reached publication and so there are quite a few texts that are available only in manuscripts. Though Pereira's philosophical ideas can be found throughout all of his texts – for instance, he addresses the nature and creation of the rational soul in his commentary on Genesis – his principal work that addressed explicitly philosophical issues is his *De communibus omnium rerum naturalium principium* (*De comm. omn.*). Its title alone, as some have suggested, indicates that Pereira intends to engage critically Renaissance – and oftentimes anti-Aristotelian – natural philosophers whose volumes (e.g., Telesio's *De rerum natura iuxta propria principia*, Pomponazzi's *De naturalium effectuum causis*, and Portius's *De rerum naturalium principiis*) intended to give an exhaustive account of nature and its principles (Blum 2006, 279).

Pereira's treatise, first published in Rome in 1562, is expansive in length – extending to 15 books in total – and in the issues it addresses. Pereira divides his work into two principal parts. The first, containing books one through nine, pertains to the principles and causes of things. In the second part, containing the remaining six books, the general properties of all natural things such as quantity, location, time, and motion are explained (*De comm. omn.*, *praefatio*, fol. 2). Though Pereira's treatment of the philosophy of nature shares many points of continuity with the broader scholastic Aristotelian tradition, there are some points made in his work unique to the Jesuit himself (Solana 1940, 386–97). Perhaps his most significant methodological uniqueness is a distinction Pereira draws within metaphysics, that most universal science treats the transcendentals and general features of being as being (*ens ut ens*), between two distinct sciences. First, there is that science that treats the transcendentals and the most universal things. Second, there is that science that deals with the highest kind of beings, namely, the intelligences (*De comm. omn.*, lib. 1, c. 7, fol. 23). In addition to this distinction that Pereira draws in metaphysics, I shall consider only two further noteworthy examples of his originality, viz., his thinking on individuation and the relationship between *essentia* and *esse*.

Pereira explores at length but ultimately rejects the Scotist and Thomistic claims that individuation follows upon haecceitas (*De comm. omn.*, lib. 6, c. 10) and signate matter (ibid., lib. 6, c. 11), respectively (cf. Solana 1940, 386). The Jesuit, in contrast, thinks that the principle of individuation stems from both matter and form. Some have suggested that, in a way, Pereira anticipated the position of later Jesuits, such as Francisco Suárez, who held that, since being and unity are convertible, the principle of individuation is simply the entity of a thing itself (Solana 1940, 386). Still, for Pereira, since among the principles of a thing's entity form holds pride of place as act over potentiality, he views individuation as following chiefly upon a thing's form (*De comm. omn.*, lib. 6, c. 12). Pereira's theory leads to the obvious question: if form is that which serves to individuate things, how can it also serve as a source of community

wherein things are grouped according to the same species or genus (Solana 1940, 387)? Put another way, one may ask: is a form universal or particular, for it would seem incapable of functioning in both capacities? Pereira's answer, somewhat reminiscent of Avicenna's essence per se, is that forms are neither: "Form per se is neither universal nor singular," Pereira writes, "for if it were universal, there would never be a singular thing" (*De comm. omn.*, lib. 6, c. 12). But, as Pereira points out, if there were no singular thing, there would be no generation or corruption – which obviously runs counter to our experience – since it is the singular that is generated or corrupted (*ibid.*). Nor can forms per se simply be singulars for if that were the case, one could never have a science since science always pertains to that which is universal (*ibid.*). Rather, the form's supposed universality results, Pereira holds, solely from the intellect's abstractive agency, whereas particularity resides extrinsically in the productive agent's power to bring about a particular effect with its own attendant formal determination (Solana 1940, 387).

Beyond the issue of individuation, Pereira also held unique theories about the distinction between *existentia* and *essentia*. As had been the case with individuation, the Jesuit rejected the Thomist teaching – in particular, its position on the real distinction and maintained, again in a fashion similar to other Jesuit philosophers such as Suárez, that there is only a distinction of reason (Solana 1940a, 388). For Pereira, the principal argument used to establish the identity between a creature's essence and *esse* stems from Aristotle's own insight in *Metaphysics* 4.2 that being and unity are the same (*De comm. omn.*, lib. 6, c. 15, fol. 379). What is more, Pereira notes, even for Thomas himself, that "being [*ens*] is imposed. . . to signify essence in the order of existence." Since to exist (*existere*) is transcendent, the Jesuit adds, existence is necessarily either the same as being (*ens*) or some transcendental attribute of being or a *passio entis*. But existence is not a *passio entis*; therefore, Pereira concludes that it is the same as being itself (*ibid.*).

Much of Pereira's argument for the identity between *existentia* and *essentia* consists in a sustained critique of the Thomist position which

advocates a real distinction. Pereira offers several noteworthy arguments for the identity of *existentia* and *essentia* of which I shall only discuss two. I discuss these two because they represent Pereira's direct engagement with and critique of Thomistic metaphysics in the establishment of his own doctrine. In one argument Pereira notes that for the Thomists, *existentia* is understood in terms of act. But, as the Jesuit points out, act must be understood in terms of first or second act. If it is first act, then it is identical to the being's form; if it is a second act, then it is merely an operation in which case *existentia* would not in fact be an act (*ibid.*, fol. 380). Pereira leaves the reader to conclude that if *existentia* is not an act distinct from form or a being's essential determination, then *existentia* and *essentia* are not really distinct but instead identical.

In another argument Pereira points out that, for the Thomists, *essentia* supposedly stands in a relation of potency to *existentia*. But, as he also notes, potency is either essential or accidental. Now essence cannot stand in an order of essential potency to *existentia* since that would imply that the essence would not, of itself, be complete since it would need its complement of *existentia*. But to hold that essence is incomplete is inconsistent with what the Thomists themselves teach. Nor does essence have a kind of accidental potency for the reason that "existence [*existentia*] is not an accident" (*ibid.*). Thus, Pereira concludes: *existentia* and *essentia* are not really distinct. Rather, if a distinction is to be found between the two, it can only be a distinction of reason (*ibid.*, c. 16; fol. 382). In defining his position, Pereira meets the objection that if *existentia* and *essentia* were identical in creatures, then creation would have no need of God as its creative cause. He denies the conclusion and notes that, if anything, maintaining some sort of *distinctio in re* between the two would seem to imply the undesirable consequence of creaturely coeternity. Here, Pereira cites Henry of Ghent who maintains that creatures have *esse essentia* from eternity but only receive *esse existentiae* upon God's decision to create them in *rerum natura*. Pereira rejects Henry's teaching and maintains instead that when God creates man, for example, He brings

man into being together with his essence simultaneously and not from a coeternal *esse essentiae* (ibid., fol. 383).

Date and Authorship

The oldest extant copy of *Peri hypsous*, a tenth-century manuscript of Byzantine origin (Bibliothèque National de France ms. Parisinus Graecus 2036; Mazzucchi 1989), presents several conjectures about the authorship of *Peri hypsous*. The table of contents on fol. 1v attributes the work to “Dionysius or Longinus,” while the heading of the work on fol. 178v ascribes it to “Dionysius Longinus.” Following these scribal speculations, the author of the treatise was called “Longinus” or “Dionysius Longinus” throughout the early modern period and was often identified with the third-century rhetorician and philosopher Cassius Longinus (213–273 AD). In the nineteenth century, this identification has been rejected (Russell 1964; Heath 1999). The anonymous author is nowadays conventionally called Longinus or Pseudo-Longinus, and the treatise is usually situated in the intellectual context of the Augustan period (Mazzucchi 2010; De Jonge 2012) or the first century AD (Russell 1964; Porter 2016).

Peri Hypsous

Pseudo-Longinus’ treatise *Peri hypsous* aims to illustrate the effects of “the sublime” (*hypsos*) in literature and to demonstrate how it can be attained. According to Pseudo-Longinus, the sublime incites wonder and amazement (*ekplêxis*) in readers or listeners. The greater part of the treatise is dedicated to a discussion of the five sources that may lead to sublimity, which for Pseudo-Longinus are “greatness of thought,” “emotion,” “figures of speech,” “diction,” and “word arrangement.” Pseudo-Longinus’ prime examples of sublimity are Homer, Demosthenes, and Plato, and in general *Peri hypsous* takes its

Peri Hypsous, On the Sublime

Wieneke Jansen

Centre for the Arts in Society (LUCAS), Leiden University, Leiden, The Netherlands

Abstract

Pseudo-Longinus is the author of the Greek treatise *Peri hypsous* (*On the sublime*), which was rediscovered in the fifteenth century and which played an important role in early modern literary theory.

illustrations from the classical Greek canon, with the notable exceptions of Genesis and Cicero. In a lengthy digression (33–36), Pseudo-Longinus expresses his preference for writers whose greatness causes them to make mistakes, over flawless mediocrity. The final chapter of the treatise laments the loss of true sublimity in the author's time.

Rediscovery and Dissemination

After a period of almost complete obscurity in Late Antiquity and the Middle Ages, the codex containing *Peri hypsous* surfaced around 1468 in the circle of Cardinal Basilios Bessarion. About a dozen manuscript copies were produced in Italy in the fifteenth and early sixteenth centuries (Mazzucchi 1989). The *editio princeps* of *Peri hypsous* was prepared by Francesco Robortello and published in 1554 by Joannes Oporinus in Basel. Up to 1650 ten editions of Pseudo-Longinus' treatise were published across Europe, including several translations in Latin and Italian (Weinberg 1950).

Reception

Pseudo-Longinus' treatise exerted its greatest impact on early modern critical thought through the publication of a French translation of the work in 1674 by the French critic Nicolas Boileau-Despréaux. Already in the late sixteenth and seventeenth centuries, however, the treatise had found its way into theories of rhetoric, poetics, and the visual arts, as well as classical and biblical scholarship. *Peri hypsous* was occasionally mentioned in general works on rhetorical theory, such as Antonius Lullus' *De oratione libri septem* (1558), Pedro Juan Nuñez' *Institutionum rhetoricarum libri quinque* (1593), and Gerardus Joannes Vossius' *Oratoriarum Institutionum libri sex* (1606). In the 1580s Francesco Patrizi reflected on poetic wonder in Longinian terms in his *Della Poetica* (Weinberg 1961). Franciscus

Junius F.F. applied Pseudo-Longinus' ideas to the visual arts in his *De pictura veterum* (1637) (Nativel 2016). The treatise also attracted the attention of classical and biblical philologists, whose interest was sparked by the many citations that Pseudo-Longinus' treatise preserved. Marc-Antoine Muret was able to identify Catullus' *Carmen* 51 as a Latin adaptation of Sappho's fragment 31, after having discovered Sappho's poem in *Peri hypsous* (Aulotte 1958). Scholars like Isaac Casaubon, Daniel Chamier, Hugo Grotius, and Nicolas Caussin were in turn fascinated by Pseudo-Longinus' paraphrase of Genesis 1.3–9 in *Peri hypsous* 9.9 (Declercq 1994; Till 2006; Ossa-Richardson 2014; Lazarus 2019). Pseudo-Longinus' treatise moreover played an important role in the works of literary critics such as Daniel Heinsius (Meter 1984; Jansen 2016), Guez de Balzac (Hache 2000; Gilby 2016), and Leone Allacci (Fumaroli 1986). In the Renaissance, Pseudo-Longinus did not become part of “mainstream” poetics and art theory, but his treatise did play a significant role in select early modern scholarly discussions about literature and aesthetics (Fumaroli 1986).

Perkins, William

Born: 1558, Marston Jabbett (England)

Died: 1602, Cambridge (England)

Laura Carotti

Scuola Normale Superiore, Pisa, Italy

INSR, Florence, Italy

Abstract

William Perkins was a prominent theologian and Puritan preacher. After completing his studies at the University of Cambridge, he devoted himself to writing works on biblical exegesis and casuistry, to which he consistently applied the method of dichotomous bipartition characteristic of Ramus' dialectic. Frances Yates also identified Perkins as an intellectual who sustained a bitter controversy against Alexander Dicson, author of a treatise on mnemonics influenced by Bruno.

Biography

William Perkins was born in 1558 to Thomas and Hannah Perkins in the village of Marston Jabbett in Warwickshire. In 1557 he was admitted to the University of Cambridge, where he earned a bachelor's degree in 1581 and a master's degree in 1584. After a troubled and turbulent youth, he came to the faith and became a devout Puritan. From an intellectual point of view, meeting Laurence Chaderton, who became his mentor, was decisive. Chaderton introduced Perkins to the teachings of Petrus Ramus, the French philosopher who had developed a new type of logic that followed the natural pace of human thought and fled from schematics and Aristotelian formalism.

From 1584 until his death, Perkins carried out his pastoral and teaching activities at the University of Cambridge. In 1595 he married a young widow, with whom he had several children, and died 7 years later.

A fervent preacher, Perkins wrote about 50 treatises, which enjoyed 11 editions after his death: subjects included exegeses of biblical passages, texts on predestination, salvation, justification by faith alone, the errors of Catholicism, and cases of conscience. In all his works, he rigidly followed the literal interpretation of the sacred text, and their peculiarity lies in the fact that in order to present his definitions and arguments, Perkins often used Ramus' method of proceeding by dichotomous partitions. Of particular importance are *The Art of Prophesying* and two works on casuistry, *A Discourse of Conscience* and *The Whole Treatise of Cases of Conscience* (Perkins 1970).

In the first of these works, Perkins sets up guidelines for the way preaching itself should be structured and organized: he illustrates his method of reading and interpreting the Bible, lists principles to follow in its explanation, and presents various expository methods to be used according to the type of listener (e.g., ignorant unbeliever, undecided, believer). But Perkins was noted especially for his work on casuistry, a branch of moral theology that examines situations in which there is a conflict between the moral norm and individual will. In *A Discourse of Conscience*, Perkins approaches the topic from a theoretical point of view, while in *The Whole Treatise of Cases of Conscience*, he analyzes many cases of moral dilemmas that a Christian may encounter and proposes practical solutions, oriented toward the skillful recourse to prudence, understood as a competence in particular situations and adroit handling of the circumstances.

Perkins' influence on Puritan theologians was profound, both in England and among those who emigrated to New England, and his works were translated into several languages (Beeke and Pederson 2006).

In the multifaceted figure of this Puritan preacher, Frances Yates convincingly identified the author of four polemic short works against Alexander Dicson (Perkins 1997; Yates 1966), expert on the art of memory who in 1583

published a treatise on mnemonics inspired by the teachings of Giordano Bruno, entitled *De umbra rationis et iudicii, sive de memoriae virtute Prosopopoeia* (Yates 1966; Ruisi 1998; Brotto 2014). In two polemical texts – the *Libellus de memoria verissimaque bene recordandi scientia* and *Admonitiuncula ad Alexandrum Dicsonum [sic] de artificiosae memoriae, quam publice proficitur* – Perkins bitterly criticized Dicson both from a technical point of view, insisting on the value of Ramus' dialectic, and for the hermetic atmosphere of his text, unacceptable for a rigid Puritan. Reacting to the Scottish intellectual's response in *Heii Scepsii Defensio pro Alexandro Dicsono Arelio adversus quendam G. P. Cantabrigiensem*, he composed two other pamphlets – *Antidicsonus cuiusdam Cantabrigiensis G. P. and Libellus in quo dilucide explicatur impia Dicsoni artificiosa memoria* – in which his explicit attack on Bruno showed that he knew Bruno's works and wanted to demonstrate their theoretical inconsistency (Carotti 2014).

Thus the figure of Perkins not only played a prominent role in the theoretical elaboration of Puritan theology but was also an important link in the knowledge of Bruno's doctrines in England.

Persio, Antonio

Born: 17 May 1542, Matera

Died: 11 February 1612, Rome

Sarah Bonciarelli

Ghent University, Ghent, Belgium

Abstract

Persio, Antonio – scholar and philosopher, a pupil of Telesio, and publisher of some Telesian treatises on natural philosophy; he wrote several (largely unpublished) works defending and clarifying the master's thought. Published works include *Tractatus novarum positionum in rhetoricis, dialecticis, ethicis ... adversus Aristotelem* (1575), *Trattato dell'ingegno dell'huomo* [Treatise on Human Intelligence] (1576), and *Del beber caldo, costumato dagli antichi Romani* [Of drinking warm, used by the ancient Romans] (1593). Persio analyzes and develops the concept of *spiritus* in master Telesio and places it in a Neoplatonic perspective (Garin 1989).

The author contributes to spreading the thought of his philosopher master while accentuating some particular aspects that end up bringing it within a Platonic tradition, only marginal in the original texts of Telesio (Fiorentino 1814).

Biography

Son of sculptor Altobello and Beatrice Goffredo, he is the first of five brothers.

Between the ages of 5 and 10, he suffers from a sort of paralysis of the limbs. Cured of the disease, he has a restless adolescence with disputes, injuries, and a brief period of imprisonment. He studies with the help of his uncle, humanist Leonardo Goffredo, and his stimulating family environment encourages his philosophical interests. His brother Antonio was to become abbot and Lincean and a faithful friend of Tommaso Campanella (Firpo 1940; Padula and Motta 1992). Persio continues his studies in the Franciscan monastery of Matera and later leaves the city due to differences with his father. He goes to Naples in 1560 where he becomes a priest and is appointed as tutor to the Orsini brothers and where he is ordained.

He meets Bernardino Telesio and becomes his friend and pupil, to the point that the philosopher wants to discuss with him the second edition of *De rerum natura iuxta propria principia*. The friendship with Telesio influences Persio who becomes a popularizer of the master's thought and subsequently elaborates his philosophy from a rereading of his doctrine.

In 1570, after having been in Rome for a period, he follows the Orsini brothers, to whom he is a tutor, to Perugia where he takes part in many local disputes and where he bonds with the Caetani brothers. Thanks to Camillo Caetani, he comes into contact with Paolo and Aldo Manuzio in anticipation of his transfer to Venice, which then takes place in the second half of 1572 (Carotti 2015).

During the Venetian period, Persio is tutor to Andrea Correr and will be until 1576.

In 1576 he moves to Padua where he becomes a parish priest and publishes *Trattato dell'ingegno dell'huomo*, in which he continued the Telesian theory of *spiritus* (Artese 1999). In 1590 he moves to Rome, first under the protection of Don Lelio Orsini, and later in the court of Cardinal Enrico Caetani. In Rome, he meets Tommaso Campanella and Galileo Galilei who, after his death, becomes promoter of the publication –

never completed – of his writings by the Accademia dei Lincei (Gomez 2013). In Rome, Persio publishes a medical treatise, *Del beber caldo, costumato dagli antichi Romani*. He dies in Rome in 1612 and, to crown a prominent intellectual path, is admitted to the Accademia dei Lincei the day after his death (Gabrieli 1933).

Innovative and Original Aspects

Persio's most famous work, published by Aldo Manuzio in 1576, is *Trattato dell'ingegno dell'huomo*, in which the author develops eclectic themes derived from Aristotelianism, Neoplatonism, and Stoicism (Wolfe 2004). In particular, Persio offers some methodological reflections on the importance of the senses and analyzes the most complex concept of Telesio's thought, *the spiritus*, the principle of body animation – movement, intelligence, and life – which operates and gradually organizes itself in matter (Walker 2000). Unlike other vernacular sixteenth-century logics, Persio tries to develop a physiology of knowledge based on the concept of “ingegno” (intelligence): “that part of the spirit by means of which we are able to understand things” (Persio 1999, 27). As Sgarbi says in his essay *The Italian mind: Vernacular Logic in Renaissance Italy*, “generally all operations may be reduced to various movements of the spirit, its states, and its temperament. Thus, in Persio's view, no real distinction between invention and judgment is possible, intelligence itself being the capacity to discover and judge, since they reside in the spirit” (Sgarbi 2014, 227). This logic distances itself from the traditional humanist vision and is more similar to a Neoplatonic perspective. In the treatise, Persio develops this concept, and, through a large number of Telesian and Ficinian citations, he places it within the broader framework of Renaissance Neoplatonism. He is so clearly inspired by Ficino that, according to the opinion of some scholars, we can reach the point of talking about plagiarism (Maggi 2010). In the text, Persio recognizes a fundamental unity and continuity in nature, and through this, a parallelism is made between the spirit of every animal – including man – and the

universal spirit (*anima mundi*), even though Persio cautiously maintains the principle according to which the human mind is formed directly by God and not by the universal spirit (Brann 2002).

The work *Del beber caldo costumato dagli antichi romani*, published in Venice, is from 1593. It is a particularly well-known text because, through it, Persio is part of a lively discussion that interweaves medical analysis with scholarly interests, seeking to establish whether the Romans used to mix wine with hot or cold water.

Supporting the warm nature of water means, in fact, supporting the Telesian idea that the only *spiritus* with which man is endowed and whose primary characteristic is heat, it must assume (to be maintained) elements similar to itself. This theory is in clear contrast with the theory of the supporters of the theory of humors and the presence of a plurality of spirits that must be balanced through opposing elements. Persio's treatise, which had the merit of placing the thematic nuclei of the debate within a broad theoretical framework, made the dispute even more animated: Flemish philosopher Giusto Lipsio and Tommaso Campanella intervened in his favor. The treatise is widely disseminated at the end of the 1500s and occupies a significant position within the complex cultural phenomenon that is Telesianism in the second half of the sixteenth century.

Impact and Legacy

The period that Persio spends in Venice is fruitful from the point of view of output.

In *De numero et qualitate elementorum*, Persio lashes out against Sebastiano Augeni's comment on *De natura humana* by Hippocrates. It is indirectly a critique of Aristotelian physics and a defense of Eleaticism and the affirmation of the warm nature of water, an element that is part of the thought of Telesio (Bolzoni 1992).

In 1572 with *L'Apologia pro Bernardino Telesio adversus Franciscum Patritium* (Florence, National Library, Magl., XII.39), Persio enters into the discussion between Telesio and Francesco Patrizi. In fact, it is Persio who fosters an

exchange of letters between the two authors during which confrontation is ignited on crucial aspects of Telesio's thought, such as the relationship between the senses and reason. In 1574 he writes *Disputatio habita in domo Iosephi Salviati cum Octavio Amaltheo, in qua tenet primum orbem non moveri a Deo effective* (Rome, Corsinian Library, Mss. Lincei, I), while the following year, *Liber novarum positionum* is published by the Giacomo Simbeni publishing house, in which Persio refers to a dispute on Telesian philosophy that took place in Perugia (Persio 1575). In the text, permeated by traces of Ramist dialectic, many opinions of the philosophical tradition are examined to subject them to critical scrutiny and offer a renewed encyclopedia of knowledge (Artese 1981, 1986, 1987). The public debate that involves this text arouses interest in the Cosentina Academy which, through Andrea Aletino, had an account of these discussions printed in Florence in 1576, entitled *Disputationes libri novarum positionum Antonii Persii, triduo habitae Venetii anno MDLXXV, mense Maio*.

The work of Persio is also distinguished by some writings to clarify the thought of Telesio and for the collection and curation of writings by the master such as *Varii de naturalibus rebus libelli* by Telesio (1590) which contains nine pamphlets on physical and medical-physiological subjects (Garin 1971, 1979).

In the Roman period, Persio writes three works of great importance. The first is *De recta ratione philosophandi*, a text of logical argument of which only the index is known, obtained through *Index capitum librorum Antonii Persii Lyncei Materani Civ. Rom. I.V.C. philosophi theologi praestantissimi. De ratione recte philosophandi et de natura ignis et caloris*, written by the will of the Accademia dei Lincei after his death by Giovanni Bartolini and published in Rome in 1615 by Giacomo Mascardi. The text also contains a list of numerous currently lost works by Persio. In *De natura ignis*, he maintained that heat was "an extremely rarefied substance or body" and included, in the end, a chapter about light. As Susana Gómez underlines, through Prince Cesi, Galileo was acquainted with Persio's work

and the Accademia's editorial project. It is possible that those ideas in that period strongly influenced Galileo's ideas on light and heat (Gomez 2013).

The second is *De natura ignis*, the manuscript of which is preserved in Rome, Corsinian Library, Arch. Linc., VI–VII, and *Del bever caldo costumato dagli antichi Romani*, published in Venice in 1593.

In the final part of his life, Persio returns to dedicating himself to juridical subjects and writes a work which, although unpublished, nevertheless has an extraordinary diffusion: *Trattato dei portamenti della signoria di Venezia verso Santa Chiesa e quante volte sia stata scomunicata*.

The work refers to the conflict that broke out in 1606 between the Republic of Venice and the Papal State, which was triggered by the arrest in Venice of two Catholic priests accused of common crimes and the adoption by Venice of a series of laws intended for the containment of ecclesiastical property. Following this crisis, the Pope inflicts excommunication on the Venetian Senate and the interdict – or prohibition of celebrating religious offices – throughout the Republic.

Perspective

► Optics, Renaissance

Perspective in Renaissance Philosophy

Filippo Camerota

Museo Galileo – Istituto e Museo di Storia della Scienza, Florence, Italy

Abstract

The term “perspective,” deriving from the Latin *perspicere* (to see distinctly), indicates a technique of graphic representation whose rules were established mainly by the artists and mathematicians of the Renaissance. The term is a vernacular form of the noun *perspectiva*, which in Medieval Latin designated the science of vision, translating the Greek *optiké*. The philosophers of “perspective,” devoted to the study of vision from the ninth to the fourteenth century, investigated both physiological aspects, especially in the Arab world, and mathematical ones, retaining the ancient threefold division of the discipline into “optics” (direct vision), “catoptrics” (reflected vision), and “dioptrics” (refracted vision). This science, called *perspectiva naturalis* or *communis*, dealt with the visual and light rays propagating in a straight line, as established by a fundamental axiom of Euclidean optics (Euclid 2007, *Catoptrics*, postulates I and II). The artists and mathematicians of the Renaissance applied its principles to the representation of the visible world, codifying the rules for a science of drawing that profoundly influenced the development of the applied arts and sciences in the modern age. Lorenzo Ghiberti described it as “a part of perspective pertaining to painting,” Piero della Francesca called it *prospettiva pingendi* (painting perspective), Jean Pelerin *perspectiva artificialis* (artificial perspective),

and Daniele Barbaro *perspectiva pratica* (practical perspective): all these definitions converge on the basic concept of the practical application of optical laws to pictorial representation of the visible world.

Heritage and Rupture with the Tradition

Optiké: Optics in the Ancient World

In the ancient world, the theory of vision was debated mainly between two schools of thought: Democritus's atomistic theory, holding that vision resulted from the imprinting on the eye of images emanating from bodies (*èidola*), and the Pythagorean mathematical theory, which maintained on the contrary that a focus emitted from the eye under the form of rays went out to strike the surface of objects (Lindberg 1976, pp. 1–17; Ronchi 1983; Wilde 1990). A third hypothesis, postulated by Empedocles and Plato (*Timaeus*, 45b–c, 67e–68b; *Theaetetus*, 156 d–e), attributed the phenomenon of vision to two flows meeting inside the eye, coming from both inside and outside of it. For Aristotle, however, no rays were emitted from the eye or from any object; instead, there was a modification of the medium interposed between the eye and the object, the diaphanous matter that is potential in the dark and active in the light (*De sensu et sensibili*, 2, 438a; *De anima*, B 418a 26–31).

In spite of Aristotle's authority, it was the concept of the emission of rays that determined developments in optics and its scientific applications, in both the "intromissive" hypothesis of the atomists and the "extromissive" concept of the Pythagorean school. As reported by Alexander of Aphrodisias in his commentary on *De sensu* (438a 25), the mathematicians of the Pythagorean school "maintained that we see by means of rays that depart from the eyes and extend as far as the objects viewed." This idea was to be concretely expressed in the geometric formulation of Euclid, who elaborated a model of vision that remained basically unchanged up to the modern era. Imagining the visual rays as extending in a straight line under the form of a cone whose vertex is in the eye and whose base is in the object (Fig. 1), Euclid

attributed to the immaterial nature of visual and light rays a measurable form that made it possible to study the relations between apparent sizes and real dimensions, thus laying the foundation for a new mathematical science called geometric optics.

In the Roman world of the first century BC, these two main theories of vision were sustained by the greatest commentators on Greek philosophy: Lucretius and Cicero. In his *De rerum natura* (IV.46–89), Lucretius embraced the atomist doctrine, stating that images – which he called "membranes" or "rinds" – penetrate into our eyes after having been detached from bodies, whose shapes and color they retain. Cicero, on the contrary, sustained the validity of the mathematical hypothesis of rays emitted by the eye (*Letters to Atticus*, II.3.2) and believed that things appear other than what they really are, basically subordinating the perception of objects to the judgment of the eye (*Academics*, II.7.19). Cicero's considerations had a precise theoretical basis in the classification of the sciences elaborated by Geminus – like him, a pupil of Posidonius – which included among the sections on optics the so-called *skenographia*, a discipline that governed the application of the laws of vision to architecture and the figurative arts (Fig. 2).

Perspectiva Naturalis: Optics in the Middle Ages

The ancient world's knowledge of optics was assimilated in the Latin Middle Ages through the mediation of Islamic science, which proposed an original and critical interpretation of Euclidean optics. Through the Arab translators, the Latin Middle Ages discovered the founding texts of modern scientific thought, such as Euclid's *Elements* and *Optics* and Ptolemy's *Almagest* and *Optics* (Smith 1999). Euclid's *Optics* survived in both the Greek version, often confused with Theon of Alexandria's *Commentary* (fourth century), and the Arab version, the basis for the subsequent Latin translations. Fundamentally important for the resumption of optical studies, starting from the tenth century, was the acquisition of new anatomical knowledge resulting from the development of Arab medicine. And the fruitful combination of

**Perspective in

Pl. 3: the optical cone

optical knowledge and epistemological doctrines, notably those of Avicenna and Averroes, with the most advanced achievements of geometric optics, resulted in a theory of vision formulated by Alhazen (965–1039) that remained a fixed reference point throughout the Middle Ages.

Up to the development of modern optics, Alhazen was famous for his doctrine of vision as the phenomenon of refraction of light rays inside the eye. In the *Kitāb al-Manāzīr* (Book of optics), or *De aspectibus* in the Latin translation, Alhazen devoted the first book entirely to description of the eye (Fig. 3), explaining that, in the visual organ,

all the rays but one deviate through refraction; the central one, instead, proceeds in a straight line, bringing with it a distinct image of things (Alhazen 1572, II.8, 1989, 2001).

The pyramidal arrangement of the rays is thought to have allowed two types of vision, always interconnected: the one called *aspectus*, generated by all the rays in the pyramid, and the one identified as *intuitio*, more distinct and certain, generated only by the central visual ray (Alhazen 1572, II.65). Vision “by intuition” was at the same time a sensitive and rational act, revealing the qualitative and quantitative aspects

Perspective in Renaissance Philosophy,

 application of the laws of
 vision to architecture

of all things, that is, color, form, and size. This rational comprehension passed through mathematical reasoning that utilized the central ray of the visual pyramid to calculate the distances of things. Alhazen's work was translated into Latin in the twelfth century, perhaps by Gerard of Cremona, and its dissemination was crucial to the resumption of optical studies in the thirteenth and fourteenth centuries. Witelo (1230–1279) wrote a paraphrase of it for William of Moerbeke, who had translated Hero's *Catoptrics*. An anonymous Venetian translated it into the vernacular already in the late fourteenth century (Federici Vescovini 1965a, pp. 17–49). And in 1572, it came out in print, along with Witelo's *Perspectiva*, in the Latin edition edited by

Frederic Risner (Fig. 4). The hypothesis that images were formed in the crystalline lens through the intromission of light and deviation of its rays inspired a number of studies in the thirteenth century that sanctioned the birth of *perspectiva* as a philosophical science in the Latin world.

In the humanist classification of the arts, *perspectiva* was a discipline ranking lower than the so-called arts of the *quadrivium*: arithmetic, geometry, music, and astronomy. Its purpose was that of studying the phenomenon of vision as a physical fact, from both the geometric and epistemological points of view. These theoretical issues were developed primarily by the doctors of Oxford (Raynaud 1998): the Bishop of Lincoln,

**Perspective in
Renaissance Philosophy,**

Fig. 3 Alhazen (Abū ‘Alī al-Ḥasan ibn al-Ḥasan ibn al-Haytham), *Opticae Thesaurus*, Basel 1572, Book I, chap. iv: the anatomical structure of the eye

Robert Grosseteste (1168–1253), and the Franciscans Roger Bacon (1214–1294) and John Peckham (1230–1292). Peckham’s *Perspectiva communis* (General Optics), in particular, was very widely known throughout the sixteenth century, when it was published in print in a Latin edition and an Italian translation by Giovanni Paolo Gallucci. This famous treatise was composed while Peckham was engaged as a lecturer at the Apostolic Palace at Viterbo from 1277 to 1279, in the same place, then, and almost during the same years in which Witelo composed his equally famous *Perspectiva*.

Alhazen’s psychological-perceptive interpretation, which added knowledge of distance to knowledge of the optic angle (Euclid) as a necessary condition for determining the size of things, was consolidated by Witelo and the other *perspectivi* to the point of definitively sanctioning the field of action of vision as a perceptible, rational act. Seeing came to assume two meanings: “feeling with sight,” when it is only a perceptible appearance, and “discerning through sight,” when it is a rational act in which the intellect distinguishes sizes and distances as they appear (Federici Vescovini 1965b, pp. 223–237).

**Perspective in
Renaissance Philosophy,**

Fig. 4 Alhazen (Abū 'Alī al-Ḥasan ibn al-Ḥasan ibn al-Haytham), *Opticae thesaurus*, Basel 1572, frontispiece

These subjects were central to the theorizing about perspective of Biagio Pelacani from Parma, who in the late fourteenth century masterfully took up the heritage of Alhazen. In the *Quaestiones perspectivae* (Questions on optics), as in his commentaries on *De anima* and *Meteora*, Pelacani declared that vision did not perceive substantial forms or pure light, as was believed in the Neoplatonic tradition, but rather corporeal forms, which could be either superficial or solid (Federici Vescovini 1960, 1965a, pp. 240–267). The former were perceived as “sizes” through measurement of their length and width. The latter were perceived as “depth,” by measuring the distance between the eye and the object.

The Euclidean proposition that established variation in sizes with variation in the optical angle was considered useful only for the perception of superficial figures. To understand forms in their corporeality, knowledge of the third dimension was also necessary, that is, the depth or distance, measured by the central axis of the visual pyramid.

Biagio Pelacani’s optical theory probably contributed to reviving interest in Alhazen’s *De aspectibus*, which, after its Latin translation by Gerard of Cremona and Witelo’s paraphrase, was translated into the vernacular in the fourteenth century (see above) for a public that must have been broader and more diversified than that of the

university. This vernacular version was utilized, for instance, by Lorenzo Ghiberti in compiling his third *Commentary* (Federici Vescovini 1980, II, pp. 349–387). The scientific works translated into the vernacular up to that time had been mainly arithmetical and geometrical texts, which were commonly used for teaching purposes in the abacus schools. For example, Euclid’s *Elements* and Leonardo Fibonacci’s *Liber abaci* (Abacus book) were translated or compiled in the vernacular. We know, however, that in the abacus schools, *perspectiva* was also a subject of interest, and one abacus master in particular, the Augustinian Grazia de’ Castellani, is known to us for having composed a treatise on optics, *De visu*, of which an abstract devoted to measurement by sight remains (Arrighi 1967, 1968). It is probable that the reason for translating *De aspectibus* into Italian had to do with interests cultivated by the abacus masters, who in their schools experimented on the practical level with the “certified” principle of vision, developing the ancient methods of measuring by sight that Euclid himself had set out among the theorems of his *Optics* (Fig. 5).

Innovative and Original Aspects

Perspectiva Artificialis: The Invention of Linear Perspective

In the late fourteenth and early fifteenth centuries, *perspectiva*, or perspective, was explored in Florence on the highest levels. It was studied as the science of vision, thanks to the presence in the Studio Fiorentino (University of Florence) of Biagio Pelacani. It was treated as a geometric discipline for measuring by sight, thanks to the abacus masters who served as a bridge between philosophical speculation and the practical applications of optical science; and it began to be discussed as a technique of representation, thanks to experimentation in painting conducted by the school of Giotto.

Filippo Brunelleschi

Filippo Brunelleschi (1377–1446) was the first artist to earn the epithet of *perspettivo*, usually reserved for philosophers. He was called “perspectivo” by the Italian poet Ser Domenico da Prato in 1413, presumably because of the fame of the experiments in perspective conducted by

Perspective in Renaissance Philosophy, Fig. 5 Johannes Stoeffler, *Elucidatio fabricae ususque astrolabii*, Mainz 1535, p. 74: measuring a tower using similar triangles

him and reported by the sources (Tanturli 1980, pp. 125–144). We do not know exactly when the two famous “panels” that traditionally mark the birth of modern perspective were invented. His biographer Antonio di Tuccio Manetti dates them to the years of Brunelleschi’s youth, around the beginning of the century; but the critics have never agreed on this matter. The “panels” were two optical devices that confronted pictorial imitation with visual reality by depicting two places emblematic of the city of Florence: the Baptistery of San Giovanni and Piazza della Signoria. The baptistery panel was designed to be observed reflected in a mirror, standing behind the painting and looking at it through a hole drilled at the main vanishing point (Fig. 6). The demonstration took place in front of the baptistery, with the panel placed a few steps inside the central door of the cathedral and turned toward the baptistery so that, by removing the mirror, the observer could also see the real building through the hole. With the mirror partially outside of the field of vision, placed at the right distance from the eye, the observer could note the perfect coincidence between the real scene and its painted image. The panel depicting Piazza della Signoria with the Loggia dei Lanzi was instead looked at directly; but, unlike an ordinary painting, it was

shaped along the top to match the upper profile of the buildings (Fig. 7). With his gaze, the observer was prompted to align the shaped border of the painting with the corresponding profile of the real scene. As in the case of the first panel, Brunelleschi could prove by this experiment that the painted image and the real one coincided perfectly from a single observation point.

We do not know why Brunelleschi actually performed these optical demonstrations; but his purpose was, it seems, to demonstrate tangibly the basic perspective principle of the distance of observation, that is, the principle of “certified” vision maintained by Alhazen and Biagio Pelacani. This would surely have entitled him to a place among the ranks of the *perspettivi*, although his was a *perspectiva pratica* (practical perspective) to be used in representing things: an art derived from the theoretical *perspectiva* described by Manetti as “a part of that science [optics], which consists in effect of explaining well and with reasons the diminution and enlargement appearing to the eyes of men in things either far away or nearby . . . of the measurement that pertains to that distance where they appear furthest away” (Manetti 1976, pp. 55–56). That experience was based on the application of a graphic rule thought to have been invented by Brunelleschi (“and he implemented, he himself – writes Manetti – what the painters today call perspective”). According to Giorgio Vasari, the first to make an explicit pronouncement on this subject, the rule consisted of drawing a perspective view “with the plane and profile and by means of intersection” (Vasari 1973, II, p. 332). Brunelleschi would thus have invented what the sixteenth-century codifiers called the “first rule of perspective” (Fig. 8), that is, the procedure through which, given the plan and elevation of any object, and having traced the visual pyramid in both projections, the perspective image could be determined with extreme precision, by intersecting the visual rays with a plane corresponding to the painter’s picture. Since this is a procedure typical of architectural drawing (projections in plane and elevation), modern critics have substantially embraced this thesis, defining Brunelleschi’s method as

Perspective in Renaissance Philosophy,
Fig. 6 Reconstruction of Brunelleschi’s first perspective panel (by F. Camerota, Museo Galileo)

Perspective in Renaissance Philosophy,

Fig. 7 Reconstruction of Brunelleschi's second perspective panel (by F. Camerota, Museo Galileo)

“legitimate construction” (Ludwig 1882; Panofsky 1927, pp. 258–330).

In reality, we do not know exactly what “Filippo’s rule” was. We can only hypothesize that its theoretical and practical basis was the principle of intersection of the visual pyramid that had already for some time been applied by the abacus masters as a method for measuring distances; a rod interposed between the eye and object could be used to measure a proportional segment of the distance or size in question. An instrument described by the abacus master Grazia de’ Castellani to measure where “the eye went with the line of sight” is entirely similar to the one illustrated later by Francesco di Giorgio Martini to show the principle of linear perspective; the geometric laws that could be applied to measure the distance of a point were the same that could be used to represent its perspective image. Brunelleschi probably had the idea of replacing the rod with a transparent plane that allowed measurement of the apparent diminution of things in relation to their distance from the eye, anticipating a concept that was later masterfully expressed by Leon Battista Alberti. In *De pictura* – the first

treatise on perspective painting, dedicated not by chance to Brunelleschi – Alberti compared the artist’s painting to “an open window through which I look at what will be painted there” (I.19) (Fig. 9). Modern perspective painting thus resulted from a geometric operation that consisted of intersecting the visual pyramid.

Leon Battista Alberti

To Alberti (1404–1472), we owe the first attempt to establish rules and principles for geometric drawing. Between 1435 and 1436, he composed two works, closely linked and addressed primarily to painters: the *Elementa picturae* (Elements of painting) and the *De pictura* (On painting). The title of the first book explicitly recalls the important treatise by Euclid, the *Elementa geometriae* (Elements of geometry), which since the Middle Ages had been the chief reference point for mathematical studies, both in the universities and in the abacus schools. During the fourteenth century, the abacus schools underwent notable development, especially in Florence, and among the pupils were youths destined to become architects, painters, goldsmiths, or sculptors. Filippo Brunelleschi

understanding of *De pictura*, where the themes dealt with, explains Alberti, “will be easily understood by the geometer. But he who is ignorant of geometry will understand neither these nor any other discussion on painting” (*De pictura*, III.53).

De pictura is more conceptual than practical. Apart from his explanations of the method for constructing a floor in perspective and for using an instrument for drawing from life – called “velo” or “intersection” – Alberti was mainly interested in defining the optical-geometric principles that govern the plane representation of three-dimensional space. The practical procedures were, in fact, already familiar to painters, and Alberti had been stimulated to write on this subject expressly by the perspective skill of artists such as Brunelleschi, Masaccio, Ghiberti, and Donatello. On the plaster underlying the *Trinity* in Santa Maria Novella, for instance, Masaccio had left incised a practical but impeccable method for drawing the perspective of a foreshortened circle within a square, while in the *Nativity* of San Martino alla Scala, Paolo Uccello had left a fine example of what is today termed “distance point construction.” What was lacking was a text allowing artists to explain the reasons for their mode of operation, an “entirely mathematical” book – stated Alberti – which would explain the abstract concepts of geometry through the language of painters. Since the painter “studies only how to counterfeit what he sees” (I.2), Alberti was concerned with explaining the manner in which

the eye perceives the reality around it, how the lines of sight measure sizes “almost like a pair of compasses” (I.5–6), how the Euclidean theory of similar triangles explains the relationship between real and apparent size (I.14), how in order to construct similar triangles it is necessary to cut the lines of sight (I.13), and how, in the final analysis, “painting is none other than the intersection of the visual pyramid” (I.12).

The way in which these concepts could be usefully transformed into a method of representation is explained by Alberti through a procedure that critics have always interpreted as an abridged form of the more laborious construction attributed to Brunelleschi (Fig. 10). Basically, Alberti developed a method through which perspective could be drawn directly on the painting, thus avoiding the long architects’ procedure that called for the use of preliminary drawings in plan and elevation. With Alberti’s method, the principle of intersection of the visual pyramid could be applied to the construction of the flooring alone, which, being conceived as a modular grid, furnished the measurements for all of the objects appearing within the depth of the perspective field.

The Florentine Workshops

The lesson taught by Alberti was immediately adopted and transmitted by some of the artists in contact with him: Antonio Averlino, known as Filarete, for example, who in his *Trattato di architettura* (Treatise on architecture) presented

Perspective in Renaissance Philosophy,

Perspective in Renaissance Philosophy,

Fig. 11 Giuliano and Benedetto da Maiano, detail of the Studiolo of Federico da Montefeltro in Urbino, Ducal Palace

precepts and rules taken from *De pictura* and *Elementa picturae*, and Lorenzo Ghiberti, who in his *Commentaries* clearly expressed his desire to play the role of the “erudite” artist called for by Alberti. The subject of perspective is dealt with by Ghiberti in his *Third commentary*, which in the form that survives to our day is a collection of passages taken from texts on optics by medieval philosophers. The work, however, remained unfinished; and it is probable that, after having instructed artists on the science of vision, Ghiberti intended to explain the rules of the art in which the great masters of antiquity excelled, that is “that part of perspective [i.e., optics] pertaining to the art of painting.”

In the Florentine art workshops, perspective was practiced with great skill, in both painting and sculpture. Donatello had invented a new bas-relief technique, called *stiacciato* (flattened), expressly for the representation of space in perspective. Paolo Uccello was famous for the long studies on perspective he conducted for his paintings. And one category of artist, that of wooden inlayers, earned the specific title of “masters of perspective” precisely for the superb skill they displayed in creating complex perspective

compositions. One of the masterpieces of this Renaissance perspective *tarsia*, the panels of Federico da Montefeltro’s Studiolo in Urbino (Fig. 11), was produced by the Florentine workshop of the brothers Giuliano and Benedetto da Maiano. And it was just at the time that the famous Studiolo was being built (1475–1476) that Piero della Francesca composed at the court of Urbino the first true manual of perspective drawing: *De prospectiva pingendi* (On perspective for painting).

Piero della Francesca

An exceptionally refined painter and mathematician, Piero della Francesca (c. 1416–1492), accompanied his famous paintings with three important mathematical texts: an abacus book, a work on Plato’s five regular bodies, and a manual of pictorial perspective. The manual marked a fundamental stage in codifying the rules of perspective. Although it remained unpublished, the treatise circulated through various manuscript copies, inspiring the later writings of Albrecht Dürer, Daniele Barbaro, and other sixteenth-century authors (Camerota et al. 2015).

Piero was the first to write specifically for artists. While Alberti was concerned with laying

the theoretical foundations of the new pictorial discipline, Piero concentrated firmly on rules for drawing. *Prospettiva* taught how to “commensurate,” that is, how to represent things at the correct size on the surface of the painting. To measure the apparent size of things and replicate them, Piero devised drawing procedures that painters could adopt depending on the complexity of the object to be represented. The first “way” (Fig. 12), applied to the representation of geometrically simple objects, consisted of drawing a foreshortened

square destined to contain the object or objects to be depicted. The front of the foreshortened square coincided with the upper side of the square in true form that contained the plane of the object. Having traced the diagonal of the square in true form and that of the foreshortened square, the procedure called for a series of operations used to transfer the points of an object from the plan in “its own form” to the “degraded” plane. The second “way” (Fig. 13) consisted of the methodical use of the plan and elevation views as in the

Perspective in Renaissance Philosophy,
Fig. 12 Piero della Francesca, *De prospectiva pingendi*, Parma, Biblioteca Palatina, MS 1576, fol. 9r

Perspective in Renaissance Philosophy,

Fig. 13 Piero della Francesca, *De prospectiva pingendi*, Parma, Biblioteca Palatina, MS 1576, fol. 41v

abovementioned procedure attributed to Brunelleschi. That procedure was necessary for a correct representation of the most complex objects such as vaults, capitals, mazzocchi (toroidal-shaped headgears), and even the human head, which Piero geometricized with meridians and parallels, almost as if it were a terrestrial globe (Fig. 14).

Leonardo da Vinci

Piero's great geometric expertise won him the title of "monarch" of the masters of perspective. This is recalled by Luca Pacioli in his *Divina proportione* (Divine proportion), reporting a compendium by him, now lost, of *De prospectiva pingendi* (*Trattato dell'architettura*, fol. 23r). Pacioli's work of dissemination contributed to circulating Piero della Francesca's among the painters of his time, in particular Leonardo da Vinci (1452–1519), who drew splendid tables of Plato's polyhedrons in perspective for Pacioli's *Divina proportione*. Leonardo, too, began to compose a treatise on perspective; but, as with his technical-scientific compositions, his writings remained sparse and fragmented. His *Libro di pittura* (Treatise on painting) is a posthumous compilation by Francesco Melzi, one of his favorite pupils, who rearranged the numerous entries scattered throughout his master's notebooks. Leonardo

had been interested in perspective since his time as an apprentice in the workshop of Verrocchio (Fig. 15); but his studies were consolidated during the first years of his stay in Milan, when he began to study Euclid and the medieval authors of optical texts, notably John Peckham and Witelo (*Codex Atlanticus*, fol. 203ra). His project for a treatise on perspective may date from the 1480s, but Leonardo undoubtedly worked on it in various stages up to his last years in France. A "discourse on perspective" copied "from one by the great Lionardo da Vinci" was purchased in France in 1542 by Benvenuto Cellini, who called it "the most beautiful that had ever been found by any other man in the world, because . . . said Leonardo found the rules, and he explained them with such great ease and order that any man who saw them was able to apply them" (Leonardo da Vinci 1995, pp. 27–28). Although the loss of this manuscript makes it impossible to verify Cellini's description, it is probable that some of the rules for foreshortening figures are the ones transcribed by Carlo Urbino da Crema in the so-called *Codex Huygens* (Fig. 16), the document most representative of Leonardo's studies on foreshortening, the proportions of the human figure, and the so-called curvilinear perspective (Panofsky 1940).

Impact and Legacy

Early Perspective Treatises

At the beginning of the sixteenth century, the artists' science began to be disseminated in

printing, which led to rapid and progressive maturation. The first printed work dates from 1505: *De artificiali perspectiva* by the Bishop of Toul, Jean Pélerin (Viator), who described the methodical use of the so-called tiers point, two lateral

Perspective in Renaissance Philosophy, Fig. 15 Leonardo da Vinci, *Annunciazione*, 1472–1475, Florence, Galleria degli Uffizi

points similar to those used in architecture to draw the curve of a pointed arch. The “third point” was to be more appropriately termed the “distance point” only in the writings of the great codifiers of the sixteenth century.

Albrecht Dürer

When the fully illustrated booklet of Viator came out, the German painter Albrecht Dürer (1471–1528) started the geometrical studies that led him to compose one of the most successful manuals on geometric drawing ever written, the *Underweysung der Messung mit dem Zirkel und Richtscheyt, in Linien, Ebenen, und ganzen Corporen* (Instructions for measuring with compass and rule, in lines, planes and whole bodies), first published in Nuremberg in 1525. The book was intended to educate young German painters in the secrets of the art “rediscovered by the Italians” (Dürer 1525, dedication): those secrets that he had learned in Bologna, from an unknown master, in 1506. Dürer stayed in Bologna for only 8 days. On returning to Venice, where he had been living for nearly a year, he bought the very recent Latin translation of the works of Euclid edited by Bartolomeo Zamberti (1505) and began the studies in geometry that would lead him to compile the *Underweysung der Messung*. The treatise was designed to furnish the necessary geometrical

instructions not only to painters but also to “goldsmiths, sculptors, stonemasons, woodworkers, and others who base their art on the correctness of drawing.” The themes dealt with range from conic sections to the drawing of letters, from the proportioning of architectural elements to the design of sundials, and from measuring techniques to perspective drawing. Each subject is illustrated with drawings of exemplary clarity, which made a decisive contribution to the dissemination of the orthogonal projections (plan, elevation, and section or lateral elevation). The potential value of those drawings, above all to architecture, is fully demonstrated by the refined illustrations in the subsequent treatise on fortifications, published in 1527: *Etliche underricht, zu befestigung der Stett, Schloss, und Flecken* (Various instructions for the fortification of cities, castles and strongholds).

The most extraordinary applications of orthogonal projection are found in Dürer’s treatise, published posthumously in 1528, on the proportions of the human body: *Hieirin sind begriffen vier Bücher von menschlicher Proportion* (Four books on the proportions of the human figure). Here his refinement is expressed through a series of multiple projections conceived to provide geometric control even over the various positions of the human body (Fig. 17). Piero della Francesca’s

Perspective in Renaissance Philosophy, Fig. 16 Carlo Urbino, *Codex Huygens*, New York, Pierpont Morgan Library, MS M.A. 1139, fol. 111

attempt to demonstrate that it was possible to geometricize even a geometrically undefined body such as the human head was developed by Dürer into a methodical system, subjecting the infinite variations of nature to the control of geometry. In these drawings appear orthogonal projections of bodies not only in frontal but also in oblique view, seen from below or above: skillful stereometries of human torsos, limbs, and heads. Educated in a family of goldsmiths, Dürer

possessed the expertise to dominate almost entirely the field of geometric constructions; but he himself stated that this type of drawing originated in a precise professional context, that of the stonemasons (Dürer 1528, dedication to Willibald Pirchheimer).

Dürer's *Underweysung der Messung* concluded with descriptions of the rules of perspective and an instrument for drawing from life which expressed the concept that the perspective

Perspective in Renaissance Philosophy,

Fig. 17 Albrecht Dürer, *De symmetria partium in rectis formis humanorum corporum: libri in latino conversi*, Nuremberg 1532, fol. 121v

position of a point could be measured by two coordinates, just as was done by cartographers in defining the topographic position of a place. The “small door” (Fig. 18), as the instrument was called by Dürer (“türlein”), represents a constant reference point in the literature on perspective of the sixteenth and seventeenth centuries. Egnazio Danti cited it in his commentaries on Vignola’s perspective treatise (see section “[Egnazio Danti and Giacomo Barozzi da Vignola](#)”) expressly to explain “what the foundation of perspective consists of,” since with it “we will see distinctly both the visual cone and the plane that cuts it.” The line of sight is, in fact, visualized by a thread tied to a nail which serves as an eye. The point at which this thread traverses the frame, which marks the pictorial surface, is identified by two orthogonal threads that measure its “longitude” and “latitude.” The intersection of the threads is then transferred on to the drawing sheet once the “small door” has been closed.

The success of the treatise when it was published – two editions in German and no less than four in Latin over a span of 30 years – produced the effect intended by Dürer. Artists, technicians, and mathematicians in the German area paid due attention to the rules of representation, producing, in turn, little manuals of practical use and, at times, beautiful art books consisting of collections of extraordinary perspective compositions. Outstanding among these books, known as *Kunstbüchlein*, is the *Perspectiva* by the Nuremberg goldsmith Wenzel Jamnitzer, with a text of only three pages and a series of splendid copper etchings depicting complex compositions of regular and irregular bodies, perfectly drawn in perspective (Fig. 19).

Sebastiano Serlio

The European dissemination of Dürer’s treatise was ensured mainly by Joachim Camerarius’s

Perspective in Renaissance Philosophy, Fig. 18 Albrecht Dürer, *Underweysung der Messung*, Nuremberg 1525, Book IV: the “türlein” (small door)

Perspective in Renaissance Philosophy, Fig. 19 Wenzel Jamnitzer, *Perpsectiva corporum regularium*, Nuremberg 1568

Latin translation, published in Paris in 1532 under the title *Institutiones geometricae* (Geometrical instructions). It was constantly referred to by later treatise writers, starting with Sebastiano

Serlio (1475–1554), who in 1545 published in Paris the first and second of his *Sette libri di architettura* (Seven books on architecture). The two books were dedicated to geometry and to

perspective and were the fruit of knowledge acquired through contact with two of the most refined perspective artists of the time, Girolamo Genga and Baldassarre Peruzzi. Undoubtedly deriving from their teachings as consummate set designers is the importance given to theatrical scenography as the perspective art *par excellence*, a decisive aspect that explicitly placed perspective among the themes of Vitruvian studies (Fig. 20). The construction of stage settings was

contemplated in Vitruvius's *De architectura* as an art dependent on the laws of *scaenographia*, which in its most common Renaissance interpretation was synonymous with *prospettiva*. The authority of Vitruvius legitimated the decision to include the treatise on perspective among books on architecture, leading Serlio to consider as inseparable the skills of the architect and those of the perspective artist: "Perspective will do nothing without architecture, nor architecture

Perspective in Renaissance Philosophy,
Fig. 20 Sebastiano Serlio,
Il secondo libro. Di
Perspettiva, Paris, 1545, II,
 p. 67: comic scene

without perspective” (Serlio 1545, *Secondo libro*, fol. 25v).

Scaenographia: Perspective in the Vitruvian Tradition

Serlio’s *Secondo libro* posed for the first time, in a treatise of this kind, the problem of identifying perspective with Vitruvius’s *scaenographia*, inspiring the subsequent and more profound reflections of Daniele Barbaro, who published in Venice in 1568 one of the sixteenth century’s most important treatises on perspective, *La pratica della perspettiva* (Practical perspective).

Daniele Barbaro

The idea of writing this treatise came to the mind of Daniele Barbaro (1514–1570) while he was working on the first edition of *I dieci libri dell’architettura di M. Vitruvio* (Vitruvius’s Ten books on architecture), published in Venice in 1556. His purpose was to fill a gap in Vitruvius’s

text concerning the techniques required to construct the theatrical scenes mentioned in Chapter VIII of the fifth book. Vitruvius had limited himself to describing the typology of the scenes according to the different nature of tragedy, comedy, and satirical drama (Fig. 21); but modern commentators turn to that chapter to indicate the field of application of the third type of *dispositio*: *scaenographia*. In his commentary on that chapter, Barbaro announced that he was compiling a treatise on perspective in five books dealing with geometric principles, with the drawing of plane figures (what Vitruvius called *ichnographia*), the drawing of solids (*orthographia*), the perspective representation of buildings (*scaenographia*), and various other perspective themes, such as the projection of shadows (derived from Dürer), the description of instruments for drawing from life, and the anamorphic deformation of images already anticipated by Piero della Francesca. Piero’s treatise was, in fact, one of the sources

Perspective in Renaissance Philosophy, Fig. 21 Daniele Barbaro, *I dieci libri dell’architettura di M. Vitruvio*, Venice 1556, Book V, chap. viii: the tragic scene as interpreted by Andrea Palladio

Perspective in Renaissance Philosophy,

Fig. 23 Sebastiano Serlio, *Tutte l'opere d'architettura ...*, Venice 1584, *Il secondo libro di prospettiva*, fol. 19v

sufficient to construct the architectural features of paintings in frontal view (Fig. 23). For the construction of theatrical scenes, instead, it was useful to have other vanishing points available, as many as were the objective directions of the straight lines and the planes. Scamozzi called them “horizontal” because they all stayed on the horizon line; later, the mathematicians Egnazio Danti and Guidobaldo del Monte called them, respectively, *punti coadiutori* (assisting points) and *punti di concorso* (converging points) (Del Monte 1600).

Artists and Mathematicians: Art Academies and the Teaching of Perspective

The contribution of mathematicians to the codifying of perspective was intensified in the second half of the sixteenth century, starting from Commandino’s abovementioned commentary on Ptolemy’s planisphere. The contribution of Giovanni Battista Benedetti in *De rationibus operationum perspectivae* (The rules of perspective operations, 1574) was not particularly influential, reaching neither the great public of artists nor that of the academies. The work of Egnazio Danti was, by contrast, decisive; it developed precisely from the direct relationship with the teaching activity conducted in the academies of art.

Egnazio Danti and Giacomo Barozzi da Vignola

In 1573 Egnazio Danti (1536–1586) published the *Prospettiva di Euclide* (Euclid’s optics), the first Italian translation of Euclid’s *Optika kai katoptrika* (Optics and catoptrics). Danti dedicated it to the “Academicians of Drawing” in Perugia, his birthplace, in the awareness that artists had been responsible for keeping interest in optical studies alive; interest, in his opinion, abated “in the schools of the philosophers” where optics had been nearly “banned” (dedication). Optical studies had, in effect, been interrupted in the late fourteenth century, and only around 1520 was the long silence broken by the first work of theoretical commitment: the *Photismi de lumine et umbra ad perspectivam et radiorum indiciem facientes* (Radiation of light and shadow, concerning perspective and the incidence of rays) by Francesco Maurolico which, however, remained unpublished until 1611. This work focused mainly on the phenomenon of refraction already discussed by Alhazen, and it explained for the first time the phenomenon of the formation of images on the retina. In the early seventeenth century, the subject was taken up again by Johannes Kepler in his “additions” to Witelo’s treatise (*Ad Vitellionem paralipomena*, 1604) and in the *Dioptrice* (1610), the two works that laid the foundations of modern geometric optics.

Among the mathematicians who worked on optics and perspective, Egnazio Danti was the one most attentive to practical applications and dissemination of this discipline in the artists' schools. His teaching of mathematics at the Academy of Drawing in Florence was decisive in this sense. It was for his students that he first translated Euclid's *Optics*, convinced that this science was necessary to philosophers, to cosmographers and to artists: to the first, for the study of natural philosophy, to the second for cartography and astronomical observations, and to the third for the ever more refined applications that were being made in architecture and in "all the other arts of drawing." To teach the rules of perspective as a drawing discipline, Danti used the treatise, still unpublished, of Giacomo Barozzi da Vignola (1507–1573), which he published years later with an ample commentary, leaving us one of the richest sources of technical, scientific, and historiographical information. *Le due regole della prospettiva pratica di M. Iacomo Barozzi da Vignola* (The two rules of practical perspective of M. Iacomo Barozzi da Vignola) was published in Rome in 1583, richly illustrated with fine copper etchings. The very clear, concise text of Vignola was alternated with the extensive technical and theoretical considerations of Egnazio Danti, identified by a smaller typographical font and illustrated by woodcuts. The two rules mentioned in the title were the method for intersecting the visual pyramid in plan and elevation and the method of construction with a distance point – rules whose most lucid and complete codification is found here (Fig. 24).

In the late sixteenth century, we observe the emergence of a professional figure who moved easily among the figurative arts and technical problems. Painting, map-making, architecture, fortifications, and the construction of machines were skills frequently found in one person, whose mathematical training was increasingly assisted by schools closely linked to the artists' workshops. In the second half of the sixteenth century, there are at least four cases in which the relationship between the arts and the mathematical sciences is clearly expressed through educational programs: two private schools at the Medici

court, directed by Ostilio Ricci and by Giulio Parigi, the Florentine Accademia delle Arti del Disegno, an art academy, and the Paduan Accademia Delia, a military academy. Ostilio Ricci, the master of Galileo, taught geometry and perspective at the home of Bernardo Buontalenti, where some of the pupils were his young apprentices, including Ludovico Cigoli, Don Giovanni de' Medici, and probably Giulio Parigi, who, in 1603, became "Mathematician to the Pages," a position entrusted for the first time to an artist. Following the example of Ostilio Ricci, Parigi opened a private school frequented by youths from the Medici family and the Florentine nobility. According to Filippo Baldinucci, who called this school an "academy," Parigi:

read Euclid, taught mechanics, perspective, civil and military architecture and a fine new way of drawing most admirable landscapes. This academy was not only frequented by his own sons . . . and by all of the Florentine nobility, but was already so famous throughout Europe that princes and great knights from Italy and abroad came purposely for it, and stayed in our city, to learn there those noble sciences and disciplines. (Baldinucci 1975, IV, p. 141)

The schools of Ostilio Ricci and Giulio Parigi represent a symptomatic evolution of the Renaissance artists' workshop toward the model represented by the Accademia del Disegno, where the teaching of mathematics became the necessary component that welded the figurative arts to the geometric disciplines. The "men of drawing, that is, architects, sculptors, painters, etc." were asked to broaden their technical and scientific knowledge by studying anatomy, mathematics, mechanics, architecture, hydraulic engineering, perspective, music, and Euclidean geometry.

Lodovico Cigoli

Two of the most important treatises of the early seventeenth century were addressed to the "men of drawing": the *Prospettiva pratica* by the painter Lodovico Cardi Cigoli (1559–1613) and *Lo inganno degli occhi* (The deception of the eyes) by the mathematician Pietro Accolti. Remaining unpublished due to the untimely death of its author in 1613, Cigoli's treatise is outstanding

Perspective in Renaissance Philosophy, Fig. 24 Jacopo Barozzi da Vignola, *Le due regole della prospettiva pratica*, Rome 1583: first and second rules of perspective

for the clarity and completeness of the subjects treated. Especially noteworthy are the sections on geometric drawing (orthographic projections), on the rules of perspective (the first and second rule, and the method with convergence points), on stage set design (the geometry for creating theatrical illusions, Fig. 25), and the final section on

instruments for drawing from life, which takes account of the importance attributed to the mechanical representation of nature in the Florentine milieu. Not by chance, Cigoli was one of the artists most interested in using the telescope as a perspective tool. To him, we owe some of the most methodical perspective views of sunspots,

Perspective in Renaissance Philosophy,
Fig. 25 Lodovico Cardi Cigoli, *Prospettiva pratica*, c. 1610, Firenze, Uffizi Gallery, Gabinetto dei Disegni e delle Stampe, 2660 A, fol. 64r: perspective construction of a building for a stage set design

specially done to back up the observations carried out by his friend Galileo in 1612. And to him, we also owe the first telescopic portrait of the moon still visible under the feet of the Virgin in the fresco of the Cappella Paolina in Santa Maria Maggiore (Fig. 26).

The Perspective of Shadows

Cigoli's interest in the telescope as a perspective tool was not an isolated case. Already in the late

sixteenth century, a "perspective tube" for terrestrial use had interested several English mathematicians for its applications to topography and landscape painting (Van Helden 1977). Kepler had further developed the Galilean telescope for surveying purposes, equipping it with a third lens and a drawing table to be used in a *camera obscura*; and Galileo himself realized that the best way to describe and measure the new celestial world was that of drawing what he saw through

Perspective in Renaissance Philosophy,
Fig. 26 Lodovico Cardi Cigoli, *Immacolata concezione*, affresco, 1612, Rome, Santa Maria Maggiore, dome of the Cappella Paolina: the moon as seen through the telescope

the lenses, using the telescope as a painter would have used a perspective instrument.

The spread of the telescope had renewed scientific interest in the problems of optics and perspective. In the years immediately after Galileo's first observations (1609), Kepler's *Dioptrice*, Maurolico's *Photismi*, and the *Opticorum libri sex* (Six books on optics) by the Jesuit François d'Auguillon were published. The latter was a weighty treatise on optics illustrated by Peter Paul Rubens, which examined the science of vision in its manifold aspects, physiological, psychological, and geometric (Aguilonius 1613). Galileo's explanations of the results of his observations in the *Sidereus nuncius* were often based on perspective, viewed as both the science of vision and a technique of representation. It was for this reason that Cigoli considered Galileo his true master of perspective, turning to him even for such a strictly academic question as to the age-old debate on the superiority of the different arts.

Galileo's opinion on the superiority of painting is expressed in a famous letter to Cigoli where the scientist described painting as "the faculty that with lightness and darkness imitates nature" (Panofsky 1956, 1978, pp. 81–102). Chiaroscuro was the technique used to imitate relief, a dimension of nature that is perceived only thanks to the contrast between light and shadow. Where there is

no contrast, explained Galileo, there is no visible relief, and even a sculpture would appear as a flat surface if not appropriately lighted. To prove this point, Galileo proposed an experiment, which seems to have circulated in the academic milieu disguised as an ancient anecdote in the style of Pliny the Elder, perhaps to make it more authoritative. Pietro Accolti presented it in this way, mentioning a competition between Apelles and Praxiteles that is not registered in any ancient source. To demonstrate the superiority of his own art, according to the fabricated anecdote, Apelles is said to have transformed his rival's statue into a flat surface by painting the lighted areas dark and those in shadow light, exactly as suggested by Galileo.

Pietro Accolti

Like Galileo, Accolti (1579–1642) declared that no painted object could ever have appeared different from what it was, that is, a flat surface, without the skilled use of lights and shadows. Among his most original contributions is, in fact, the representation of shadows, including the specific case of shadows projected by sunlight.

The innovative practice of representing shadows geometrically was introduced by Dürer in the *Underweysung der Messung*, where he demonstrated the principle of projecting shadows with a point source of light: a lamp or a candle (Fig. 27). Dürer's scheme was to be proposed again, without substantial modifications, at least up to Aguilonius's *Opticorum libri sex* (1613), where we find it specified that "those things lighted by lamps ... should be expressed *scaenographicae*, that is in perspective," while those "that are exposed to the direct rays of the sun should be presented *orthographicae*, that is, in orthographic projection." Accolti concentrated on this second case, following Galileo's argument on the orographic nature of the moon. According to Galileo, the clearest proof that the moon had a mountainous surface similar to that of the earth was the craggy profile of the terminator, the line of separation between light and shadow. We do not perceive the mountain peaks in the illuminated area because there, only the lighted part could be seen. If we imagine an irregular surface lit up by

Perspective in Renaissance Philosophy,

Underweysung der
Messung, Nuremberg 1525,
 Book IV: cast shadow of
 a cube

the sun, explains Galileo, “the sun, or one who might stand in its place, absolutely would not see any of the shadowy parts, but only those that are lit up; because in this case the lines of sight and of

illumination proceed along the same straight paths.” To see the shadows, it would be necessary for “the line of sight to rise above said surface more than the solar ray,” that is, for the eye to look

Perspective in Renaissance Philosophy, Fig. 28 Pietro Accolti, *Lo inganno de gl'occhi*, Florence 1625, pp. 140–1

at the object from another point of view, as happens when we see the terminator.

With similar arguments, Accolti proposed a way of drawing the shadows cast by the solar light by comparing two different views of the same body: a hollow cube (Fig. 28). In the first view, the cube is seen by the eye of man and thus drawn in perspective, with the foreshortened sides converging toward a vanishing point. In the second view, the cube is seen by “the eye of the sun” and consequently drawn in orthographic projection, with the foreshortened sides parallel, that is, “not concurring at any point in perspective.” Since the sun is at the same time both the seeing eye and the source of light, the second cube appears free of shadows, or rather the shadows are concealed by the parts of the object which produce them. In order to see the shadows, the eye would have to be shifted to another position, as in the cube drawn in perspective, where the shadows are produced by simply transferring from the orthographic cube the points where that which lies in front is superimposed on that which

lies behind. For this reason, the orthographic drawing is called “ombrifero” or generator of shadows. Although Accolti’s objective was to describe an alternative way of representing shadows in perspective, the drawing called “ombrifero” contained all of the elements which, with Girard Desargues, were to lead to the definition of the ideal point in projective geometry. The cube appears to us as if we were looking at it from the position of the sun, that is, from a viewpoint at infinite distance.

Perspective “à la cavalière”: The Military Practice of Drawing

Accolti’s “shadowy” drawing is what we now call “axonometry,” a representation in “parallel” perspective known at that time as “soldiers’ perspective” since it was commonly used in the military field. This kind of perspective without foreshortening, widespread since antiquity, had been the perspective of mathematicians throughout the Middle Ages. In treatises on practical geometry, as in the earlier land-surveying

treatises, geometric solids were represented in precisely this manner, according to a practice that was to remain in vogue throughout the Renaissance, even among the greatest theoreticians of linear perspective. Piero della Francesca, for instance, utilized it in both his abacus book and his booklet on the five regular bodies, in order to lay emphasis on the geometric characteristics of bodies rather than on their apparent image. Leonardo employed it superbly to represent machines and mechanical elements; Dürer and Jean Cousin showed how it could be used to draw the foreshortening of a human figure; and Juan de Rojas Sarmiento used the method to draw a new kind of astrolabe where the points of the sphere were transferred on to the plane according to what Aguilonius was to call “orthographic projection.”

The need to have a drawing that was both “pictorial” and measurable had favored the dissemination of a practical, rapid system of “perspective” through which the geometric characteristics of the object represented could be retained unaltered. Girolamo Maggi, who in 1564 published the treatise *Della fortificatione delle città* (On the fortification of cities) explicitly mentions the use of this type of representation as specific to military architecture: “Let no one think to see in these drawings of mine either methods or rules for perspective, firstly because, not being a soldier’s technique, I would not know how to do it, and then because, due to the foreshortening, too much of the plan would be lost. These drawings serve instead expressly to show the plans, and this is called soldierly perspective” (Fig. 29). The drawing proposed by Maggi is what is now called “military axonometry,” retaining a term which indicates its origin or at least its predominant usage in fortified architecture. Bonaiuto Lorini calls it “the most common perspective,” Bartolomeo Romano “spherical perspective,” and Giovanni Battista Bellucci “perspective that serves for practical uses,” and again in the nineteenth century, the first codifier of this method, William Farish, was to call it “isometric perspective.” Among French soldiers and mathematicians, it took the name

“perspective à la cavalière,” where “à la cavalière” meant “informal,” “casual,” “rapid,” “without the hindrance of the geometric rules”: a simpler perspective conceived for the specific use of the military men (Ozanam 1691).

A “War” Between Artists and Mathematicians: The French Perspectivists

Although applied mainly to the problems of artists and thus consisting of practical procedures, perspective was by tradition a mathematical science. Christopher Clavius had included it in the curriculum of Jesuit schools, and its applications had been studied by some of the Society of Jesus’s illustrious mathematicians, such as Christoph Scheiner, inventor of the pantograph; Mario Bettini and Christoph Grienberger, inventors of new perspective instruments inspired by the pantograph; Athanasius Kircher and Gaspard Schott, visionary creators of magic optical tricks; and Jean Dubreuil, one of the leading figures in the heated debate that accompanied the development of projective geometry in France.

The bitter academic quarrel had been unwittingly triggered by Dubreuil himself. In his *La Perspective pratique*, a text widely disseminated and not only in Jesuit schools, he had presented, with some variants, the perspective method developed a few years before by the architect and mathematician Girard Desargues, who, between 1636 and 1640, published three important contributions on perspective (1636), on conic sections (1639), and on stereotomy (1640), proposing a radical renewal of the methods used for geometric representation. The treatise on conic sections contained the theoretical principles for a new geometry destined to become the common foundation of the arts based on the concepts of projection and section. The definitions essential to the development of this science of drawing included those required for a perfect codification of the geometry of solar shadows and the geometry of axonometry, that is, the point at infinity, called “objective,” (*but*) conceived as the meeting place of parallel lines, and the straight line at infinity, called “axes” (*essieux*), seen as the meeting place of parallel planes. For perspective drawing,

Perspective in Renaissance Philosophy, Fig. 29 Girolamo Maggi and Iacomo Castriotto, *Della fortificatione delle città ... libri III*, Venice 1583, fol. 68v

Desargues proposed the use of proportional scales, which made it possible to operate always and in any case within the painting surface

(Fig. 30). His method tended to eliminate any complication derived from the use of “convergence points,” including the particular case of

**Perspective in
Renaissance Philosophy,**
Fig. 30 Girard Desargues,
*Exemple d'une manière
universelle ... touchant la
pratique de la perspective*,
Paris 1636

the distance point, often situated outside of the painting, and so increasing the probability of error. The proportional scales should be “for the artist a tool similar to the proportional compass,” the Galilean instrument that Desargues and other French mathematicians of his time transformed

into a “compas optique ou de perspective” (Aleaume 1629; Vaulezard 1631; Migon 1643).

Desargues reacted vehemently to Dubreuil’s treatise, affixing handbills in the streets of Paris publicly accusing the Jesuit father of plagiarism and proclaiming him guilty of “unbelievable

errors” and “enormous mistakes and falsehoods.” According to Desargues, Dubreuil had failed to grasp the fine points of his *manière universelle* and had trivialized it. Dubreuil had replied to these accusations with a scornful pamphlet, *Advis charitables* (Charitable advice), and a new booklet on perspective, *Diverses methodes universelles et nouvelles* (Various new and universal methods), in which he attributed the authorship of Desargues’s *manière* to the mathematician Jacques Aleaume. In the meantime, the controversy had produced several texts on perspective by the most eminent members of the Académie Royale, fiercely attacking one another: on the one hand, Abraham Bosse, a strenuous defender of Desargues, and, on the other, Jacques Curabelle, Jacques Le Bicheur, and Grégoire Huret, who spared their opponents no insult nor personal offense.

Apart from personal malice and academic rivalry, the debate centered on the age-old question of the relationship between the principles of geometry and the practice of art. Desargues and Bosse advocated total geometric control in architectural drawing as well as in painting; but to their opponents, the use of proportional scales seemed a futile complication. Dubreuil also regarded the use of geometric rules as fundamental, since without them the painter could hope “only to paint for the ignorant”; but their application was functional to artistic practice and did not call for the rigor of a mathematical demonstration.

Anamorphosis and the Triumph of Illusion

Entirely extraneous to the academic disputes over the work of Desargues, but certainly well informed and sensitive to his innovations, was the Minim Friar Jean François Nicéron, who codified the rules of the so-called curious perspective or anamorphosis. Anamorphosis was the new frontier of studies in perspective. Introduced in the late fifteenth century by Piero della Francesca as a case of the projection of shadows (*De prospectiva pingendi*, III, X–XII), the technique had evolved over the course of the sixteenth century without any clear codification of its geometric

rules. Nicéron first investigated all possible declinations, expressing in geometric terms some philosophical questions on visual appearance already discussed in the *Dioptrique* of René Descartes. Behind the spectacular nature of the “anamorphic magic” lay a rigorous scientific concept that investigated the most complex themes of geometric optics and taught methods for deforming and regenerating images viewed either directly or using mirrors and lenses. The *Perspective curieuse* was published in Paris in 1638 and, quite extended, in Latin, in 1646 under the title *Thaumaturgus opticus*. This second, posthumously published, edition contained major technical and theoretical innovations, including two appendices devoted to Lodovico Cigoli’s use of a perspective instrument and to the projection of shadows (Nicéron 1646, II, pp. 191–218).

Nicéron was also the author of the two spectacular pictorial applications of this perspective technique. In his Parisian monastery in Place Royale and in the Roman monastery of Trinità dei Monti, he made extraordinary anamorphic compositions of great size. Those in the Roman monastery, accomplished in collaboration with his brother friar Emmanuel Maignan in 1642, are the only ones to have survived (Fig. 31): dreamlike images that transmute under the incredulous eye of the observer into a swirl of sinuous lines floating in an imaginary space, now shapeless, now perfectly recognizable. These stupefying illusions served as inspiration to the most virtuoso of the quadraturists, the Jesuit Andrea Pozzo, who imposed the same illusory mechanism on architectural space. Like the anamorphoses, his painted architecture was based on the adoption of a single viewing point, rejecting the multiplicity of points favored by the quadraturists of the sixteenth and seventeenth centuries.

The illusory power of his fictive architecture was so strong that it forcefully conditioned the perception of space, leading neoclassical critics to censor his paintings as if they were actually buildings. On the technical level, the supreme skill of the Jesuit painter was undeniable. On both the theoretical and the practical level, the

Perspective in Renaissance Philosophy, Fig. 31 Emmanuel Maignan, *Anamorphic image of St. Francis of Paola*, mural painting, 1644, Rome, Trinità dei Monti

meticulous exactitude of Andrea Pozzo was impeccable. The didactic structure of his treatise, *Perspectiva pictorum et architectorum* (Perspective for painters and architects, 1693), leading the reader to tackle a problem only after having thoroughly understood the one before it, is perfectly confirmed by the methodical conduction of his worksite, recognizable today by some meaningful signs. On the ceiling of the Jesuit church of Sant'Ignazio, in Rome (Fig. 32), for instance, the traces of the construction grid cut into the plaster reveal the utmost degree of precision in transferring the measurements of the sketch to the great dimensions of the pictorial surface. On the construction site, as in the treatise, each step is accurately measured, and in this absolute precision lies the secret of the amazing illusionistic effects achieved by Pozzo.

With a rigor matching his technical skill, Pozzo sets out the two basic rules of practical perspective, “distance point” and “intersection,” explaining how to evade the pitfalls of geometric drawing on highly foreshortened planes (Fig. 33).

With the same inflexible rigor, Pozzo rejects any mitigation of perspectival deformation, such as the use of several vanishing points preferred by the great quadraturists of Emilia and the Veneto, firmly imposing his faith in the single vanishing point that will provide maximum illusion and assigning an important added value to marginal deformations. Pozzo devoted the concluding appendix of his treatise, entitled *Risposta sull'obiezione fatta circa il punto di vista nelle prospettive* (An answer to the objection made about the point of sight in perspective), to this crucial subject, which he set out in three simple and categorical arguments: first, “the greatest masters” have always used a single viewpoint; second, “since perspective is but a counterfeiting of the truth,” the painter is not obliged to show it correctly from all points of view, but from only one; third, if a work is made to be seen from several viewpoints, none of them will the illusion be truly convincing. The glorious fresco over the nave in Sant'Ignazio is cited as proof of these statements, and the marble disk in that church

Perspective in Renaissance Philosophy, Fig. 32 Reconstruction of the grid traced on the plaster of the ceiling in the church of St. Ignatius, Rome

Perspective in Renaissance Philosophy, Fig. 33 Andrea Pozzo, *Perspectiva pictorum et architectorum*, Rome 1693, Pl. 92: perspective construction of a fake cupola on a flat ceiling

that unmistakably marks the position of the observation point has the unarguable tone of a geometric theorem, whose demonstration is renewed again each time to the astonished eyes of the observer. That marble disk is perhaps the most eloquent and emblematic image of the central nature of the gaze in the conception of pictorial and architectural space proper to the modern age.

Peter of Candia

Born: ca. 1340, Crete

Died: 3 May 1410, Bologna

Chris Schabel

Department of History and Archaeology,
University of Cyprus, Nicosia, Cyprus

Abstract

The Greek Franciscan Peter of Candia (c. 1340–1410) was a towering figure in intellectual and ecclesiastical affairs during the

Great Schism. His education and early teaching took him all over Europe until he began lecturing on the *Sentences* at Paris just as the Schism began. Afterward, he was active in northern Italy in the service of the future Duke of Milan and as a prelate, rising to archbishop of Milan and cardinal. He was also associated with leading humanists and the Palaiologan dynasty. Joining the conciliar movement, he was elected Pope Alexander V at the Council of Pisa in 1409, but he died the following year. His election no doubt helped make his main writing, his questions on the *Sentences*, a best seller in his day.

Alternate Names

Filargis, Petros; Filargis, Petrus; Philargis, Petros; Philargis, Petrus; Philargo; Philargus; Philaretus; Cretensis

Biography

Peter of Candia (present-day Herakleion) was born to Greek parents on Crete c. 1340, during the island's long period of Venetian rule (1211–1669). Peter was orphaned during the Black Death and raised by local Franciscans, who recognized his intelligence. Around 1357 Peter joined the order and embarked on a career reflecting the Franciscan school network, studying at Minorite *studia* in Padua, Norwich, Oxford, and, in the mid-1360s, probably Paris. He was then sent to teach in convents in Russia, Bohemia, and Poland. His superiors rewarded him by assigning him to lecture on the *Sentences* at Paris as Bachelor of Theology, which he did in the 1378–1379 academic year. Peter began with his first *principium* on September 24, 1378, 4 days after the outbreak of the Great Schism. He was licensed at the end of 1381 and incepted as Master of Theology in early 1382.

By 1384, Peter had moved to Italy, where he helped develop the University of Pavia. There Peter joined Giangaleazzo Visconti's service. Recognized as the most illustrious member of a court that included such great intellectual figures as

Baldus de Ubaldis and Manuel Chrysoloras, Peter became deeply involved in humanist circles, associating closely with Umberto Decembrio, Pier Candido Decembrio, and Coluccio Salutati. Peter's principal sermons delivered before his lectures on each book of the *Sentences* already revealed that he was a master Latinist, but he did not forget his Greek. Considering Plato and Aristotle his compatriots, Peter retained links to the Palaiologans in Constantinople and the Morea and translated some of St. Jerome into Greek. Thus, he represents an early bridge between the Latin and Greek phases of the Italian Renaissance.

In late 1386, Pope Urban VI appointed Peter bishop of Piacenza. He was then transferred to Vicenza (early 1388) and Novara (mid-1389). Still active as Giangaleazzo's emissary on various missions, Peter obtained for his master the title "Duke of Milan" from Emperor Wenceslas in 1394, and when the see became vacant, Peter was made archbishop of Milan on May 17, 1402. The Duke died 4 months later, but Peter continued his professional ascent: in 1405, the Roman Pope Innocent VII named Peter cardinal-priest of the Church of the Twelve Apostles. When the rival popes refused to take steps to end the Great Schism, Peter joined the conciliar movement, giving the sermon to open the Council of Pisa on March 26, 1409. The council deposed Popes Gregory XII and Benedict XIII and, on June 26, elected Peter of Candia pope as Alexander V, the only Greek pope after the eighth century. The election effectively produced three popes, although Alexander won the support of most of Catholic Christendom. Unfortunately, for Alexander and his legacy, his eventful papacy lasted only 10 months, and he died in Bologna on May 3, 1410. Thus, the Schism continued, and much later Alexander V was labeled an "antipope."

Peter of Candia's philosophical writings include the logic treatises *De consequentiis*, published by Maria Bertagna, and *De obligationibus*, edited but not yet published by Stephen F. Brown. Peter also wrote the theological tract *De divinis nominibus*, printed in early modern editions of Francis of Meyronnes' works. Peter's most important work is his questions on the *Sentences* of Peter Lombard, parts of which survive in at least 50 manuscripts,

making it one of the most popular specimens of the genre in the latter half of the fourteenth century. The work's greatest merit is that it serves as a virtual history of fourteenth-century thought on a variety of issues. Peter was so gifted at this that, concerning his portrayal of Peter Auriol's doctrine of divine foreknowledge, in 1470 Peter de Rivo would remark that "Peter of Candia explained his opinion with clearer words" than had Auriol himself. Not only would Peter survey these earlier opinions; he would usually give a succinct abstract afterward, summarizing his survey by beginning like this: "Therefore this doctor's view, as I see it, consists in the following...." Because of Peter's objectivity, his abstracts are a wonderful tool for understanding fourteenth-century philosophical thought. The following statement is a characteristic of his unbiased approach, in this case concerning a position of Auriol: "I don't care whether it's true or not, because right now I am not reciting it to adhere to it, but just to explicate the truth of what will be said later." Thus, the opening question to Peter's prologue to the *Sentences* has been aptly called his "Hundred Year 'History' of the Theologian's Role."

Peter of Candia also offers an independent appraisal of earlier scholars' theories, criticizing and approving where he thinks best, often with a touch of humor. For example: "But although these things appear beautifully said, they generate no melody in Ockham's ears." Again concerning Ockham: "Although one can maintain this position, because it would be hard to disprove it, in truth, if one pays close attention, it does not fish as deeply as the previous two." In another context: "I once heard this response from Master William of Cremona, when he was lecturing on the *Sentences*, but with all due respect, he did not then have the mind of a doctor." Peter often speaks "with all due respect" and sometimes "for the sake of argument." When Peter saw that what he was saying on the issue of the univocity of being was contradictory to what he had said before, he quipped: "I upheld this position in my second *principium*, against Master Gerard Calcar, and now I am holding the opposite here – not that I consider one position to be truer than the other, but in order to illustrate several ways of conceiving the problem, for the pleasure of those

who sometimes want to eat bread and sometimes cheese.” On divine foreknowledge of future contingents, Peter presents objectively and at length several opinions, but he finds them all wanting ends by declaring: “I, like a little dog, have started the hare for you. Capture it through whatever path of the aforesaid ways you wish.”

Given the nature of Peter of Candia’s major writing, perhaps it is best to finish in his own words: “But because I have written enough, and visibly, I believe the school has been oppressed enough with listening to me, I will refrain.” Or better, Peter’s last words in his entire work: “I was prepared to make a long discussion of this material, but God wants me to rest from my labors.”

Abstract

Petrarch is the poet who above all perfected the original Vulgar Italian tongue, developing its melodious elegance and thus providing a model of verse composition for later writers, both Italian and European. He embodied the original modern intellectual, ready to travel the “world” for his work, eager to meet new colleagues for professional and cultural exchanges, and determined to conduct field research as he uncovered lost texts from the classical tradition. Petrarch’s contribution to the literary and more generally intellectual world is priceless. He was completely devoted to culture in a more practical sense, unearthing a number of important manuscripts and laying the foundations for a new concept of the public library, promoting the dissemination of information after centuries of oblivion. Petrarch also pioneered the genre of intimate and personal dialogue with past authors, addressing them in letters (*Epistolae*) and in the *Secretum*, his own personal “diary,” constructing a cultural continuum based on the transmission of knowledge. His literary works, both in Latin and in Vulgar Italian, are still considered among the most influential in the late Middle Ages, especially as an inspiration for Renaissance Humanism, not only for their

style but also for their adaptation of classical poems and philosophical treatises.

For Petrarch's biography, we have much more evidence than for contemporaries such as Dante or Boccaccio, in no small measure, because he wanted to devote more time to his studies in order to skirt the political and religious controversies of his times. His work in Law, in tandem with his renowned cultural background, enabled him to serve as Counselor to a number of important figures of State and Church, but he always managed to steer clear of risky professional associations, so that he could apply himself to his writing.

His method of writing poems gave rise to "Petrarchism," defined as the formal poetic style introduced by Petrarch. But this is not merely a literary expression that aims to evoke the themes, images, and stylistic figures of his poetry; it is also a way of life, both intellectual and spiritual.

Biography

The Trecento is a century that saw the emergence of several European states with dynastic conflicts opposing, for example, France to England, which brought the Hundred Years' War (1337–1453), while in Italy, the Signoria replaced the Commune. In north-central Italy, the Communes which became Signorie transformed in regional states: the most important were Milan, Venice, and Florence. In central Italy, the Church established a regional state for its territories, while the South was divided between the Kingdom of Naples, under the rule of the French, and Sicily, which was under Spanish domination.

This territorial situation brought the fourteenth century to be first of all a moment of great socio-political changes, with both an economic and demographic crisis and the plague, the Black Death in 1348, which decimated the European population. The reduction of agricultural and

artisanal production, as well as of the manufacturing industry had a negative impact on commerce, which led to social tensions and revolts among workers.

The fourteenth century also brought a crisis within the Church. During the year 1300, Pope Boniface VIII announced the first Jubilee of Christian history, which was an attempt of the pope to impose his authority on temporal power. Tensions arose particularly with King Philip IV of France and led the Holy See to be transferred to Avignon, France, under closer control of the French monarchs. It was the first time that Western Christianity tore apart in such a way and saw the coexistence of two popes: Urbano VI and Clemente VII, one in Rome and one in Avignon.

Petrarch lived through 70 years of the fourteenth century, right during the Avignon Papacy (1309–1376), in a historical context which led him to collaborate with both the Empire and the Papacy. However, he always kept firmly his political and spiritual beliefs, fighting for a righteous conduct of temporal power as well as a renewal of the Church and a return to its Roman seat.

Petrarch was born in the Tuscan town of Arezzo on July 20, 1304. He spent the first three years of his life there, before moving with his family to Carpentras in Provence, near Avignon; at the age of 16, he returned to Italy, spending the next 6 years in Bologna, until the death of his father. In 1319, his mother died at the age of 38, which corresponds to the number of hexameters in the *Breve pangeyricum defuncte matri* (*Epystole*, I, 7) that he wrote in her memory. Eletta Canigiani (1270–1319) had been born to one of the leading families of Oltrarno in Florence. In fact, both of Petrarch's parents came from White Guelph families and had thus been banished from Florence in 1302. Ser Pietro di ser Parenzo di Garzo dell'Incisa, nicknamed Petracco, (1267–1326) was a merchant, notary public, Chancellor of the Commission for Reforms in Florence, and ambassador for the State of Florence. In 1302, after the victory of the Black Party in Florence, a number of White Guelphs were banished and had their property confiscated, including Dante Alighieri as well as Petrarch's father. As a result, Petrarch would never live in the Tuscan capital, visiting only

once in 1350, since he perhaps wanted to outlive the memory of his father together with his political fate. This would leave him restless and ever on the move his entire life. He indeed never settled in one place for more than 9 months.

Petracco served out his exile in Arezzo, at the Incisa in Val d'Arno, before transferring to Pisa (where he met Dante) and then Avignon, a traditional meeting place for Guelph exiles. There he joined the mercantile company of the Frescobaldi, for whom he drafted contracts until 1310. Although he had been pardoned in February 1309, he still avoided Florence. Around 1311–1312, he brought his wife and children, Francesco and the younger Gherardo (born c. 1307), to Provence. Petrarch's brother soon afterwards became a Carthusian monk and would serve as a model for Petrarch of a practical and spiritual lifestyle. Petrarch would commemorate him in works such as the *De vita solitaria*, the *De otio religioso*, the *Secretum*, and the first Eclogue of his *Bucolicum Carmen*. Once his family was settled in Carpentras, Francesco and Gherardo began their studies under another Guelph exile, Convenevole of Prato (*Seniles*, XVI, 1), before being sent to Montpellier to continue their Law degree. After the death of his wife, Ser Pietro brought his children to Bologna in 1320 in order to study Law under Guido Sette. In these teenage years, Petrarch was more inclined towards literature and began to spend more time with the poet and Latinist Giovanni del Virgilio, who was in correspondence with Dante Alighieri and Albertino Mussato.

After the death of their father in 1326, the two brothers both left Bologna, and after a period of economic difficulties they returned to Avignon. Here Petrarch finally abandoned his Law career and he assumed lower holy orders, which did not impose ecclesiastical duties but still enabled him to obtain some lucrative posts and canonries. Indeed, for the rest of his life, his ecclesiastical appointments would remain his primary source of income.

On Friday April 6, 1327, in the church of Sainte Claire in Avignon, he met Laura; this would become a pivotal biographical event for his poetic output. As for Dante, the encounter with a woman (cf. the *Vita Nova*) was the moment in which biography blended with fiction. Laura

was in real life perhaps the daughter of Audiberto di Noves, and she was married to Ugo de Sade, or otherwise Laura di Sabran, or Laura Colonna; there are yet more suggestions that have never fully satisfied historians but which on the other hand made her literary mystery even more compelling: that is where her true authenticity can be found. The collection of poems composed in her name, the *Rerum vulgarium fragmenta*, a series of fragmentary themes handled in vernacular Italian, consists of 366 compositions, one for each day of the leap year. Most (317) are sonnets, while 29 are songs (*canzoni*), 9 are sixtains, 4 are madrigals, and 7 are ballads. The initial core dates to 1336–1338, when Petrarch recopied a group of sonnets and a fragment of a song. In 1342, these poems were formally reorganized for transcription, but only after the death of his beloved Laura in 1348 did Petrarch conceive of a songbook (*Canzoniere*), a lengthy project that saw a number of intermediary stages, which would occupy him till his death. The final edition has been transmitted by the manuscript MS Vatican City, Apostolic Vatican Library *Vaticano latino* 3195, partially in his own hand. Another important codex, copied by Petrarch himself and by his helper Giovanni Malpaghini, is the MS *Vaticano latino* 3196 (known as Codice degli abbozzi). More than any other work this would influence subsequent Italian and European poetry as the stylistic and formal basis of Petrarchism.

In 1330, economic difficulties tied to the exhaustion of his father's inheritance drove him to look for employment, and his first ecclesiastical position was as chaplain of the family of cardinal Giovanni Colonna, where he would remain until 1347. His life was full of continuous travel, taking him in 1333 to Paris, Lyon, Liège (where he discovered two orations by Cicero), and Germany. In the meantime, he was receiving canonries from the new pope Benedict XII, who had succeeded John XXII in 1334, and with whom Petrarch maintained a close relationship, constantly urging him to return the Holy See to Rome.

In 1335, he met Simone Martini in Avignon, who painted a portrait of Laura. Petrarch then discharged his only ever legal commission, as he secured the pope's support for Mastino della Scala,

signore of Verona, who had just completed his conquest of Parma. In 1336, in the company of his brother Gherardo, he presumably climbed Mount Ventoux, in Provence by Carpentras, an experience which became part of the *Secretum* in his personal dialogue with Augustine. In the same year, Cardinal Colonna recalled him to Rome, but he soon returned to Avignon, and he bought a house in Valchiusa, thus fulfilling his dream of a solitary life surrounded by nature. Probably in the summer of 1337, his son Giovanni was born at Avignon to a mother whose identity remains unknown. At this time, he worked on the *De viris illustribus* and he began the *Africa*. His life was full of institutional and intellectual projects, but he always found time for his own work and studies.

On September 1, 1340, Petrarch received both from the University of Paris and from the Senate of Rome the offer of a poetic crown, the highest recognition available at the time. After having sought counsel from Cardinal Colonna (*Familiares* IV, 4), he decided to accept the proposal from Rome, influenced by the tradition of literary coronations in the Capitol. That autumn he went to Naples in order to be examined for an entire month by Robert of Anjou on the idea of the poetic art, on the details of the laurel wreath, and on the aims of poetry. This was how on April 8, 1341, still so early in his literary career (he was still drafting the *De viris illustribus* and the *Africa*, while the *Canzoniere* was still unknown to most), Petrarch received the crown, and for the award it was decided to bring the ancient world back to life with a memorable ceremony that, so it was said, had last been celebrated twelve centuries ago when paying tribute to the Latin poet Statius. In the *Sala del Palazzo del Senato* in the Capitol, he was recognized as a poet "laureate," and he was crowned with a laurel wreath in Rome by King Robert of Anjou as "Magnum poetam et historicum" ["great poet and historian"], he was given the title of *magister*, the appointment of Professor of Poetic Art and History, the formal endorsement of his present and future writings, the bestowal of all rights and privileges enjoyed by other professors of the noble and liberal arts, and he was granted Roman citizenship. It was on this occasion that Petrarch delivered his famous speech on the function of poetry, *Collatio Laureationis*. Its first

section is a discussion of the difficulties of the poetic profession, which can be overcome through love for the craft itself. With citations from Virgil and Cicero, Petrarch explains his handicap in dealing with a contemporary audience, which was less disposed to poetry than in Augustan Rome. He then analyzes the allegorical character of poetry, which allows authors to handle any topic, from physics to morals, under the mask of fiction. Through allegory, a poet can transform reality, but he cannot invent it (the same occurs in his poetry for Laura). Topics appropriate for poetry involve recognition of the glory and the immortality of the fame it bestows. He then cites Virgil, especially the *Eclogues* and the *Aeneid*, in discussing the role of the laurel itself, an evergreen plant that symbolizes eternal glory, especially since it is never struck by lightning.

He then moved to Parma where he stayed through January 1342, when he concluded a rough draft of the *Africa*. Between late 1342 and 1343, he was in Avignon and Valchiusa. At Avignon, he became a close friend of Cola di Rienzo, who happened to be in France on an embassy from the Pope. He shared Petrarch's desire to transfer the Holy See back to Rome; although the Eternal City had long been in decline, they aimed to restore its ancient pride and reputation, hoping for a long-term rejuvenation. In 1343, his daughter Francesca was born to a mother whose identity is unknown, as is that of the mother of his son. He served on an embassy from the Colonna family to Rome and to Naples on behalf of the pope, requesting the liberation of three prisoners from the powerful Pipini family, but in vain. When he returned to Parma, he thought about buying a house and moving there for good, but the idea was soon abandoned. In 1345, he began the composition of the song *Italia mia*, in which he asks political leaders to sacrifice their own personal interests and to devote themselves instead to egalitarian policies; this was in reaction to the deteriorating political situation both in Parma and more broadly throughout Italy, whose *signori* were so consumed by their rivalries that they had become oblivious to the needs of the masses who were growing desperate. This example of political writing in Petrarch would in fact be cited by Machiavelli in the 26th chapter of the *Prince*. Once the

civil strife in Parma became intolerable, Petrarch moved to Verona. There, in the Biblioteca Capitolare, Petrarch found further epistles from Cicero to his brother Quintus, to Atticus, and to Brutus, which he transcribed in his own hand. This discovery gave him a fundamental model of letter writing where he could converse with long-distance friends informally, with a flowing style that would then be further developed in the Renaissance. It proved to be a real gold mine for subsequent studies on Cicero, which inspired Petrarch to write letters of his own to great intellectuals of the past, such as Seneca, Varro, Quintilian, Horace, and Virgil, not to mention Cicero himself.

In Verona, before returning to Provence that autumn, he met Pietro Alighieri, son and commentator of Dante, with whom he maintained cordial relations. Once he was back in Vacluse, he immediately set out for Avignon in order to ask Pope Clement VI to return to Italy. Even though the pope was willing, this was in fact delayed till 1377. In return, the pope offered him in 1346–1347 the positions of Bishop and Papal Secretary, but Petrarch declined, figuring that such a commitment would take away time from his studies and his writing.

As for politics, Petrarch initially gave his full support to the Roman revolution led by Cola di Rienzo, as did the pope, since they hoped it would finally restore the fortunes of the city of Rome. The poet contributed to the election of Cola di Rienzo with a heartfelt letter themed on liberty against tyranny (*Variae*, 48). In 1348 in Parma, Petrarch met and became close friends with Luchino Visconti, *signore* of Milan. But this was the year in which the population of Europe was being decimated by the Black Death, which took many friends of Petrarch, including cardinal Giovanni Colonna, and on April 8 caused the death of Laura.

In 1349, he was appointed canon of the Duomo of Padua by Jacopo II of Carrara, and in 1350, he began a correspondence with Giovanni Boccaccio (1313–1375), and the two stayed in touch for the rest of his life. Boccaccio was constantly encouraging him to read and study Dante, and although Petrarch was not fully convinced to do so, his verses still convey implicit references to Dante

and imply that Petrarch took his friend's advice. During the Jubilee year, Petrarch while on his pilgrimage to Rome to pay his indulgences, stopped in Florence for a brief 48 hours to visit Boccaccio: this will be his only ever stay in the Tuscan city that exiled his father. In 1350–1351, Petrarch mainly resided in Padua at the court of Francesco I of Carrara. Here, in March 1351, Boccaccio visited him as a ambassador of the Commune of Florence, and he offered him a position as a teacher in the Florentine *Studium*. But Petrarch declined and returned to Avignon where he also rejected the position of Apostolic Secretary. His decision however caused tensions with the new pope Innocent VI and led Petrarch back to Italy, for good this time.

In 1353, he settled in Milan at the court of the Visconti, where he would remain until 1361. Giovanni Visconti, Archbishop and *signore* of the city, as well as enemy of Florence, offered him not only hospitality but also a role as ambassador of Visconti policies. Petrarch shuttled between Paris, Venice, and Prague, and he met with Emperor Charles IV in Mantua. In Milan, Petrarch worked on the *Secretum*, the *De otio religioso*, a number of letters from the *Familiars* to the *Seniles*, collections of poetry in Latin (*Epystolae Metricae*) and Vulgar Italian (*Triumphs*), and continued the *Rerum vulgarium fragmenta*. This period of concentrated intellectual and spiritual development saw him build upon his erudite philological training to produce a new kind of philosophical literature founded upon Neoplatonic and Stoic principles of ethics.

In 1361, he fled the plague, first to Padua and then in 1362 to Venice. The Republic allowed him the use of Palazzo Molin in exchange for a pledge to donate upon his death his entire private library, the largest in Europe, but in 1367, after enduring some fierce accusations from a number of Averroist philosophers, he withdrew his offer. In Venice, he remained until 1368, where he hosted Boccaccio for a while.

He returned to Padua as canon to his friend Francesco I of Carrara; he was given a house in Arquà, into which he moved in 1370. There, he devoted himself almost entirely to revising his works, especially the *Canzoniere* over which he labored throughout his remaining days. During

the night between July 18 and 19, Petrarch died on the eve of his 70th birthday, and he was buried in the town church of Santa Maria Assunta. Similarly to Dante, the story of his sepulture is troubled and mysterious. After his tomb was opened, it was discovered that parts of his presumed corpse are in fact that of a female who died c. 1207. Moreover, his left arm was stolen in the seventeenth century, and his skull too was never recovered.

Heritage and Rupture with the Tradition

In the late thirteenth century, an age of feudalism and superstition was coming to an end, and the religious experience of a number of Europeans was growing more proactive and personal. After centuries of protracted religious, social, and cultural closure, horizons were once again being broadened intellectually, morally, and politically, and people began to feel more responsible for their actions as part of an organized community. Indeed, the fourteenth century witnessed the development of Humanism, a cultural movement provoked by a new approach to human culture, rehabilitating the intellectual and practical capabilities of human beings with respect to God. Individuals were now reexamining, through philosophy and the arts, their role in both the earthly and the heavenly worlds. They were increasingly looking for answers to the history of human thought; in this way, a new interest in philology was born, fueled by respect and appreciation for literary texts as transmitters of knowledge and human values.

While Dante had already anticipated the value of restoring classical literature, choosing Virgil as his guide in the *Inferno* and *Purgatorio*, Petrarch was rediscovering documents of classical culture that had been preserved by the Church and were kept out of free circulation. When he made his collection of books available to the public, he thus created for the first time the idea of a public library. On both of these points, Petrarch stands out amid the intellectual panorama of the fourteenth century, a guaranteed reference point for the attitude of a Renaissance intellectual. Among the vast number of extant medieval authors, Petrarch more than any other displayed a Humanistic spirit in search of the foundations of human culture,

looking to literature as evidence of the past, especially of the cultural civilization of Latin society. His contribution to the philological study of the Humanities is invaluable, promoting the idea that culture is a convergence of ancient wisdom, literary traditions, and past political institutions.

In his poetry in Vulgar Italian and in his Latin works, Petrarch maintained themes from the medieval tradition, such as aspiring to divine grace through the image of a woman, symbolizing the cosmic energy enclosed in the concept of God and activated through the eyes of the beloved. Even the concept, for example, of a dialogue with oneself represented through the fiction of a conversation with a Church Father – in his own case with Augustine in the *Secretum* – derives from the medieval intellectual perspective as a form of private confession and of respect for theological authority. In both of these aspects, however, there is a decisive departure from the fixed patterns of the Middle Ages in the way in which Petrarch examines himself, exploring his own essence in depth, and refusing to spend all his energy on the impossible attainment of his object of desire. For today's readers, this is the aspect that makes Petrarch feel closest to our own modes of self-expression. While Dante in the *Divine Comedy* embarks on a journey through the vices and virtues of human beings, and while Boccaccio represents in his *Decameron* human society in good and bad, Petrarch analyzes his own soul until he can compose its very biography. His idea of poetry involves entering in contact with the human spirit, with its feelings and its frailties. For this reason, he turned to classical texts that might help him to better understand the evolutionary trajectory of humans in society. This marked a rupture with the past that was still so dependent on religion that it restricted the open discussion of self-awareness and of examination of human attitudes, thoughts, and feelings.

On a linguistic level, he is likewise worthy of the title of Father of Humanism, as he reworked the rather crude Latin that was in vogue in the Middle Ages, raising it to its classical caliber as an elegant language of communication between great minds. Nor should his enormous linguistic contribution to Vulgar Italian be neglected, as he

standardized the written language for centuries, hence his verses were immediately easy to translate into a number of European languages, unlike Dante, whose Italian was for a while considered too complex.

Just like a modern intellectual, in order to devote himself to his own writings, Petrarch looked for patrons who would give him the time and the money to enable him to continue his studies. For this reason, he declined a number of official commissions, and he never pursued influential positions that would detract from his dedication to intellectual activity, or that would set him in opposition to heavyweights both religious and political.

Works

Letters

Petrarch composed a number of letters in Latin, of which some were sent and others were destined to his epistolary collections; his primary objective in all was to transmit an ideal image of himself as an exponent of the new Humanistic culture that communicated through epistolary writings, in accordance with classical models. The letters are particularly useful in conveying his restlessness (*Familiaries*), but even more interesting perhaps are those written in old age (*Seniles*) where he is more open, and he describes himself with humility and abundance of detail. Indeed these are envisioned for a wider audience than the immediate addressees, and they are organized into four collections. The *Familiaries* (*Familiarium rerum libri*) were addressed to friends and acquaintances to whom he would tell the story of his philological discoveries in libraries throughout Europe and in abbeys in Northern Italy; these are 350 letters divided into 24 books, written between 1325 and 1366. The final section of the collection contains letters addressed to great writers from classical antiquity, personal role models such as Homer, Seneca, Cicero, Horace, Virgil, Quintilian, etc. These authors are all conveyed as alive and fully participating in the poet's own times, reborn and rediscovered to take his age into the Renaissance.

The *Seniles* (*Rerum senilium libri*), dedicated to Francesco Nelli known as "Simonides," Prior of the Church of Santi Apostoli in Florence, consist of 126 letters written in the last phase of his life, between 1361 and 1374, the year of his death. They are divided into 17 books and they are conceived as a continuation of the *Familiaries*, interrupted after the death of "Socrates," nickname of the dedicatee Ludwig van Kempen, a Flemish Benedictine monk and music teacher of cardinal Giovanni Colonna in Avignon. This collection, whose structure is the posthumous work of the poet's friends and students, contains the section of letters to Boccaccio.

The *Liber sine nomine* is in 19 letters written between 1342 and 1358, and its addressee's name was omitted from the work for the sake of his security, owing to its polemic argument against the Papal Curia in Avignon. *Epistolae metricae* (1333–1361), 66 letters in hexameters, is on the model of Greek and Latin antiquity, discussing love, literature, and politics. *Variae* or *extravagantes*, 76 letters on different themes in different times rather than an organic whole, were collected by the poet's admirers after his death. These are letters that Petrarch himself excluded from his other books and would rather not have published while he was alive.

De Viris Illustribus

The work *De viris illustribus* consists of 36 short biographies of famous characters from the ancient world. Written in two different editions, the first was of 22 biographies of famous Romans, from Romulus to Cato the Elder, composed between 1338 and 1351; this work too earned its author's title of Poet Laureate, for the text remained faithful to the Humanistic idea of rediscovering the classics, or even more of bringing back to life ancient writers and thinkers. The second edition, defined as "universal," was written c. 1351; its setting was inspired by Augustine's *De civitate Dei*. The last phase, c. 1370, complied with the request by Francesco I of Carrara to cap the series of biographies with famous men linked to Padua. This section was completed after the poet's death by Lombardo della Seta in 1379–1380.

Africa

The *Africa* (begun between 1339, 1342, and 1351–53) consists of 9 books out of 12 projected. It is an epic poem on Scipio and the Second Punic War, modeled on Cicero's *De re publica*, Book VI particularly, which contains the *Somnium Scipionis*. The poem's topic derives from Livy, while the epic inspiration is from Virgil's *Aeneid*. Thanks to this work, and in particular to the classical models, which provided inspiration for both meter and content, Petrarch earned his poetic crowning in Rome (1341) by Robert of Anjou, to whom the poem is dedicated.

Rerum Memorandarum Libri

The *Rerum memorandarum libri* are collections of anecdotes linked to famous characters from past and present, categorized according to the four cardinal virtues: prudence, justice, strength, and temperance. Begun in 1343, it was abandoned in 1345 and never completed. This collection of historical examples and anecdotes for the purpose of moral education in Latin prose is modeled on the *Factorum et dictorum memorabilium libri* by Valerius Maximus.

Bucolicum Carmen

The *Bucolicum carmen*, written between 1346–1349 and 1361–1366, is a collection of 12 eclogues, poems in a pastoral setting taking the form of dialogues between allegorical characters who discuss love, morality, and politics following the model of Virgil. We find among the characters, for example, his brother Gherardo (Monico), who urges Petrarch (Silvio) to devote himself to poems on holy themes, and Laura (Dafne), who crowns Petrarch (Stupeo) with a laurel wreath. Other examples include a lament on the death of Robert of Anjou and on the ruins of the Kingdom of Naples; a celebration of the achievements of Cola di Rienzo; a denunciation of the corruption of the Papal Curia in Avignon; the plague; the death of Laura. Mainly because of its complexities in interpretation and its abundance of historical and allegorical references, the *Bucolicum carmen* was already being studied in universities while Petrarch was still alive.

De Vita Solitaria

The *De vita solitaria* (1346, 1353, 1366) is an ethical treatise in two books, which praises solitude as an existential condition that is crucial to a life of contemplation and attainment of intellectual spirituality. Here Petrarch sketches the ideal figure of the sage, which evokes his brother Gherardo after he became a monk.

De Otio Religioso

The *De otio religioso*, begun in 1347 after a visit to Gherardo, was constantly reworked until 1357. It is a treatise in two books on monastic life, similar to the *De vita solitaria*, and it tries to show that pagan life prefigures Christian life.

Psalmi Penitenciales

The *Psalmi penitenciales* are seven prayers of forgiveness in rhyming prose, which express contrition for past sins. They were composed c. 1347–1348, modeled on biblical psalms.

Secretum

The *Secretum*, whose complete title is *De secreto conflict curarum mearum*, is a personal dialogue in three books. A first draft was written in c. 1347, then a second in 1349, and a third in 1353. It is an imaginary dialogue with Augustine, who helps the poet after he has a vision in which Truth offers to heal the evils of his soul. The exchange with Augustine underscores once more in a work of Petrarch the importance of the dialogue with the past brought to life through actual conversation. In Book III, for example, they discuss his love for Laura and his ambition for glory, which Petrarch considers his noblest aspirations, but Augustine interprets them as shackles of the soul which obstruct him in his search for wisdom. As formal models for the *Secretum* Petrarch used the philosophical dialogues of Plato and Cicero, but his ideological model is the *Confessions* of Augustine.

Invective Contra Medicum

The *Invective contra medicum* is a polemical work against a medical doctor of the Papal Curia whose identity Petrarch conceals. Written at a time when Pope Clement VI was ill, it advertises the

superiority of poetry over all spiritual activities, in opposition to the claims of doctors who consider their profession equivalent to a liberal art.

De Remediis Utriusque Fortunae

The *De remediis utriusque fortunae* is an ethical treatise in two books written c. 1354–1366. Each chapter contains a dialogue following the model of the *Secretum* between Reason, Joy, and Hope (Book I), or between Pain and Fear (Book II). The arguments of Reason balance the optimistic or pessimistic excesses to which the soul is driven by its passions. Inspired by a treatise often attributed to Seneca, the *De remediis fortuitorum* was mentioned by Boccaccio in his *Genealogie deorum gentilium* as a work of absolute originality in the genre.

De Sui Ipsius et Multorum Ignorantia

The *De sui ipsius et multorum ignorantia* is another polemical work against four Aristotelians visited by the poet during his stay in Venice, as he rebuts their accusations. It was written c. 1367.

Invectiva Contra Cuiusdam Anonimi Galli Calumnia

The *Invectiva contra cuiusdam anonimi Galli calumnia* is a work of invective against a French monk who supported keeping the papacy in Avignon, while Petrarch continued to advocate recalling the pope, in this case Urban V, back to Rome. It was written c. 1373.

Apart from some *Epistole*, Petrarch wrote only two works in Vulgar Italian: the *Canzoniere*, which is his most important and renowned masterpiece, and the *Trionfi*.

Rerum Vulgarium Fragmenta

The project of the *Rerum vulgarium fragmenta* was originally conceived as an organic autobiographical journey that celebrates his love for Laura in two different sections: sonnets 1–263 on the woman's life and 264–366 upon her death. It was composed over an arc that traverses almost the entire life of the poet, from c. 1336 to 1373–1374. His feelings for Laura are the core theme of the work, an unrequited love whose

motivations are debated over the narration of the poems, together with other secondary themes such as criticism of papal corruption in Avignon and, more broadly, contemporary politics. The work opens with a kind of proem that includes the first five sonnets, in which he asks for compassion from his readers for the mistakes of his youth that had kindled in the poet this passion no less deep than, as was ultimately revealed, it was based on an illusion. The second and third sonnets investigate the origin and circumstances of falling in love, while the fourth and fifth pursue the birthplace and significance of the woman's name, which gives rise to a number of linguistic variants that help the poet to amplify his own nomenclature, elevating the person to natural elements essential to life, such as air and poetic glory. The name "laura" appears already in the autograph manuscript tradition (made or commissioned by the poet himself) in lowercase letters, in order to emphasize the Italian wordplay between the proper name and "l'aura," i.e., light breeze and air, crucial to breathing. He plays on the assonance with a poet's laurels ("laurea poetica"), out of which crowns were woven that provided the highest recognition for poets, in memory of Daphne and her metamorphosis into a laurel tree in order to escape Apollo, god of the Sun and of the arts, including poetry. Her name recalls also the dawn ("l'aurora") as the beginning of a new day, and gold (the latinism "l'auro"), which symbolizes not only the precious metal but also the purity and attainment of one's highest aspirations, according to the alchemists. After the proem, the narration proceeds by placing the poet center stage in his role of the young man in love at the mercy of his feelings; he compares the positive and negative aspects of his relationship with the woman, vacillating between the hope and hopelessness that transform the feelings and character of a man. These transformations are rendered in literature with constant references to Ovid's *Metamorphoses*, until the author is gradually persuaded that the woman is not exclusively an object of self-indulgent desire, but rather she can also contribute to the salvation of one's soul, and therefore only carnal passion is morally reprehensible. He then moves on to sublimation of this

desire, until concluding with a celebration of the spiritual elevation that can be provided by the love for a woman. This idea derived from Dante was initially difficult for the poet to accept, but it became necessary after sonnet 267, after the woman's death. This second section of the work spans all the author's doubts about the vanity of material objects, and it conveys the need for spirituality as a concrete path to salvation.

Trionfi

And finally come the *Trionfi*, composed from c. 1350 until the poet's death. This is an incomplete short poem in tercets on the model of the *Divine Comedy* of Dante. It is divided into six different Triumphs with Latin titles (*Triumphus Cupidinis*, *Triumphus Pudicitie*, *Triumphus Mortis*, *Triumphus Fame*, *Triumphus Temporis*, *Triumphus Aeternitatis*), and each one is devoted to visions experienced by the poet while he was asleep. In this allegorical work, Petrarch emphasizes once more the fundamental value of poetry, of his love for Laura both alive and dead, and more broadly of Love as a force that conquers all.

Impact and Legacy

Within a few years after the poet's death, "Petrarchism" had already become not only an Italian phenomenon but also a European one. In courts and academies throughout the continent, writers began to copy his expressive forms, especially the genre of the *Canzoniere* understood as a personal and intimate story of the poet, who tells the tale of how he fell in love. In the late fifteenth century, the lyric had once again become all but defined as love poetry, and it is from here that Petrarch became a stable point of reference.

The first rhymers who tried to imitate his style, such as Panfilo Sasso, Antonio Tebaldeo, and Serafino de' Ciminelli (Serafino Aquilano), fell short of his metrical precision and fullness of content, and their final product was closer to an intellectual game than to an authentic artistic expression. More successful results were achieved by the verses of Matteo Maria Boiardo and Iacopo Sannazaro, but

only in the next century did writers such as Marsilio Ficino, Giovanni Pico della Mirandola, and Leone Ebreo managed to associate Petrarch's idealism and tormented spiritual life with the values of Renaissance Neoplatonism. In these writers too, the love for a woman became a path to moral and spiritual elevation, and ultimately attainment of the divine.

After the invention of the printing press, the audience for literature and lyric expanded, both in numbers and in social composition. No longer restricted to a narrow elite, a national marketplace for culture emerged. This diverse audience from both cultural and linguistic points of view, from the South of Italy to the North, required a unifying basis, and through Petrarchism they tried to provide common themes and poetic language to writers and readers who were still tied to heterogeneous local conditions. After the 1530s, the lyric code became standardized under the common denominator of Petrarch, thanks to the publication by Pietro Bembo (1470–1547) of the *Prose della volgar lingua* (1525), a dialogue in Vulgar in which he offers Petrarch as a paradigm for every poetic confession and meditation, furnishing theoretical foundations to what had been the spontaneous, improvisational practice of Petrarchism. Bembo proposes Petrarch as a classical model of Vulgar literature throughout Italy, thus making him as much of a point of reference as Greek and Latin authors had been in the past.

A new class of intellectuals in search of identity found it in the poetic language of Petrarch, as did Bembo himself, who in 1530 published his own rhymes in corroboration of his linguistic theories. His rhymes moved beyond sterile imitation, insofar as they avoided Petrarch's structural model, while still borrowing his diction, imagery, and motivations, applying them to different situations than those of the *Canzoniere*. Petrarchism assumed its final shape in a style that was natural, composed, elegant, clear, and harmonious, all corresponding to sixteenth-century classical ideals. These writers, when faced with their own uncertain and confused mortality, turned to Petrarch for a discourse that transcended time.

If his language became a model for all of Italy, his translations inspired all of Europe. In Spain,

followers of Petrarch included greats such as Juan Boscán (1500–1544), Garcilaso della Vega (1503–1536), Luis de Góngora (1561–1627), and Francisco de Quevedo (1580–1645); in France, there were Pierre de Ronsard (1524–1585) and Joachim du Bellay (1522–1560); and in England no less than William Shakespeare. In Italy, other than Dante, Petrarch was the indisputable paradigm of musicality in verse, leading to failed attempts at imitation, in which the meanings of words were sacrificed to their melody, as in the case of seventeenth-century melodrama.

In the Renaissance, reading Petrarch was a cornerstone of one's poetic and more broadly intellectual formation. It is worth keeping in mind that at that time, knowledge was passed down through words, either one's own or those of other writers past and present. For this reason, Petrarchism can be defined as a rewriting of Petrarch, preserving both the intellectual and the spiritual processes of the poet. Subsequent generations have thus understood Petrarch more as a state of being than merely a love poet. For them, he came to signify above all the art of translating thoughts into writing with a style that was both simple and cultivated.

Petrarch, in this sense, was more than a poet or a writer: he provided a real *exemplum* of an intellectual humanist, able to infuse into his own work his love for literature, a refined sense of politics, and the practical value of learning. The dissemination of knowledge and the rediscovery of the classics characterized not only his writings but all his intellectual work, offering a combination of philology and philanthropy that could serve as an example for posterity.

Abstract

The teacher of Regiomontanus, Georg of Peurbach was one of the beginners in a thorough process of modernization of the traditional mathematical astronomy.

Alternate Names

[Peurbach, Georg of](#)

Biography

Georg of Peurbach was born in the village of Peurbach (or Peuerbach), near Linz, Austria. He matriculated at the University of Vienna in 1446 and in 1453 was enrolled in the Faculty of Arts. Between 1448 and 1453 he traveled through France, Germany, and Italy (especially in the Republic of Venice). Peurbach's interest in astronomy matured during this period by reading the works of Johann of Gmunden (c. 1380–1442) and by epistolary contacts with Giovanni Bianchini (c. 1410–c. 1469) and

Nicholas of Cusa (c. 1401–1464). In the 1450s, Peurbach accepted positions as court astrologer to the King Ladislaus V of Hungary and, later, to the Holy Roman Emperor Frederick III.

In 1450, while teaching at the University of Vienna, Peurbach met Johann Müller of Königsber, or Regiomontanus (1436–1476), who was one of his pupils. Within just a few years, the two formed a tight astronomical collaboration. Their observations of comets and eclipses made them aware that the existing astronomical tables were unreliable.

Along with several humanistic essays, in 1454 Peurbach completed the *Theoricae novae planetarum*. The work (published by Regiomontanus around 1474) was written to amend the so-called “Theorica Planetarum”, a thirteenth-century treatise erroneously attributed to Gerardo of Cremona (1114–1187). Peurbach represents the geocentric cosmos as a system of solid spheres carrying the three inferior planets (Moon, Mercury, and Venus), the Sun, and the three superior planets (Mars, Jupiter, and Saturn) around the immovable Earth. Inspired by the *Liber de mundo et coelo* – the Latin translation of an astronomical treatise of Ibn al-Haytham (c. 965–1039), who in turn derived his theories from the *Hypotheses on the Planets* of Claudius Ptolemy (second century) – Peurbach describes each planetary sphere as a compound of concentric and eccentric orbs. In this way, he provides a physical explanation for the planetary movements theoretically described in Ptolemy's masterwork, the *Almagest*. Due to its clearness, the *Theoricae* was commented upon and reedited more than 50 times up to the seventeenth century and also translated into French, Italian, and Hebrew.

Completed around 1459, Peurbach's *Tabulae eclipsium* (published in 1514) was in a minimal part the result of new observations. The work is based on the same astronomical parameters of the so-called “Alphonsine Tables”, dating back to the mid-thirteenth century. Nevertheless, the *Tabulae eclipsium* has the remarkable advantage of providing much more user-friendly computational procedures.

Peurbach's and Regiomontanus's program to renovate astronomy received strong encouragement from Johannes Bessarion (1408–1472), Archbishop of Nicaea, who arrived in Vienna in 1460 for a diplomatic mission. When the three met, Bessarion proclaimed his intention of promoting the writing of both a new translation and an abridged version of the *Almagest*. Peurbach had a good knowledge of Ptolemy's masterwork, mainly through its two Latin translations prepared by Gerardo of Cremona and George of Trebizonde (1395–1473). He immediately agreed to personally take over the burden of preparing the abridgment. In addition, Peurbach and Regiomontanus made plans to follow Bessarion on a trip to Italy. Their aim was to study the Greek astronomical manuscripts which the Archbishop had with him and other manuscripts that might be found in that country.

Unfortunately, Peurbach died in 1461 before starting the trip. At that time he had prepared only the first six chapters of the *Almagest* abridgment. In fact, the *Epitome in Almagestum Ptolemei* was completed by Regiomontanus in 1463 and published in 1496. These first six chapters are actually for the most part a readaptation of another thirteenth-century text, the *Almagesti minoris libri VI*. Notwithstanding such limitations, up to the early seventeenth century, the *Epitome* became one of the primary reference texts used by scholars interested in Ptolemaic geocentric astronomy.

Pharmacology in the Renaissance

Andreas Blank

Department of Philosophy, Alpen-Adria
Universität Klagenfurt, Klagenfurt, Austria

Abstract

In addition to practical handbooks, academic medicine in the sixteenth century offered various metaphysical accounts of the nature and causal powers of medicaments. One important strand of thought tried to reduce pharmacological powers to elementary qualities and their modifications in mixtures. In this context, the distinction between primary, secondary, and tertiary qualities was discussed. Another strand of thought ascribed so-called pharmacological powers "of the whole substance" to celestial influences. A third strand of thought discussed critically the prospects of applying emergentism – the view that from complex combinations of elementary qualities, new substantial forms with irreducible causal powers could arise – to the analysis of medicaments. While this third strand of thought faced serious ontological difficulties – such as the question of how something substantial could arise from something qualitative and the question of how unities could arise from multiplicities – some Renaissance pharmacologists adopted emergentism for particular groups of medicaments such as purgative drugs.

Introduction

Renaissance pharmacology produced a wealth of practical handbooks that listed medical properties of minerals and plants and described procedures for the preparation of medicaments (see, e.g., Lodovici 1540; Mattioli 1569; Ulmus 1597; see Palmer 1985). Paracelsus and the Paracelsians combined the practical aspects of “chymical” medicine with the stipulation of occult entities (such as heavenly spirit, demons, and “signatures”) and of powers deriving from them (such as “magnetic” sympathies and homeopathic causation). Within academic medicine, on which the present entry will focus, some pharmacological work incorporated considerations concerning the metaphysical analysis of the nature of medicaments and their modes of operation. These metaphysical views were still very much under the influence of a distinction going back to ancient medicine: the effects of medicaments that were taken to be explainable by the elementary qualities, their mutual modification in mixture, and the combination of these modified (or “tempered”) elementary qualities were distinguished from effects of medicaments that were taken not to be explicable in this manner. Galen coined the expression that a medicament of the latter kind possesses the capacity of “altering by its whole substance” (see Copenhaver 1991). There was unanimous agreement that some pharmacological potencies could be explained in a reductive way – a way that does not invoke any causal powers in addition to the causal powers of elements modified through their interaction – although there was some disagreement concerning the question of whether or not the potencies brought about by these “primary potencies” should be distinguished into different categories themselves. By contrast, there was fundamental disagreement concerning the question of whether or not pharmacological actions of the whole substance could be subsumed under a reductionist pattern of explanation. Most thinkers who advocated a non-reductive analysis of pharmacological potencies of the whole substance adopted various theories of celestial causation. But emergentism – the view that the temperament can bring forth novel causal

properties that cannot be analyzed as combinations of the causal properties of the constituents of a composite – was clearly perceived as a possible theoretical alternative, which in some cases, in spite of critical responses, was adopted by sixteenth-century thinkers.

Medicaments and Reductionism

In Renaissance pharmacology, the view was widely shared that some potencies of medicaments could be understood as being identical with combinations of primary qualities – i.e., the qualities hot, cold, wet, and dry. According to this view, many medical powers could be understood as secondary qualities that consist in the mutual modification and combination of primary qualities in a mixture. However, there was some disagreement as to whether or not this distinction should, within a reductionist framework, be supplemented by the concept of tertiary qualities. Guilielmus Puteanus (Guillaume Dupuis), professor of medicine at the University of Grenoble, for instance, surmises that since in all effects that can be explained in a reductive way, only tempered primary qualities are causally efficacious; the concept of secondary qualities is sufficient to capture all effects of these medicaments (Puteanus 1552, 22, 25–26). By contrast, Girolamo Mercuriale (1530–1606), a medical humanist and physician to Cardinal Alessandro Farnese (see Siraisi 2003; Arcangeli and Nutton 2008), gives a differentiated account of what he calls “secondary potencies” (*secundae facultates*) and “tertiary potencies” (*tertia facultates*). Examples of secondary potencies are the capacities of medicaments to make parts of the organism denser and harder (or the opposite) (Mercuriale 1590, 11v). Examples of tertiary potencies are the capacities of medicaments to split up gall stones, to move urine, to draw menstrual blood, or to purge the lung or the seed (Mercuriale 1590, 17v). In both cases, what is causally efficient, according to Mercuriale, are the tempered elementary qualities – in this sense he says that the secondary and tertiary potencies “have nothing new.” However, he notes a significant difference: The secondary potencies can be

used for a variety of different purposes, and, in this sense, they are indeterminate with respect to a particular goal. By contrast, the tertiary potencies are specific to particular conditions of particular organs, and, in this sense, they are determinate with respect to a particular goal (Mercuriale 1590, 11v, 17v). Although Mercuriale does not mention the origin of this distinction, it can be found in one of Avicenna's smaller works, *De viribus cordis*, which Mercuriale mentions in a different context (Mercuriale 1590, 21r). Avicenna expresses the distinction as follows: "The qualities that are attributed to medicaments with respects to the impression that they make upon the body as beneficial to it remain to be dealt with: some of them are taken to derive from absolute actions, some of them are taken to derive from actions relating to special parts of the body" (Avicenna 1608, 341). By implication, "absolute" actions are to be understood as actions that occur in various body parts.

In spite of the scope of such reductive explanations of pharmacological phenomena, Puteanus and Mercuriale believe that not all effects of medicaments can be explained in this way. This is why Puteanus adopts a theory of celestial causation (see section "[Medicaments and Celestial Causation](#)") and Mercuriale adopts emergentism to explain the occurrence of these effects (see section "[Medicaments and Emergentism](#)"). Diverging from such hybrid accounts, some Renaissance thinkers expanded reductionism also to pharmacological actions of the whole substance. One of these thinkers is the Madrid-based physician and philosopher Francisco Valles (1524–1592, see Martin 2002), who regards this type of action as an outcome of the combination of similarity and elementary powers. He invokes similarity as an explanation for the specific actions of purgative medicaments on determinate body fluids (Valles 1582, 363). At the same time, he concedes that similitude cannot explain the direction of action since a medicament is no more similar to a determinate body fluid than this body fluid is similar to the medicament (*ibid.*). His solution is to suggest that what is causally efficient in attraction is elementary heat and that the direction of action can be explained by the presence of greater heat in one

of the relata (*ibid.*, 364). As he argues, similarity is nevertheless causally relevant. In his view, similarity does not concern elementary qualities but rather qualities such as thickness and thinness, friability, and its contrary (*ibid.*) – generally the qualities that follow what he calls the "mode of a substance" (*ibid.*) and what we now would call its structural properties. Valles's thought seems to be that greater heat inherent in the medicament can become operative only when the structural properties of the medicament resemble those of the body fluid upon which it acts. The concept of qualities that follow the mode of a substance brings in a sense in which only the combination of the causal powers of an elementary quality with structural properties that belong to an entire material compound produces pharmacological actions of the whole substance.

The most sustained chain of arguments in favor of a reductionist account of pharmacological actions of the whole substances can be found in the work of the Heidelberg-based physician Thomas Erastus (1524–1583). Erastus has recently received considerable attention as a defender of Aristotelian natural philosophy against alchemy and Paracelsian "chymistry" (see Newman 2006, 45–65), and also his role as a public figure in the complex confessional development of the Palatinate has been studied in detail (see Gunnoe 2011). For present purposes, his analysis of so-called "occult" qualities deserves attention. Erastus accepts two kinds of occult qualities: (1) those that are due to substantial forms and (2) those that are due to the temperament alone. An example that he mentions for the first kind of occult quality is the capacity of the torpedo fish to numb the hand that touches it (Erastus 1574, 25). This, however, is in his view not the kind of occult potency that is observed in medicaments. The occult potencies of medicaments, as he maintains, "can be reduced to" the potencies of the temperament of elementary qualities (Erastus 1574, 31).

Erastus gives a series of arguments for his claim that "the potencies of medicaments are not properties of substantial forms" (Erastus 1574, 23). The first of these arguments could be dubbed the "Dependence on Life Argument":

These qualities that depend in this way on form and are in the composite through the form are present when the form is present but when the form disappears, they must simultaneously disappear. For if they could inhere in a subject that is not informed by this form, they would not at all depend on this form. (Erastus 1574, 13)

Thus, if qualities that arise from forms depend on the persistence of life, qualities that persist after the death of a living being cannot be thought of as qualities that arise from forms. But this is exactly what can be observed in plant-based medicaments, since it is possible to separate by chemical procedures medically efficient plant parts; hence, their pharmacological powers cannot depend on the substantial form of the plant (Erastus 1574, 14; 18).

A second argument that Erastus uses could be called the “Variation of Powers Argument.” According to this argument, qualities that arise from substantial forms should be found in all individuals with substantial forms of the same species. But with respect to the medical powers of plant parts, there is variation from individual to individual (Erastus 1574, 14, 22). Hence, Erastus concludes that these medical powers cannot be essential, form-related qualities (Erastus 1574, 26). An extreme case of variation is the entire loss of powers: poison and medicaments can lose their power through long-standing acquaintance of the body with them; however, according to the conception of forms as essences, the powers of the substantial forms cannot diminish over time in this way (Erastus 1574, 15). The implication seems to be that a power that can be lost through mere long-standing acquaintance cannot be an essential quality that derives from a substantial form.

A third argument that Erastus uses could be called the “Activity Dependence Argument.” According to this argument, potencies of substantial forms follow immediately from substantial forms; potencies of medicaments, by contrast, need an external principle to become active. This follows from the fact that medicaments need to come into contact with the heat of a living body to become active. But, as Erastus argues, this is something that they have in common with all faculties that follow from the properties of matter

and the temperament alone (Erastus 1574, 27–28). Finally, a fourth argument could be dubbed the “Body Dependence Argument.” This argument starts from the assumption that potencies of substantial forms are most active when their body is in perfect shape; by contrast, it can be observed that the potencies of medicaments often presuppose the dissolution of natural bodies, for instance, in the preparation of pharmacological powders, and that many medicaments operate more strongly once they are ground to powder (Erastus 1574, 28–29).

Taken together, these arguments lead Erastus to a reductionist account of the notion of pharmacological actions of the whole substance: “we say that the whole substance acts because it acts not only through one or two qualities that dominates over the other qualities in mixtures but rather by the forces of the whole matter composed and mixed of so-and-so many parts of such-and-such a nature” (Erastus 1574, 46). As he explains: “We understand by ‘whole substance’ and ‘whole temperament’ not only the temperature brought about by the mutual action and passion of primary qualities considered, as it is called, abstractly, but rather together with the subject matter” (Erastus 1574, 47). Thus, in Erastus’s view, the only sense of wholeness required to explicate the notion of pharmacological actions of the whole substance is captured by the view that these actions involve the causal powers of the entirety of elementary qualities entering a temperament, plus the view that these powers never occur outside a material substrate.

Medicaments and Celestial Causation

One of the alternatives to such reductionist accounts of pharmacological actions of the whole substance invoked celestial influences on medicaments. For instance, in his treatment of purgative medicaments, Puteanus refers to the authority of a thirteenth-century pharmacological work ascribed to the Arabic physician Johannes Mesue (Yuhanna ibn Masawayh; on the authorship of this text and its influence, see De Vos 2013). Puteanus follows commentators on

Mesue such as Mondinus de Leuciis (Mondino dei Luzzi, ca. 1275–1326) and Johannes Costaeus (Giovanni Costeo, 1528–1603) when he interprets the nature of celestial influence that Mesue has in mind as theory concerning the celestial origin of forms (Puteanus 1552, 37). The relevant passage from Mesue reads as follows:

A medicament is purgative, and it acts upon the matter that has to be purged not due to the temperament nor in the way in which two contraries act upon each other, insofar as they are contraries, nor in the way one of two similar substances attract and draw out each other, nor like a heavy body moving downwards and a light body moving upwards, but because such a power originates in the heavens. (Mesue 1552, fol. 2v)

In his commentary on this passage, Mondinus maintains that Mesue ascribes the powers “of the fourth degree” to the specific form, for instance, the power that draws out a particular body fluid (Mesue 1552, fol. 5v). As Mondinus explains, “this specific form is nothing other than something added to the complexion by means of which it exerts an operation, such that even if the complexion is not the primary principle of occult operation, it nevertheless supports the occult action of this solving medicament” (ibid., fol. 6r). In particular, Mondino invokes the notion of specific form to explain why the medicament not only acts upon a determinate body fluid but also draws this fluid out on a determinate path and deposits it at a particular place (ibid.). This conception of the role of specific forms is taken up in Costaeus’s commentary (ibid., fol. 2v). Moreover, Costaeus gives the following characterization of the relation between similarity and celestial powers in the workings of purgative medicaments: “This attraction has to be ascribed to similarity not as an efficient cause, but as a *causa sine qua non*: such that the action is primarily referred to as being received from the heavens, from whose womb both the forms and the properties of forms emanate” (ibid., fol. 4v). Given the standard understanding of emanative causation as a process in which the effect instantiates in less perfect for the essence of the cause, such a conception of the origin of the forms of medicaments and their potencies implies that such

pharmacological potencies are themselves celestial potencies inhering in material composites.

Perhaps the most spirited defense of the idea of celestial causation in the origin of the forms of medicaments and of living beings can be found in the work of Jean Fernel (ca. 1497–1558). Fernel maintains that “the single Form of the Heaven comprehends in potency all forms, be they already existent or simply possible, of living beings, plants, stones, and metals, and as if pregnant with innumerable forms, begets and spawns from Herself everything...” (Fernel [1548] 2005, 111). Thus, mixed bodies such as metals, stones, plants, and animals “draw their essence of their form from heaven” (Fernel [1548] 2005, 315). He is explicit about the view that subcelestial bodies derive their form from the heavens because the motions of subcelestial bodies are influenced by the movements of celestial bodies (Fernel [1548] 2005, 307). Fernel holds that the multiplicity of movements of subcelestial bodies derives from the fact that the inner heavenly spheres rotate in a direction opposite to the rotation of the extreme sphere (Fernel [1548] 2005, 309). His view of celestial causation is combinatorial: the complex motions of composite bodies on earth are the result of the combination of motions of heavenly bodies. Moreover, to explain how the motion of distant heavenly bodies is communicated to composite bodies on earth and how the transmission of motion confers substantiality upon composite bodies Fernel invokes an entity called “*spiritus*” that he regards not only as a force that pervades the universe but also as a subtle, material medium (see Clericuzio 1988, 36–39; Bono 1990, 356–364; Dessi 1995; Hirai 2005, 88–96). The *spiritus* not only transmits celestial motions in a way such that composite bodies on earth would be purely passive but also transmits something of the powers of heavenly bodies to bodies on earth, such that the simple forms of composite bodies become principles of activity of their own (Fernel [1548] 2005, 359). Fernel maintains that the divine spirit “distributes itself” into the whole of a composite body and “despatches and installs the simple form into the prepared matter” (Fernel [1548] 2005, 319).

This can be seen as the relevant background for Fernel's analysis of pharmacological actions of the whole substance. Fernel's pharmacological conceptions are developed most fully in his *Therapeutics*, where he applies a variety of explanatory principles. For instance, he maintains that purgative medicament work sometimes by means of attraction by means of heat, sometimes by means of vacuity, and sometimes by means of similitude of the whole substance (Fernel 1585, 371). Thus, secondary potencies such as relaxation and attenuation, attraction, repulsion, and dissolution are given a reductionist account that points to the effect of the tempering of the elementary qualities on a body part (Fernel 1585, 388–389). Hence, in all such secondary potencies, what is causally efficient are still the tempered primary qualities. By contrast, action by means of similitude, in Fernel's view, cannot be explained in such a reductionist way: "This similitude does not belong to temperaments but to substances" (Fernel 1585, 371). Fernel compares such potencies of the whole substance with the forces of the magnet, which has "the power to actually attract iron through a celestial potency, which is beyond the elements" (Fernel 1585, 393). He claims that this kind is also the "tertiary potency" of medicaments, which "does not arise primarily and by itself from the temperament nor from matter but from the total substance of a thing and its form" (Fernel 1585, 393).

Medicaments and Emergentism

While the reduction of some (or all) pharmacological potencies to primary qualities and the alternative explanation of some pharmacological potencies through celestial causation were clearly the dominant explanatory patterns in the Renaissance, emergentism was clearly perceived as a possible third theoretical option. One context in which this becomes clear is Fernel's detailed criticism of Alexander of Aphrodisias' emergentism about medicaments and the soul (on the reception of Alexander in Renaissance philosophy of mind, see Kessler 2011). Fernel's literary figure Brutus

articulates the emergentist position of Alexander of Aphrodisias as follows:

[T]he form of a composite is a power, derived from the tempering and mingling of the bodies substrate to it; the preparation actually comes from the mingling of the substrate, and the potentiality itself, when it has attained completeness, becomes an entelechy, that is, a perfection, so as to be the form of the thing. Thus, I consider that a form develops from the potentiality of the matter, because the potentiality itself passes over into the form in an unbroken sequence, and becomes action. (Fernel [1548] 2005, 167–169)

Alexander's application of this line of thought to medicaments is made explicit when Brutus remarks about form:

[I]t appears to emerge from the temperament of the body, like a simple force originating from the temperament and concordant harmony of substrate bodies . . . [I]n this way we understand that the power of mixed theriac or of a medicated drink develops from the mingled and tempered powers of simples, and this accords with Galen's attitude too. (Fernel [1548] 2005, 175)

Fernel's literary figure here accurately represents Alexander's position. According to Alexander, the soul "is the power and form that supervenes on the blend of bodies in a particular proportion, not the proportion or composition of the blend . . . The soul . . . is not a balance, but the power [that supervenes] upon the balance: it cannot be without this balance, but is not [the same] as it" (Alexander of Aphrodisias 2008, p. 104 [*De anima* 25.2–8]; Alexander of Aphrodisias 2012, 51). As Victor Caston has argued, talk about supervenience should here be understood as amounting to the claim that mental states cannot change without a change of bodily states, thereby exactly matching the contemporary concept of supervenience (Caston 1997, 348–349). Moreover, Caston emphasizes that, for Alexander, the soul possesses causal powers that are more than the aggregates of the causal powers of the elements (*ibid.*, 349–350). Likewise, Alexander points out that some medicaments possess powers that arise from their temperament, and since this remark stems from the context of his criticism of the harmony theory of the soul, the implication again seems to be that these are powers that go

beyond the powers inherent in the harmony of elementary qualities (Alexander of Aphrodisias 2008, p. 104 [*De anima* 24.24–29]).

Fernel rejects emergentism due to two problems. The first problem could be called the “substantiality problem.” Fernel is aware that Alexander regards forms of composites as substances while at the same time regarding the forms of elements as belonging to the category of qualities (Fernel [1548] 2005, 147; see Alexander of Aphrodisias 2008, 70–72). However, Fernel’s spokesperson Eudoxus argues that Alexander faces a problem: “No accident can really accomplish the essence of a substance; in the same way, what some call the essential difference between things cannot be supplied from an accident, because an accident could not alter the essence of a natural thing” (Fernel [1548] 2005, 153). Thus, neither saying that the emerging form is a quality nor saying that a substantial form can emerge from qualities will be satisfactory. The second problem – call it the “Simplicity Problem” – is developed by juxtaposing quotations from Alexander’s treatment of elements and from his treatment of composites. On the one hand, Alexander writes: “Simple bodies which have a simple substrate, have taken on a simple form and nature. But those in which the substrate is not simple, but is already some body, or a composite: in them the form is more perfect, with more prominent and complex embellishment. And deservedly so, for the form which is in the matter and the substrate contributes something to the form of things that are composite” (Fernel [1548] 2005, 163, Alexander of Aphrodisias 2008, 74–76). On the other hand, Alexander adds a little later: “The multitude of forms, and their diverse mingling, can contribute a reasonable cause of change in substrate bodies” (Fernel [1548] 2005, 163; Alexander of Aphrodisias 2008, 76). Brutus comments on the latter passage: “Does not this say clearly that the forms of mixed bodies are themselves mixed too, and from them springs a form of the whole, to be itself composite?” (Fernel [1548] 2005, 163). Eudoxus is not satisfied: “[T]he simple form of a whole composite has to be single, and being different from the forms of the simple items and the

parts, can constrain these forms, unspoilt and intact, into a whole, though they would otherwise perish” (Fernel [1548] 2005, 165). As Eudoxus argues, a mere composite of substantial forms could not possess simplicity (Fernel [1548] 2005, 181) and therefore also could not possess new causal powers (Fernel [1548] 2005, 187).

Mercuriale adopts a different version of emergentism. He holds that the “potencies of the fourth degree” (*quartae facultates*) arise from the substantial form of medicaments (Mercuriale 1590, 20r). He ascribes to Averroes the view that “specific forms follow their own temperament, and therefore where their own temperament is weakened, also the power of the specific form is diminished, which is why, when in mixture the heat of gummi-resina is decreased by the coldness of camphor, consequently also the purgative power and what is adverse for us is decreased . . .” (Mercuriale 1590, 63r). The relevant sense of “following from” that Mercuriale has in mind is plausibly an emergentist one that involves the assumption of new causal powers since otherwise the contrast that he draws between potencies of the second and third degree that do not possess new causal powers (see above, section “[Medicaments and Reductionism](#)”) and potencies of the fourth degree would be pointless.

Perhaps the most fully articulated version of pharmacological emergentism can be found in the work of the Tübingen-based physician and natural philosopher Jacob Schegk (1511–1587). As in Avicenna’s version of emergentism, not all causal factors operative in the generation of substantial forms and their potencies in Schegk’s natural philosophy are potencies of matter. Most notably, Schegk uses the term “innate heat” (*calidum nativum*, *thermos emphytos*) to denote a kind of non-elementary heat operative in the generation of animate beings (on Schegk’s account of the generation of living beings, see Hirai 2011, chapter 3). In Schegk’s view, innate heat does not emerge from elementary qualities but rather derives from the (non-elementary) celestial bodies (Schegk 1585, 294). At the same time, he maintains that innate heat should not be regarded as the primary cause of generation but rather as one cause among others (Schegk 1540, 15r). Moreover, he does not

characterize this kind of heat as something corporeal but rather as a quality:

Because innate heat is a quality, it must necessarily inhere in its proper subject, which is that which, being of the same genus due to mixture, finally underlies the substantial form as the ultimate or proper matter. Before this heat is perfect, in ultimate matter, form will not be in it . . . Hence, simultaneously with ultimate matter the form arises and, simultaneously with it, it perishes, in such a way, however, that innate heat is a proper quality of the ultimate matter which is the proper subject of the nascent form. (Schegk 1580, sig. I5iiiiv)

Thus, innate heat for Schegk is a quality that is one of the causal factors that play a role in the emergence of forms from a suitably prepared portion of matter.

In line with such a conception, Schegk maintains that both inanimate forms and animate forms depend on the mixture of elements: “In nature, there is no essential potency, either manifest or hidden, without a natural potency or impotency that arises in natural things due to the mixture of the four elements – mixtures that are coming to be and ceasing to be as the instrumental causes of natural potencies” (Schegk 1585, 66). As he explains, “[w]e call an instrumental cause a cause due to which substances and their properties are generated and without which neither substances nor their properties can be saved from corruption” (ibid., 88). To illustrate the way in which the emergent potencies depend on matter, Schegk uses the phenomenon of plant degeneration – the process by means of which a cultivar reverts back to its corresponding wild variety. He interprets this phenomenon as an instance of species change: A change in natural potencies modifies the essential potencies of the seed and, hence, the “essential form” of the seed (ibid., 85). The relation between the instrumental causes and the essential form generated by them is characterized as a supervenience relation: the properties of forms vary with the variation of the natural potencies of the composites on which they depend.

Moreover, he characterizes the relation between instrumental causes and forms as a relation in which something substantial is generated out of something non-substantial. This becomes clear when he notes that the faculty by means of

which out of a non-substance a substance is generated as a faculty that differs from faculties that are always in the process of becoming (Schegk 1550, 144). As he expresses it, it is a faculty “that can all at once actually change and that is as a whole capable of exercising its whole activity without motion” (ibid., 143). This implies that something genuinely new is generated. Moreover, in contrast to ordinary changes that take place successively, the generation of substantial forms here is described as a momentary event. The emergence relation thereby is characterized as an instance of synchronic material causation.

Schegk also considers the role of the emergent forms and their potencies in downward causation. He maintains that the temperament of the mixture determines the substantial form, which in turn determines the further accidents that belong to the natural thing (Schegk 1585, 26). In particular, diachronic downward causation is described as being relevant for the generation of plant-based medicaments that act by their whole substance. In the first instance, downward causation affects the temperament of elementary qualities: “The soul of rhubarb is the cause of proper and ordinary proportions of elementary qualities without which rhubarb could not have its forces and potencies” (ibid., 89). But given the potency of the temperament of generating substantial forms, this change of temperament also can bring with it the generation of the substantial form of a plant part. Thus, the juice of rhubarb “receives its form from the soul and can subsist without the soul” (ibid., 90). This is why such medicaments act by their whole substance: “Forms are the causes and instruments of the preparation of elementary qualities, such that faculties arise in them when they change our body with respect to entelechy . . .” (ibid., 29). For example, water-hemp and absinth do not make our body dry and hot not because they are dry and hot but because they have a potency that derives from their substantial form that constitutes their essence (ibid., 30). Moreover, as he explains, when the soul produces posterior and perfect forms in similar parts, the previous forms of these parts are thereby not abolished. Rather, the posterior form existentially depends on the previous forms such that, if the previous forms were

abolished, the more perfect form would perish as well. This is what Schegk has in mind when he says that the previous forms stand in the relation of mediate matter to the perfect forms (ibid., 42). Diachronic downward causation therefore is described as a process of perfection of previously existing forms (ibid., 43).

Finally, this conception of a circle of causation is used to explain why the prior forms persist when the posterior forms are destroyed: even if the posterior forms are required for the changes in the physiology from which the modifications of the prior forms emerge, these modifications persist as long as their physiological basis persists (ibid., 44). In particular, this applies to the pharmacological powers of plant parts: even when the vegetative soul perishes, the substantial forms of the parts of the plant can persist (ibid., 45). Emergent plant souls thus are understood as one of the causal factors that, through downward causation upon their material substrate, lead to the emergence of the substantial forms of plant parts that can survive the death of the plant and that explain the powers of medicaments that act by their whole substance.

Abstract

Joseph Philagrios was a Byzantine scholar of the fourteenth century from Crete who wrote against the rapprochement between the Greek Orthodox Church and the Catholic Church. He was also a copyist of manuscripts.

Synonyms

[Philagres](#)

Biography

Joseph Philagrios was born in Crete when the island was under the Venetian occupation. His original name was John. He studied rhetoric,

logic, and ethics probably in the Pandidakterion at Constantinople. Although he had a strong interest in Aristotelian philosophy, he studied Plato, Porphyry, Antisthenes, Philoponus, and Ammonius. After his studies, Philagrios returned to Crete. For a short period of time, he stayed in Candia and opposed the Venetian authorities on religious issues. Then he moved to Mount Cophinas, south of Candia, where he built the monastery of the Three Holy Hierarchs. In the monastery, he incorporated a school for religious and secular education. His reputation as a scholar and teacher led a lot of students to the monastery, where Philagrios taught philosophy, theology, grammar, medicine, and astronomy. In addition, he created a scriptorium. His students and associates copied ancient codices and he personally wrote the marginalia. After his death, the school declined and was finally closed down. Philagres got engaged in the intense debate between Greek Orthodox and supporters of the Latin Church, which tormented the Greek-speaking regions in the fourteenth and fifteenth centuries. He blamed Demetrius Cydones and Emmanuel Calecas for their positions concerning the union of the two Churches. Philagrios worked together with Joseph Vryenios, Neilos Damilas, and Anthemos, the bishop of Athens, in order to repel the offensiveness of the pro-Latin party. His oration “Against the Latins” (*Ὁ κατὰ τῶν Λατίνων δικανικός*) comprises in an excellent manner the basic arguments of the Byzantine polemical literature. Calecas replied and accused Philagrios that he was ignorant and “blind,” thus blinding his students. In addition to the religious texts, Philagrios produced commentaries on the works of Aristotle, especially the *Categories*.

Impact and Legacy

For many centuries, most of his works had been attributed to Marcus Eugenicos. Philagrios’ work is best preserved in a manuscript, which is been kept in the *Angelicum* Library in Rome. In addition, his works are included in codices

that are preserved in Bucharest, Paris, Brussels, and the Greek island of Andros.

Abstract

Philology (from the ancient Greek φίλος “love” and λόγος “word”) is a branch of literary criticism that studies languages in written sources. Classical philology is concerned with the study of literary texts written in Latin and ancient Greek and originated in the libraries of Alexandria in the fourth century BCE. After a marked blossoming in the first century, this discipline suffered a slow but unstoppable process of decay throughout late antiquity and Middle Ages. Italian scholars in the late thirteenth century resumed this critical approach and sharpened its tools. By the beginning of the sixteenth century, they had many emended editions of ancient texts previously thought to be lost and helped make them available to European scholars (see Contini 1977; Pasquali 1920, 1934; Peck 1911; Reynolds and Wilson 1968; Timpanaro 1963; Turner 2014).

Heritage and Rupture with the Tradition

A restricted circle of intellectuals who gathered in Padua in the second half of the thirteenth century showed an unprecedented interest in classical poetry and actively contributed to the rediscovery of such neglected literary genres as tragedy (see Billanovich 1953, 1976, 1985, 1990, 2002; Hyde

1966; Novati 1922; Sambin 1952; Weiss 1970; Witt 2000). Among these prehumanists, the jurist Lovato Lovati (1241–1309) played the most pre-eminent role (see Collodo 1985; Polizzi 1985; Kohl 2006; Weiss 1970; Witt 2000). Lovati's poetic talent, best demonstrated in his *Epistole metriche*, did not earn him a place among the Three Crowns nor among the future generations of humanists. Nevertheless, Lovato's frequent quotations of classical texts testify to his familiarity with Horace's *Odes*, Statius' *Silvae*, Tibullus's poems, and Lucretius's *De Rerum Natura* 150 years before Poggio Bracciolini claimed the rediscovery of this text. Another intellectual from Padua shared with Lovato this same passion for the Classical world: Geremia da Montagnone (ca. 1255–1321). Unlike Lovato, Geremia never composed verses and remained a devoted jurist. His *Compendium Moraliū Notabilium*, however, demonstrates a marked familiarity with Catullus, Martial, and many texts thought to be lost, including Ovid's *Ibis* and Seneca's tragedies (see Bologna 1986; Ullman 1973; Marangon 1977). The *Compendium*, a massive work in 25 books, comprises five sections (*De religione*, *De iustitia*, *De prudentia*, *De temperantia et voluptatibus*, and *De solitudine*), each of which includes a vast collection of quotations from not only biblical and classical texts, but also patristic and medieval sources, listed in chronological order. The most remarkable feature of this otherwise dry list is the distinction Geremia draws between classical and medieval writers. The author refers to the former as *poetae* and the latter as *versilogi*. Such a deliberately contrasting classification shows Geremia's awareness of a clear discontinuity between classical antiquity and the Middle Ages, identifying the latter as a period of political, moral, and artistic decay (see Milan 2000; Weiss 1949, 1966). A more organic study of Seneca's tragic production was pursued by the third representative of the early Paduan Humanism. Like his contemporary Geremia, Albertino Mussato (1262–1329) was also a jurist in Padua. Mussato's fame as passionate classicist, however, has earned him a lasting reputation as a refined

man of letters (see Arnaldi 1980; Billanovich 1976; Bortolami 1985; Di Salvo 2000; Gianola 2004; Hyde 1966; Minoia 1884; Zabbia 2012; Zardo 1884). The influence of ancient Latin sources, especially historians, can already be traced in his early *Historiae* – patterned upon Livy and Sallust – but Mussato's major literary success was the drama *Ecerinis*, published in 1315. This tragedy represents the rebirth of a literary genre absent throughout the Middle Ages and was largely due to an attentive study of Seneca's dramas. Both its metric form and content are borrowed from the Latin dramatist: *Ecerinis* employs an iambic trimeter and warns against the unfettered authority of monarchs. This successful play recounts the rise and fall of Padua's tyrant, Ezzelino III da Romano, and in December 1315 its author was crowned as a poet laureate in an ancient ritual last performed in the first century AD.

In spite of Italy's political fragmentation, Paduan humanism spread beyond the city's territories to the neighboring towns of Vicenza and Verona, where the jurist Benvenuto Campesani (1255–1323) contributed to the rediscovery of Catullus (see Gloria 1884; Gorni 1974; Sabbadini 1885, 1905; Weiss 1955). In his *De Resurrectione Catulli* – three Latin elegiac distichs meant to prelude to the original *Carmina* – Campesani adopts a first-person narration and celebrates Catullus' long-awaited return to his homeland. The capitular library in Verona held a rare, ninth-century manuscript of the *Historia Augusta* that allowed Giovanni de Matociis (+1337) to compose his *Historia Imperialis*, a detailed chronicle of emperors' lives, from Augustus to Henry VII (see Adami 1982; Avesani 1976; Zabbia 1999, 2008). Although this ambitious project was left incomplete upon Giovanni de Matociis' early death, it is a first foray into applying ancient historiography to modern politics. Although the *Historia* is strongly influenced by Livy, Sallust, and Nepos, it also draws extensively from such medieval sources as Paul the Deacon, Isidore of Seville, Goffrey of Viterbo, and Richard of Poiriers. The result is not a mere chronological list of

events, but an accurate historical account with an unprecedented interest both in rhetorical elaboration and philologically reliable sources. The only philological work published during his lifetime, *Bevis Adnotatio De Duobus Pliniis*, argues that the same author did not write both *Panegyric* and *Naturalis Historia*. Giovanni was indeed able to identify the works of Pliny the Elder and Pliny the Younger based on the criteria of content, style, and chronology (see Weiss 1966).

This prehumanistic contribution to the development of philology as a literary discipline has been the object of a thorough and organic academic study leading to a complete reassessment of the pioneering role played by the Paduan humanists. The teachings of Lovati, Mussato, Campesani, and De Matociis quickly spread out throughout the peninsula, but it was in Tuscany that they found the most fertile soil thanks to Francesco Petrarca (1304–1374). No fourteenth-century intellectual was a more imposing and influencing poet as well as classicist (see Billanovich 1947a, b, 1996, 2008; Capelli 2013; Contini 1970; Dotti 1968, 1987; Rico 2015; Santagata 2004; Wilkins 1951a, b, 1955, 1959, 1961). Petrarca's life coincided with the Avignon Papacy (1309–1377). The French papal court fostered unprecedented cultural exchange between north and south of Europe and brought together eminent intellectuals of diverse nationalities, interests, and backgrounds. In 1329, Petrarca edited a thirteenth-century manuscript (London, Brit. Libr. *Harleianus* 2493) integrating the preserved third decade of Livy's *Historiae* with the first and fourth. His edition of Livy was based upon a strict collation of manuscripts, and the constant search for ancient Latin texts resulted in not only the richest library in West since the fall of Rome, but also in a more complete record for the study of Latin historiography. Cicero, in particular, attracted the attention of the young Italian scholar. Petrarca's corpus and influence span many literary genres, from oratory – with the *Pro Archia*, discovered in Liege in 1333 – to the *Epistulae ad Atticum* – found in the Cathedral Library of Verona in 1345. Cicero and Seneca's served as literary

models for his own Latin *classical* style, and he addressed in his own letters both to contemporaries as well as to ancient authors, whom he presented as rediscovered after the “Dark Ages.” Petrarca's library included a rare copy of Virgil's *Opera omnia* (including the *Aeneid*, *Bucolics*, and *Georgics*) and conducted an extensive commentary on these texts. Petrarca's interest in the Latin poet, as testified by the *Ambrosian Virgil*, lay not only in the text's philological accuracy, but also reflected a new conception of the manuscript as a precious and unique piece of art. The *Ambrosian's* frontispiece, indeed, bears a beautifully painted miniature by Simone Martini. Petrarca's critical approach to Latin texts was pursued by Giovanni Boccaccio (1313–1375) – who strongly pushed for the hiring of Leontius Pilatus as professor of Greek language and literature at the Florentine *Studio* in 1360 (see Branca 1956; Candido 2014; Cronin 1967).

Coluccio Salutati (1331–1406), however, was Petrarca's greatest philological inheritor (see Baron 1955, 1988; Garin 1961, 1966; Stocchi 2014; Tanturli 2010; Ullman 1963). During his time as Chancellor in early fifteenth-century Florence, Salutati gathered such distinguished scholars as Leonardo Bruni, Niccolò Niccoli, and Poggio Bracciolini to Tuscany (see Ruini 2007). Salutati was a passionate bibliophile and a collector of ancient texts; scholars believe his library included as many as 100 volumes. The most noteworthy manuscripts in the collection were Ambr. R. 26 sup. – the oldest manuscript of Tibullus' poems – Vat. Ottob. Lat. 1829 – Catullus' poems – and a copy of Cicero's *Ad familiares*. This last manuscript's discovery in the Cathedral library of Vercelli was Salutati's greatest literary find, and made him the first European scholar in centuries to possess both collections of Cicero's letters (*Ad familiares* and, later on, the *Epistulae ad Atticum*). Salutati's transcription of these epistolary collections can be found in the Laur. 49.7 and 49.18. See Fiesoli (2010). Although not himself learned in ancient Greek, the Chancellor followed up on Boccaccio's efforts to attract to Florence the most eminent Greek scholars of Byzantium (see

Monfasani 2015; Wilson 2016). The hiring of Manuel Chrysoloras by the Florentine *Studio* in 1397 was largely due to Salutati's perseverance. Through his efforts, many of the second generation of Florentine humanists received an education in Greek (see Gentile 2010; Monfasani 1995).

Among the humanists fostered by Salutati, Poggio Bracciolini (1380–1459) was the greatest discoverer of ancient literary texts (see Baron 1966, 1968; Bigi 1971; Garin 1952, 1961; Saitta 1949; Tateo 1967). As a Papal secretary, Poggio traveled with the Curia to the Council of Constance (1414–1417) and interacted with some of the most illustrious European scholars of his time. While the Council was in session, Poggio traveled throughout Europe, and on a mission to Cluny in 1415, found a manuscript containing five of Cicero's orations, two of which – *Pro Roscio* and *Pro Murena* – had long been thought lost. This manuscript, the *Vetus Cluniacensis*, is no longer extant, but was copied by Nicolas de Clamange (Par. Lat. 14749). In 1416, while in St. Gall, Switzerland, Poggio discovered a manuscript containing the first four books of Flaccus' *Argonauts*. Although this manuscript is also no longer extant, its content survives in a copy made by the humanist himself (Madrid, Bibl. Nac. 8514). With the help of Bartolomeo da Montepulciano, Poggio also brought back to Italy manuscripts with texts of Lucretius, Silius Italicus, Ammianus Marcellinus, and Statius' *Silvae* (Madrid, Bibl. Nac. 3678). While the ninth-century Carolingian text of Ammianus' *Res Gestae* (Vat. Lat. 1873) still remains the sole existing document bearing this text, the exemplars of Lucretius and Silius went lost. Poggio's copy of Lucretius generated the family of *Itali* manuscripts, and the modern critical edition of Silius' *Punica* relies on his copy. Another seven of Cicero's orations were found in Cologne and carefully transcribed (Vat. Lat. 11458), as well as a complete copy of Petronius' *Cena Trimalchionis*. The modern *stemma codicum* of this text relies on manuscript Par. Lat. 7989, which bears Poggio's signature (see Fiesoli 2013; Foffano 1969; Sabbadini 1905).

By the mid-fifteenth century, the vast majority of Latin literary texts known today had been

found and transcribed. In 1421, Gerardo Landriani located and transcribed a collection of Cicero's rhetorical works that included *De oratore*, *Orator*, and *Brutus* in the Cathedral of Lodi (Vat. Ottob. Lat. 1592). Eight years later, in 1429, Nicholas of Cusa brought an eleventh-century German manuscript (Vat. Lat. 3870) of Plautus' twelve once-list comedies to Rome.

These discoveries coincided with a flourishing of such literary disciplines as textual criticism and philology. Two Italian scholars, Lorenzo Valla (1407–1457) and Angelo Poliziano (1454–1494) played a central role in the advancement of philological studies. Their success was the result not only of a rare talent for ancient languages, but also of a growing number of libraries accessible to men of letters. The libraries founded by the Medici in Florence, Pope Nicholas V in Rome, and Alfonso V in Naples offered a fruitful working environment for scholars. Valla wrote most of his philological works in the Royal Library of Naples, not the least of which being a daring criticism of the *Donation of Constantine* completed in 1440 (see Antonazzi 1985; Camporeale 1972; Gaeta 1955; Garin 1986; Lanfranchi 1999; Regoliosi 2006, 2007). In this treatise, Valla identified several anachronisms and contradictions both in the *Donation's* form and content and declared the text's many barbarisms incontestable proof that the document was a forgery. This fundamental step in the history of philology also undermined any attempt on the papal part to claim political authority. Valla also composed the *Elegantiae Linguae Latinae*, a handbook of Latin language and style demonstrating an unprecedented study of Latin genres and authors (see Regoliosi 2000). From 1446 to 1447, he emended books XXI–XXVI of Livy's *Ab Urbe Condita* and employed his critical skills to rebut many emendations suggested by Bartolomeo Facio and Antonio Beccadelli.

Angelo Ambrogini (better known by the toponymic Poliziano) was fostered by Florentine patronage and was both an intimate friend of Lorenzo il Magnifico and tutor to his son, Piero (see Bausi 2011; Bigi 1960; Branca 1983; De Sanctis 1912; Orvieto 2009; Rizzo 2002; Viti 2011a, b). Poliziano's *Miscellanea* is a collection

of a hundred essays on different topics. The first section (*Centuria prima*) was published in 1489 and shows a level of accuracy in emending manuscripts unmatched until Lachmann's work in the nineteenth century (see Viti 2012). In *Misc.* XVIII, the Italian scholar observes that the manuscript Laur. 49, 7 containing Cicero's *Epistulae ad Familiares* penned by Salutati in 1392, was a copy of an existing and more ancient manuscript (Laur. 49, 9). This comment introduced the principle of *eliminatio codicum descriptorum* in textual criticism, a methodology that not only employed a close and analytical reading of the text, but also a comparative analysis of all of its surviving versions, both complete and fragmentary. To accurately reconstruct a lost text, a scholar relied on as many *lectiones* as possible in order to follow an objective parameter of analysis (see Perosa 2000; Viti 1996, 2014). This still embryonic *collatio codicum* allowed scholars to identify the origin of a text as well as the interrelationship of extant manuscripts (*stemma codicum*).

The invention of the printing press and the subsequent spread of literary *monumenta* allowed Poliziano to study, emend, and comment upon a vaster number of ancient authors, including many unfamiliar texts, such as Galen's *De Compositione Medicamentorum* (Laur. 75, 17), Pelagonius' *Ars Veterinaria* (Riccard. 1179, a handwritten copy by Poliziano himself taken from a now-lost incunabula), and Pliny the Elder's *Naturalis Historia* (1473). Although mainly known for his Latin and Italian poetical production, Poliziano was also a refined Hellenist, and his detailed knowledge of the vast majority of Greek texts available at his time allowed him to use his linguistic skills to cross-analyze manuscripts for philological purposes (see Pontani 2002). An emblematic example of this innovative analytic technique is the employment of Callimachus to emend a corrupted passage in Catullus (*Misc.* 66, 48).

By the later fifteenth century, Greek philology had become an academic discipline in Italy, thanks largely to the influence of Cardinal Basilios Bessarion (1400–1472), whose library contained more than 500 texts between Greek manuscripts and modern editions personally edited by the Cardinal himself (see Bianca 1999;

Geanakoplos 1962; Harris 1995; Monfasani 2011). Bessarion had fled Constantinople with as many Greek texts as he could manage while the Ottoman Turks were advancing on the city. Because of its long and strong ties to Byzantine commerce and politics, the Republic of Venice was the natural landing place for businessmen, traders, and scholars, fleeing the Ottomans with their families and treasures. Bessarion endowed the Republic with his monumental library, the seed donation for the future *Biblioteca Marciana* (see Labowsky 1979; Zorzi 1987). Bessarion also conducted a cross-analysis of Latin and Greek texts, and amended and partly rewrote Wilhelm of Moerbeke's translation of Aristotle's *Metaphysics*. He also completed the first Latin translation of St. Basil's *Theophania*. In a brief pamphlet, *In Illud Vangelii: Sic Eum Volo Manere*, Bessarion argued about St. Jerome's Latin translation of *John* 21: 22 and after a compared reading of the texts, pointed out that the Greek conjunction ἐάν had been erroneously misspelled in *sic* instead of *si* (see Linde 2012; Wilson 2016). Such an unprecedented critical understanding of classical texts granted Bessarion a high degree of resentment among his fellow scholars – as in the case of George of Trebizond – and admiration; Valla called him *inter graecos latinissimus inter latinos graecissimus* (see Monfasani 2012; Wilson 2016). Bessarion's *In Illud* not only contributed to the development of linguistic philology in the Renaissance, it also showed that a scholar had the authority to apply linguistic criteria even to texts considered untouchable such as the Holy Scriptures.

Cardinal Bessarion's pamphlet, *In Illud*, paved the way for Desiderius Erasmus' (ca. 1469–1536) critical edition of the New Testament based on the original Greek text (see Bietenholz 2009; Christ-von Wedel 2013; Huizinga 1984). Erasmus' intention to philologically approach religious texts had become clear as soon as 1505, when he edited Valla's *Adnotationes in Novum Testamentum*. His need, as a Christian believer, to retrieve the original teaching of Christ laid at the bottom of his project to publish the Greek critical edition of the New Testament based on criteria of utmost philological rigor (see McDonald 2016). *Novum*

Instrumentum Omne was first published by Johann Froben in Basel in 1516 and enjoyed a vast success. There were four subsequent editions in 20 years (1519, 1522, 1527, 1536), and Erasmus' work served as a model for both Luther's German (1519) and Tyndale's English (1522) translations. This groundbreaking face-page, critical edition and Erasmus' methodology were both harshly criticized. The Dutch scholar had indeed based his analysis on only a few manuscripts: three versions of the Gospels and Acts, four versions of the Pauline epistles, and one manuscript of the Book of Revelation (see Olin 1979; Rummel 1986; Visser 2011). Yet, Erasmus' work brought Valla and Bessarion's efforts to their logical conclusion by applying the tools of critical textual analysis to sacred as well as secular texts. The figures of the Protestant Reformation applied these philological lessons to their arguments against Papal hierarchy, and the Catholic Church eventually responded in kind. Agostino Steuco's (1497–1548) *Contra Laurentium Vallam, De Falsa Donatione Constantini Libri Duo*, published in 1547, rebutted Valla's claims with his own discovery of Greek antecedents and provided the first draft of a *stemma codicum* of the Donation (see Graziosi 1974; Delph 1992, 1994, 2008). Steuco's *Contra Vallam* inherited Poliziano's teaching and applied his *collatio codicum* to question the validity of Valla's approach and support Papal secular authority (see Delph 1996).

Philosophia Perennis

Pier Davide Accendere
Humanities Department, University of Eastern
Piedmont "Amedeo Avogadro", Vercelli, Italy

Abstract

"Philosophia perennis" (Perennial philosophy) is a popular philosophical phrase and has its origin in Agostino Steuco's *De perenni philosophia* (1540). In his important essay titled *Perennial Philosophy: From Agostino Steuco to Leibniz* (1966), Charles B. Schmitt illustrates the sources, impact, and legacy of this complex concept from Agostino Steuco (1497/1498–1548) to Gottfried Wilhelm Leibniz (1646–1716). Whereas Schmitt's research is to this day a fundamental tool for fully understanding Perennial Philosophy's historical and philosophical meaning, equally important is the recent monograph by Wilhelm Schmidt-Biggemann titled *Philosophia perennis: Historical Outlines of Western Spirituality in Ancient, Medieval and Early Modern Thought* (2004).

Agostino Steuco's Perennial Philosophy Prodrômes: Marsilio Ficino and Giovanni Pico della Mirandola

Marsilio Ficino (1433–1499) and Giovanni Pico della Mirandola (1463–1494) were the most significant philosophical predecessors of Steuco's conception. On the one hand, we refer to the Ficinian notion of a *prisca theologia* as *pia philosophia* and, on the other hand, to the Pichian universal harmony (*concordia*) and *pax philosophica* (philosophical peace).

Beyond a doubt, "one of the most important facts with regard to Ficino's revival of Platonism was his connection of the Platonic tradition with a supposedly earlier tradition of 'pre-Platonism' to which he gave the name, *prisca theologia*" (Schmitt 1972: ix; cf. Schmitt 1970; Gentile 2012). This theory asserts that the original wisdom, theological and philosophical at the same time, was revealed before the advent of Greek philosophy. Indeed, Ficino presents a genealogy of six *prisca theologi*: Zoroaster, Hermes Trismegistus, Orpheus, Aglaophemus, Pythagoras, and Plato: "in those things which pertain to theology the six great theologians of former times concur. Of whom the first is said to have been Zoroaster, head of the *magi*; the second is Hermes Trismegistus, originator of the priests of Egypt. Orpheus succeeded Hermes. Aglaophemus was initiated into the sacred things of Orpheus. Pythagoras succeeded Aglaophemus in theology. To Pythagoras succeeded Plato, who in his writings encompassed those men's universal wisdom, added to it, and elucidated it" (Schmitt 1966: 508).

The primal *sapientia* from Zoroaster reached its highest expression with divine Plato and came to its admirable crowning with Christianity. The Florentine philosopher writes: "the ancient theology of the Gentiles, into which Zoroaster, Mercury, Orpheus, Aglaophemus, and Pythagoras converged, is completely preserved in the writings of our Plato. In his *Epistles*, Plato announced the mysteries that finally after many centuries were going to be revealed to men. This happened when, at the time of Philo and Numenius, for the first time the meaning of the primitive theologians began to be understood from the pages of the

Platonists. This too came about after the writings and the speeches of the Apostles and their disciples. The Platonists in fact took advantage of the *divine* light of the Christians to understand the *divine* Plato. After this, Basil the Great and Augustine demonstrated that the Platonists usurped the mysteries of John the Evangelist. I as well discovered with absolute certainty that the more profound mysteries of Numenius, Philo, Plotinus, Iamblichus, and Proclus, were derived from Paul, Hierotheus, and Dionysius the Areopagite. From these last ones, Numenius and the others usurped all that of an admirable splendor they wrote concerning the divine mind, the angels, and other theological arguments” (Garin 2008: 244).

The ancient theologian’s thought is a *docta religio* (learned religion), and so it is a *pia quaedam philosophia* (cf. Schmitt 1966: 509). According to the Ficinian’s perspective, it seems clear that the ancient theology and the philosophical magisterium are “sisters,” in other words complementary aspects of a common heritage: there is a basic agreement between philosophy and religion and that many elements of pagan thought can be accommodated to Christianity (cf. Schmitt 1972: ix). This basic concordance, a distinctive characteristic of Ficinian’s syncretism, is embodied in two precise historical forms: Platonism (true philosophy which anticipates some aspects of Christian theology) and Christianity (true theology), both supreme expressions of the one and only truth. Ficino “pursued the idea of a Christian Platonism [...]. He gave an exact account of why Christian theology can and should use Platonic reasoning, and developed a theory about the history of revelation in antiquity which allowed him to presume a divine origin for Platonic philosophy, and which served as an historical argument to demonstrate the affinity of Christianity with Platonism. One of the most important results of this is the way in which Ficino tried to abolish the separation between religion and philosophy with his programme of *docta religio* and *pia philosophia*” (Lauster 2002: 45).

Giovanni Pico della Mirandola (1463–1494) enlarges the Ficinian proposal, planning the ambitious project of a universal unity (*concordia*) between different philosophical epiphanies of the

truth, “but convergent in their affirmation of a single universal truth” (Pirillo 2014: 264; cf. Granada 2002). The truth is not exclusive property of some particular traditions, but of all traditions. In this respect, Pico’s universalistic vision opposes the Ficinian emphatic predilection for Platonism and Christianity, both privileged sources of truth. “Ficino’s *prisci theologi* have no special access to truth, but aspects of it are to be found in Averroës, the *Koran*, the Cabala, the writings of the medieval schoolmen, and in many other places as well” (Schmitt 1966: 513).

In addition, Pico integrates the Ficinian’s paradigm: According to the Count of Concord, not only is Aristotle a full part of the *prisca theologia*, but there is also harmony between Plato and the Stagirite. Ficino, by contrast, excludes Aristotle from the genealogy of the ancient theologians, in the footsteps of which he merely follows. Aristotle is a natural philosopher, (*physicus*) and so his research regards nature and not divine principle (cf. Granada 2002: 229–230). In the *Platonic Theology* (book VI, chap. II), Ficino writes: “the ancient theologians teach us this: Zoroaster, Mercury, Orpheus, Aglaophemus, Pythagoras, and Plato, whose footsteps Aristotle, the natural philosopher, for the most part follows” (Ficino 2002: 125, 127). By virtue of these Ficinian integrations, Ficino’s program becomes a truly universal *concordia* or harmony (cf. Granada 2002: 230).

Steuco’s *De perenni philosophia*

As is well known, “Philosophia perennis” (Perennial philosophy) is a popular philosophical phrase and has its origin in Agostino Steuco’s *De perenni philosophia* (1540) (cf. Di Napoli 1967; Steuchus 1972; Vasoli 1983–1984; Crociata 1987; Granada 1994). This phrase designates the true philosophy which exists “even from the beginning of the human species” (Schmitt 1966: 522). There is only one original truth and wisdom, revealed by God to all humanity and transmitted in different forms from generation to generation in a perfect historical continuity. The primeval unity and fullness of this knowledge are called “the

universal agreement” or “perennial philosophy” (Schmitt 1966: 522; cf. Muccillo 1988).

This primal wisdom, transmitted from ancient times to later centuries, is older than Greek philosophy. The original truth had its roots in Adam and in his progeny: “Wisdom was accumulated and complete in the first men. This is clearly proved by the fact that they recognised themselves, when they were born, to have been created by God, and that shortly before all had been created by him: heaven and earth and sea had been made from nothing, as well as animals, stars, and the seeds of the field. After their birth they had the fruitful experience of divine presence, and conversation with Him. Everything that happened from the time before their creation until their expulsion from paradise was miraculously known to Adam. So it is no accident that they did not transmit the memory of all this to their progeny. But it is also not probable that the first man forgot his and the world’s origin, and that he did not preach this to his sons wisely and in a loud voice” (Schmidt-Biggemann 2004: 429).

According to Steuco’s historical genealogy of the original truth, Adam’s knowledge was inherited by Methuselah, Noah, and then Abraham. This common and precious heritage, “during the following barbaric centuries, lost its certainty and firmness which it had among the first men and became worse in its old age. [...] Since, after the human race’s dissemination and scattering into all parts of the world there remained only people who lived far apart and who intended to recognise solely what was necessary for their lives, it happened necessarily that they neglected their memories which therefore remained restricted to a few people” (Schmidt-Biggemann 2004: 430).

In spite of this condition of decadence and oblivion of the original wisdom, “the nations that originated first, and in whose lands was born and developed the history of the ancients, preserved more than other nations clearer and more authentic vestiges of those events. I am speaking of Chaldeans, Armenians, Babylonians, Egyptians, and Phoenicians. It is among these peoples

that the Theology of the Ancients can be found partly clear and manifest, partly mixed with fables and intricate, and partly corrupted by impious figments” (Garin 2008: 399–400). Among these ancient nations, in Steuco’s *Philosophia perennis*, Chaldeans and Egyptians are of great relevance in the historical transmission of the original and eternal *sapientia*. Indeed, “the Greek philosophers adopted the core of Chaldean and Egyptian philosophy as derived from Noah and explicated it as a science of the highest principle” (Schmidt-Biggemann 2004: 433).

So the ancient revelation of the unique truth arrives to Greek philosophy, and it finds its major depositaries in the divine Plato and in his Neoplatonic followers (Plotinus, Proclus). Eventually, the philosophical itinerary of the ancient wisdom has its culmination in Christian theology. Moreover, Steuco in his work reasserts a principle of Neoplatonic inspiration: the philosophical tradition is indistinguishable from religion. The true and perfect end of philosophy is piety and contemplation of God. More importantly, in specific sections of the *De perenni philosophia* Steuco wants to show the indubitable conformity of Christian doctrine and philosophical speculation: “the Trinity (I-II; 1-122); what he calls *De tota divinitate* (III; 123-165); the thesis that Aristotle (IV; 166-207), Plato (V; 208-236), and the later Greek and Roman philosophers (VI; 237-278) were all monotheists; the creation of the world (VII; 279-411); the good and evil angels (VIII; 412-489); the creation of man and the immortality of the soul (IX; 490-560); and the end of man consisting in piety (X; 561-619)” (Schmitt 1972: x). In his search for a “clearer notion of God” (Schmitt 1966: 519) and a general agreement between philosophy and Christianity, Steuco has a preference for the *divinus* Plato: “But in the range of talents, greater is Plato than Aristotle, who delighted more in the study of lower things and those things known by the senses and left the study of the hidden things, surpassing human abilities, the mysteries of the ancients, and the secrets of God to Plato and others” (Schmitt 1966: 519).

In truth's historical development, Steuco recognizes a constitutive continuity. Notwithstanding phases of rupture, degradation, or oblivion, the original wisdom preserves its essential unity. About its rediscovery, Steuco highlights three crucial periods: "The first was the blossoming and strong age of youth, which, when it came into the age of senility, began to be reborn and renewed in the second age of the philosophers. In the most recent times, philosophy was not only reborn, but became greater and more splendid than it ever was. Its light grows and shines as much as the spirits can grasp it" (Schmidt-Biggemann 2004: 434). According to Steuco's interpretation, in philosophy's history, from the *prima saecula* until modern age, there is no progress or acquisition of newness. Indeed, both reality and human knowledge find their origin in God. Hence, human reason's progress is understood as preserving a primitive sapiential patrimony (cf. Muccillo 1988: 60). In conclusion, "in Steuco [...] history flows like time, it knows not 'dark ages' and 'revivals'. There is but a single truth that pervades all historical periods. It is perhaps not equally well-known in all periods, but it is accessible to those who search for it. True theology, for example, is nothing other than the revealed truth which has been known to mankind from the earliest times. [...] this view of history serves almost as a prerequisite for his over-all interpretation of the *philosophia perennis*" (Schmitt 1966: 518).

Perennial Philosophy's Impact and Legacy

In the sixteenth and seventeenth centuries, the *De perenni philosophia* was highly praised: In one of his major works, Francesco Patrizi of Cherso (1529–1597) explicitly quotes the expression "perennis quaedam philosophia" (*Nova de universis philosophia*, 1591, *Panarchia*, Pars II, Liber XVII, 38v); Kasper von Barth (1587–1658) calls it a "golden book," and Daniel Georg Morhof (1639–1691) refers to it as an "opus

admirabile" (Schmitt 1966: 516–517). However, the work also had many critical readers: Benito Pereira (1535–1610), Giambattista Crispo (1550–1595), Denis Petau (1583–1652), Gerardus Johannes Vossius (1577–1649), Richard Simon (1638–1712), and Johannes Matthaeus Gesner (1691–1761).

According to Pereira, Steuco's positions were "not only false, but even most absurd and completely inconsistent with Christian teaching" (Schmitt 1966: 525). Giambattista Crispo, a little-known Italian thinker native of Gallipoli, in his *De ethnicis caute legendis* (1594), "criticizes 'that celebrated writer on perennial philosophy' (*celebrem illum de perenni philosophia scriptorem*) for comparing Moses to Plato: 'Steuco's odious comparison' (*odiosa Eugubini comparatio*)" (Schmitt 1966: 526). Petau, following Pereira's objections, asserts that the agreement to the Platonism with Christian tradition is theologically unacceptable. Johannes Vossius, theologian and philologist, condemns Steuco's idea that the ancient pagan religion were in profound agreement with Christianity: "he charges Steuco with twisting Plato's words to make them agree with Christian teaching. Vossius can see no connection between the teachings of the *prisca theologi* and Christianity, and concludes that no one who knows Plato well could agree with Steuco's interpretation" (Schmitt 1966: 527). Richard Simon remarks upon Steuco's excessive dependency on the *prisca theologia* and his misinterpretation. Finally, Gesner "found Steuco, along with Psellus and Ficino, to have erroneously held that religious truths may be known without actual access to the Scriptures" (Schmitt 1966: 527).

Conversely, in the syncretistic branch of sixteenth-century philosophy, Steuco's work met the favor of many interpreters. For example, Guillaume Postel (1510–1581) mentioned the *De perenni philosophia* in his *De rationibus Spiritus Sancti* (1543). In the prefatory letter to his translation *Libri de plantis falso Aristoteli attributi* (1556), Julius Caesar Scaliger (1484–1558) calls Steuco "a divine man and easily a prince of true literature" (Schmitt 1966: 528). In his *Platonis cum Aristotele in universa philosophia comparatio*

(1573), Jacques Charpentier (1524–1574) was looking for material in support of his belief that Platonism and Christianity can be reconciled. In doing so, he cited Steuco as evidence that this goal could be achieved (cf. Schmitt 1966: 528). Paul Scalichius (1534–1574) in *De iustitia aeterna seu de vera promissione gradatio* (1559) and Muzio Pansa (1560–1640) in *De osculo seu consensu ethicae et Christianae philosophiae tractatus* (1605) were profoundly influenced by Steuco's philosophical thought. In particular, "Pansa's work is essentially an early XVIIth-century reiteration of the principles of perennial philosophy" (Schmitt 1966: 529).

Lastly, in this long historical tradition, we get to Gottfried Wilhelm Leibniz (1646–1716). As Charles B. Schmitt claims in his fundamental study titled *Perennial Philosophy: From Agostino Steuco to Leibniz* (1966), "Leibniz knew Steuco well [...] and traces of his influence can be found throughout Leibniz's writings" (Schmitt 1966: 531). Thus, Leibniz "was not the originator of the notion of *philosophia perennis*," although he "was the first to speak of *philosophia perennis* without specifically referring to Steuco as the author of the notion. [...] From this time onward the connection of 'perennial philosophy' with the theologian from Gubbio was often lost" (Schmitt 1966: 532).

Philosophy in Safavid Persia

Jari Kaukua

Department of Social Sciences and Philosophy,
University of Jyväskylä/Academy of Finland,
Jyväskylä, Finland

Abstract

Often considered a high point of Iranian culture, the period of rule of the Ṣafavid dynasty (1499–1720) witnessed the flourishing of some of the most prominent postclassical Islamic philosophers, most notably Mīr Dāmād and Mullā Ṣadrā. But the wealth of philosophical activity in the period did not arise from nothing, nor did it end abruptly at the fall of the empire. Indeed, Ṣafavid philosophy is a natural outgrowth of the fourteenth- and fifteenth-century philosophical and theological debates, especially in Shīrāz, and most of the topics, questions, and solutions would continue to be debated down to the nineteenth-century Qājār era and ultimately to our own day.

The first Ṣafavid Shāh Ismā‘īl I conquered and united the politically splintered Persia of the post-Timurid era at the beginning of the sixteenth century. Following Ismā‘īl’s declaration in Tabrīz in the fall of 1501, a constitutive part of the new power’s cultural policy was its staunch Shī‘ism. The consolidation of this cause required considerable support from Shī‘ite scholars, many of whom were invited to move to Iran from the Shī‘ite stronghold in Jabal ‘Āmil in Lebanon. Their encounter with the endogenous Iranian tradition of learning gave rise to a sustained competition for the court’s favor – a situation which characterizes the activity of most philosophers of the era. In general, it seems that philosophically inclined scholars were relatively successful in their relations with the Ṣafavid court, for their philosophical activities were not merely tolerated but often encouraged by the rulers. The Ṣafavid era is indeed often conceived as a golden period of Iranian philosophy and Iranian culture at large. It witnessed the flourishing of thinkers who proved

formative for the subsequent development down to our day, including the most prominent examples of Mīr Dāmād (d. 1631/2) and Mullā Ṣadrā (d. 1635/6). Their work, like the results of the Ṣafavid religious policy, thus outlived the dynasty that was dethroned effectively in 1722 and nominally in 1760.

Heritage and Rupture with the Tradition

Ṣafavid philosophy did not arise from nothing. Iran, and Shīrāz in particular, was the site of vivid philosophical and theological discussion throughout the fifteenth century. This probably dates back to the activity of two famous theologians with strong philosophical inclinations, namely, ‘Aḍud al-Dīn al-Ījī (d. 1355) and his commentator al-Sayyid al-Sharīf al-Jurjānī (d. 1413/14). The latter’s role was especially formative for the thriving philosophical scene in Shīrāz, both of the primary actors of which, Jalāl al-Dīn al-Dawānī (d. 1502) and Ṣadr al-Dīn al-Dashtakī (d. 1497/8), were his second-generation students.

The philosophical scene in Shīrāz toward the end of the fifteenth century is dominated by al-Dawānī and al-Dashtakī, whose students would determine much of subsequent Iranian philosophy. Most important in this regard is al-Dashtakī’s son Ghiyāth al-Dīn al-Manṣūr (d. 1542), who rose to prominent positions under the Ṣafavid Shāhs and was even invited to supervise the rebuilding of the Marāgha observatory. Importantly, the senior Dashtakī founded a philosophical *madrasa* in Shīrāz in honor of his son, an important institution that Ismā‘īl I recognized by exempting it from taxation duties.

Dawānī and the senior Dashtakī are heirs to a tradition of Sunnī learning, which found its authority seriously compromised by the introduction of the new Shī‘ite scholars. But Ghiyāth al-Dīn represents a new generation, who tries to gain authoritative ground within the new creed, evitably with some success. Even after falling into disfavor as a result of a doctrinal conflict on the direction of prayer with the prominent jurist ‘Alī Karakī during the rule of Shāh

Tahmāsb I, he was allowed to continue teaching in his *madrasa*. Similar ambitions were entertained by Jalāl al-Dīn al-Astarābādī, a student of al-Dawānī, who rose to a prominent position, functioning as the chief of religious affairs (*ṣadr*) under the first two Shāhs. Other notable students of al-Dawānī and al-Dashtakī were Kamāl al-Dīn Mīr Ḥusayn Maybūdī (d. 1504), Shams al-Dīn al-Khafrī (d. 1535), and Najm al-Dīn Maḥmūd al-Nayrīzī (d. after 1536).

A notable feature of Shīrāzī philosophy, inherited from similar tendencies in earlier theologians, is its synthetic preoccupation with a wide array of intellectual traditions. No strict distinctions seem to have been perceived between philosophy (whether Avicennian or *ishrāqī*), theology, Sufism, and even the natural sciences. Another characteristic feature, again shared by the theologians of the earlier generation, is that the philosophers were mostly active as teachers and commentators. For instance, carrying on the debate between his father and al-Dawānī, the younger Dashtakī wrote four commentaries on his father's works, as well as a number of assessments on specific points of debate appended to the contestants' own commentaries, which in some cases make Ghiyāth al-Dīn's own works the fourth-generation commentaries.

The synthetic approach of the sixteenth-century thinkers is continued by Mīr Dāmād and Mullā Ṣadrā, but at the same time the seventeenth century witnesses a shift from commentary to the composition of original treatises and new philosophical *summae*. This approach becomes especially ambitious in Mullā Ṣadrā, whose *magnum opus*, the voluminous *al-Ḥikma al-muta'āliya fī al-asfār al-arba'a al-'aqlīya*, is an excellent example of it. It follows in outline the structure of the earlier theological *summae* but introduces material from a wider pool of knowledge, including not only theology and both Avicennian and *ishrāqī* philosophy but also the Sufi tradition, with special prominence given to Ibn 'Arabī and his followers. Another new feature in the philosophical literature of the period is the increasing use of Persian. While this was not unheard of (indeed, Avicenna had written a *summa* in Persian and

Suhrawardī produced a number of Persian treatises), writing in Arabic was still the norm, but subsequent authors would increasingly opt for Persian.

The bitter division between the old, philosophically inclined intellectuals and the new Shī'ite learned elite was relatively short-lived. In fact, one of the most prominent philosophers at the beginning of the second Ṣafavid century, Mīr Dāmād, was the grandson of 'Alī Karakī, the most authoritative of the Lebanese juristsprudents. This shows in the status of philosophy, for if the first two Shāhs had been relatively well disposed toward philosophy, this was definitely the case with 'Abbās I (1587–1629) during whose reign the new capital Isfahan became the center of philosophical life in Iran. The second half of 'Abbās' reign marks the point of entry of the so-called school of Isfahan, with Mīr Dāmād at its spearhead, the most important representatives of which served in positions at least as close to the court as those of the previous generation. Thus, although opposition to philosophy from some juristsprudents continued and although tides seem to have varied in this regard (Mullā Ṣadrā's self-imposed exile to the tiny village of Kahak, allegedly due to intrigues in the scholarly circles of Isfahan, being a case in point), in light of the de facto power of some of the main philosophical figures, overarching statements about the philosophers' aversion to politics seem unfounded. This was still the case during the time of Mullā Ṣadrā's student Muḥsin Fayḍ Kāshānī (d. 1680), who was a major juristsprudent and intimate to Shāh 'Abbās II.

In fact, it is a genuinely new feature of the Ṣafavid era that so many of the philosophers made their profession as religious officials. That philosophy is a pastime passion is not new in the Islamic context; the philosophers had always had to make their living by means of other fields of science, and with the exception of late and post-Ṣafavid Iran, the teaching institutions in the Islamicate world have traditionally not included philosophy as an independent discipline in their curriculum. But where earlier generations of philosophers were usually active as professionals in

the rational sciences, the Şafavid philosophers seem to have adopted a somewhat denigrating attitude to such mundane professions. Characteristic is Mullā Şadrā's critical remark in a review of Avicenna's attempted solution to an eschatological problem: had the great philosopher spent less time and effort on medicine and invested more in philosophy and religious striving, he would have met with greater success in tackling the problem. As a result of this bias, the renaissance of philosophy during the Şafavid era seems not to have been accompanied by the kind of flourishing of the other rational sciences that was characteristic of the classical period of Islamic philosophy. The religious credentials of the major Şafavid philosophers must also have been pivotal to their general veneration as men of wisdom.

A sociologically interesting feature of the period is also the emergence of dynasties of learned men, not unlike the parallel dynasties of jurists, some of which intersect with those of philosophers. The Dashtakīs seem to have established a pattern followed by both Mīr Dāmād and Mullā Şadrā, who had influential sons-in-law that carried on their work and produced philosophically active offspring in turn.

Innovative and Original Aspects

One of the most celebrated Şafavid contributions to philosophy is Mīr Dāmād's attempt at the solution of the Avicennian problem of how God is related to His creation. In particular, how can an absolutely unchanging and atemporal entity give rise to something that is in time and in constant flux? Mīr Dāmād's solution is based on a meticulous analysis of different senses of coming to be (*ḥudūth*) and different kinds of atemporality, depending on whether we consider the atemporal in its atemporality or in its relation to time. This analysis gives rise to the celebrated notion of "perpetual coming to be" (*ḥudūth dahrī*).

A debate characteristic of seventeenth-century Şafavid philosophy hinged on the question of which of the two key notions of Avicenna's metaphysics, existence and essence, is metaphysically

foundational. Mīr Dāmād is famous for having represented the allegedly Suhrawardian idea (known as *aşāla al-māhīya*) according to which essences constitute the basis of reality, whereas existence can be explained as a feature derivative of the thinking mind. For the posterior Iranian philosophical tradition, however, it would be Mullā Şadrā's diametrically opposed view that existence is foundational (*aşāla al-wujūd*), essences being explicable as features introduced by the intellect.

Closely related to the foundational status of existence is Şadrā's concept of substantial motion (*ḥaraka jawharīya*). This is a radical departure from Avicennian Peripateticism, which had specifically denied motion in the category of substance, claiming that this would make it impossible to attribute any kind of stable and knowable identity to beings; were it not for substantial forms, everything would be in flux and nothing could be known. Fully aware of this argument, Şadrā substantiates his theory with a new idea of identity. Curiously resembling contemporary four-dimensionalist theories of identity, Şadrā seems to suggest that absolute identity conditions can only be known from God's atemporal perspective, whereas all being and knowledge in time are subject to constant flux and development.

Finally, Mullā Şadrā also subscribed to the theory of cognitive identity or unity, that is, the view that in any act of cognition, the act itself should be conceived as an identity in being of its subject and object. Put another way, subject and object are only analytically distinguishable, not really distinct constituents, of the act of cognition. Although this idea is not entirely new (in fact, it can be traced back to Aristotle's description of sense perception and intellection in his *De Anima*), it does mark a significant departure from the Avicennian mainstream in the philosophical psychology of Şadrā's time.

Impact and Legacy

Although the generation of Mīr Dāmād and Mullā Şadrā can be said to represent the high point of

Şafavid philosophy, philosophical activity by no means came to a close after the first half of the seventeenth century. The most important students and commentators of Mīr Dāmād were Sayyid Aḥmad ‘Alawī ‘Āmilī (d. between 1644 and 1650) and Mullā Shamsā Gīlānī. Mullā Şadrā also had a number of influential students, including his sons-in-law ‘Abd al-Razzāq Lāhījī (d. 1661/2) and Muḥsin Fayḍ Kāshānī (d. 1680), Muḥammad ibn ‘Alī Riḍā Aghājānī (the author of a massive commentary on Mīr Dāmād’s *al-Qabasāt*, of whom little else is known), and Shaykh Ḥusayn Tunikābunī (d. 1690 or 1694).

Another important teacher was Mīr Abū al-Qāsim Astarābādī Findiriskī, whose students include Ḥusayn Khwānsārī (d. 1686/7), Muḥammad Bāqir Sabzawārī, and Rajab ‘Alī Tabrīzī (d. 1669/70). Of particular importance for subsequent generations of philosophers was Tabrīzī who, emphasizing a strict distinction between the existence of the Creator and that of creation and denying the doctrine of substantial motion, would provide a critical alternative to Mullā Şadrā down to the Qājār era. He had many students, the most important of whom was the notable philosopher, theologian, and jurisprudent Qāḍī Sa‘īd Qummī (d. 1691/2). Qummī, however, was also a second-generation student of Şadrā’s through Kāshānī and Lāhījī, and it is to the latter’s doctrine that he seems to have been inclined in his own writings.

An interesting feature of post-Şadrian Şafavid philosophy is a decisive turn to a combination of mysticism and philosophy (*‘irfān*), coupled with the opening of several Sufi centers, and a strongly traditionalist (*akhbārī*) take in jurisprudence. This shift culminated especially in Kāshānī but also in a more moderate form in Lāhījī, which received the blessing of the Shāhs Şafī (r. 1629–1642) and ‘Abbās II (1642–1666), and made philosophers once again close to the court. This would not remain the case, however, for hard-line rationalist (*uṣūlī*) jurists would gain the upper hand in the late seventeenth and early eighteenth century, which resulted in a drastic decline in the veneration, indeed legitimacy, of philosophical pursuits. Thus, for example, Qummī would be imprisoned for a time during the reign of Shāh Suleymān

(1666–1694). Philosophy became a largely questionable activity and certainly ceased to be part of the mainstream of the Shī‘ite scholars. It is due to the renaissance of Mullā Şadrā’s philosophy in the nineteenth and twentieth centuries that philosophy is featured in the curriculum of the Shī‘ite seminaries in Iran.

Such difficulties notwithstanding, philosophical activity continued uninterrupted until the end of the Şafavid era and beyond, but research on this late period is hardly in its infancy. A characteristic feature seems to have been the gradual increase in importance of Mullā Şadrā’s philosophy at the cost of the Avicennian and the *ishrāqī* alternatives. Notable thinkers of the later Şafavid period include Mullā Ḥasan Lunbānī (d. 1682/3); Mīrzā Muḥammad Şādiq Ardistānī (d. 1721/2); his student Mīrzā Muḥammad Taqī Almāzī who seems to have been the first to teach Şadrā’s philosophy in the context of the Shī‘ite seminary, ‘Ināya Allāh Gīlānī, an Avicennian; and Mīr Sayyid Ḥasan Ṭāliqānī. Their activity was crucial for the second blooming of philosophy during the Qājār period.

Physiognomy in Renaissance Science

Manuela Bragagnolo

Max Planck Institute for European Legal History,
Frankfurt am Main, Germany

Abstract

Rooted in the mutual correspondence between body and soul and based on a codified system of signs on the face and body, physiognomy aimed to judge character and nature from the visual analysis of physical appearance. As a law, rule (*nómos*) of nature (*physis*), it reached its greatest importance during the Renaissance, when, as never before, people pursued Socrate's idea of a window opening onto the heart, making visible invisible inner moral inclinations.

Physiognomy had both divinatory and medical origins. It spread to the West in the twelfth century, when ancient texts from Greek and Arabic traditions became available to the Latin reader. Primarily used by princes, it was recognized as a science by medieval academics who provided it with a causal explanation by recurring to the medical theory of humors and astrology, and then included it in the university curriculum. Thanks to the Latin translation of *Physiognomonics*, which was attributed to Aristotle at the time, physiognomy became part of natural philosophy.

The connection between physiognomy and the medical theory of humors consolidated during the Renaissance, when curiosity in

decoding the secrets of nature placed physiognomic investigation in the framework of a new attention to signatures and sympathies, thus renewing an interest in physiognomic syllogism and the analogy between animals and men. The special attention art theorists paid to physiognomy intertwined with new analytical and rhetorical instruments at the physiognomist's disposal, thus contributing to improving the theoretical framework of physiognomic judgment, which strengthened its fundamental role not only in politics but also in judicial courts. The condemnation of the divinatory dimension of physiognomy by the Roman Church favored the spread of books on natural physiognomy, pushing authors to rethink and redefine the aims and limits of their art.

Heritage and Rupture with the Tradition

Physiognomy (from the Greek *physis*, “nature” and *gnomon*, “interpreter” or *gnome* “indicator”) had both divinatory and medical origins. It started as a circumstantial practice based on careful, direct observation and interpretation of bodily signs. Like divination and medical semiotics, it was originally orientated to the analysis of concrete cases, to be solved only on the basis of clues, traces, and symptoms (Ginzburg 1986; Magli 1995, 25–50).

It spread to the West in the twelfth century, when ancient texts from Greek and Arabic traditions became available to the Latin reader. Philosophers and academics started to discuss its epistemological status, object, methods, and aims, thus neutralizing its divinatory and circumstantial nature and normalizing it as a moral and natural science (Agrimi 2002, 13). Late medieval and then Renaissance physiognomists referred to physiognomy as *nomos*, a “rule” of nature.

Due to its political importance as a major art of government – it was seen as enabling a prince to recognize men's virtues and vices and therefore help him in choosing his advisers – it was at the

court of Emperor Frederick II, and then of his son Manfred, king of Sicily, that some of those texts, which later became the starting point for the scholastic debates on physiognomy, circulated for the first time (Ziegler 2005): the Latin translation by Filippo da Tripoli of *Secretum Secretorum* (which was thought to have been written by Aristotle for his student, Alexander the Great), *Liber Physonomiae* by Michele Scoto (1230 ca.), and, later, the Latin translation by Bartolomeo da Messina of *Physiognomonics* (1260), which was also attributed to Aristotle at the time. The first and the last text, together with *De Physiognomia Liber*, an anonymous Latin treatise based on the classics of Greek physiognomy: Aristotle, Loxus, and Polemon, and *Ad Almansorem* by the Arabic physician Rhasis, constituted the canon by which physiognomy evolved into a scholastic science in the twelfth and thirteenth centuries (Agrimi 2002, 103).

The pseudo-Aristotle treatise was quickly adopted as the main scholastic reference tool: thanks to it, physiognomy became part of natural philosophy as the “*scientia de libro physionomiae*” (Agrimi 2002, 13). *Physiognomonics* elaborated the fundamental principle of physiognomic knowledge, the mutual influence between body and soul, and then defined which kind of signs should be taken into account in making a physiognomic judgment, for example, the quantity, type and color of hair, the sort of skin, the way of moving, the quality of voice, the shape and dimension of individual parts of the body, and the general physical appearance. Moreover, it provided a physiognomic description of 22 typologies of character – from the brave man to the one who had a good memory – and offered a systematic catalogue of bodily signs and their moral and intellectual meaning. Therefore, and most importantly, it systematically developed the analogy between men and animals linked to the physiognomic syllogism already described in Aristotle's *Prior Analytics* (II, 27). Due to their simpler form, animals were considered a necessary mediation to understand men's moral inclinations from their physical appearance. Referring

to an animal, the classic example being a lion, the physiognomic syllogism logically fixed the connection between a specific sign (e.g. having large extremities), and a particular character (in this case bravery) (Magli 1995, 118–127).

Following Scotto and his medical reading of physiognomy, medieval academics such as Pietro d'Abano (*Liber compilationis physionomiae*, 1295) and, later, Michele Savonarola (*Speculum Physionomiae*, 1455 ca.) recognized the scientific status of physiognomy, recurring to medical and astrological frameworks and therefore advancing beyond the simple repetition of consolidated lists of signs and their meaning, which characterized the classical tradition. By giving causal explanations, they tried to provide the discipline with solid theoretical bases, which they found in the Hippocratic-Galenic doctrine of humors (blood, phlegm, yellow bile, black bile) and temperaments (the permanent psychical dispositions, which were directly related to and caused by the compound of the four humors: complexion). Both philosophers and academic physicians recognized the scientific validity of physiognomy. While medicalization and causal explanation were the two main contributions of medieval physiognomy to the ancient one (Agrimi 2002, 56; Ziegler 2004), philosophic reasoning contributed to defining its limits. Philosophers felt the need to label it as a posteriori science, which could provide its practitioner with probable and conjectural knowledge: it only allowed the detection of moral inclinations rooted in the radical complexion, but could not predict actual behavior (Ziegler 2007).

This learned academic tradition strengthened Renaissance thinking, and the link between physiognomy, medicine, and natural philosophy became a recurring element in many publications of the time, starting with *Quaestio de subjecto physionomiae et chiromantiae* by Alessandro Achillini (1503) (Ziegler 2004).

The medical theory of humors became a fundamental component in Renaissance commentaries on Pseudo-Aristotle's *Physiognomonics*, which kept being commented on, printed, and taught at universities in the framework of

Aristotle's *Parva Naturalia* (Grendler 2002, 270). From Agostino Nifo (1523) to Camillo Baldi (1621), Renaissance academic commentaries on pseudo-Aristotle's text constantly referred to Galen within the framework of a renewed interest in the scholarly study of the soul through medicine and anatomy.

Renaissance physicians, such as the reformed Guglielmo Grataroli (*De praedictione morum naturarumque hominum*, 1553) and Girolamo Cardano (*Metoposcopia*, 1658 and *De utilitate*, 1561), manifested a particular interest in physiognomy. The idea that morality was connected to the balance of humors consequently created the idea that it was possible to modify men's moral inclinations by reason or education. A classic example of this, widespread in Renaissance physiognomic literature, was the physiognomic judgment of Socrates made by Zopyrus the physiognomer, who found signs of vicious inclinations on his face and body which the philosopher had been able to correct through his reason. In some instances, therefore, it was seen as possible to cure bad moral inclinations just like curing an illness. Intellectual inclinations were also linked to the balance of humors. For this reason, physiognomy played a significant role in the Renaissance debate on wits (Getrevi 1991, 53–72), which – starting with *Examen de los ingenios para las ciencias* (1575) by the Spanish physician Juan Huarte de San Juan, which was aimed at identifying young people's intellectual inclination in order to serve the Spanish Monarchy better – spread widely in Europe.

Grounding physiognomy on humoral medicine and anatomy was also a way to strengthen its epistemological status. In his *Fisionomia Naturale* (1606), printed posthumously by his nephew Angelo, the jurist and bishop Giovanni Ingegneri tried to demonstrate the conclusions reached by Aristotle and other ancient physiognomists with arguments taken from natural philosophy, medicine, and anatomy. By referring to complexion or to the combination of the natural elements, he was using methods, which belonged to a higher science than that of the

physiognomist (Ingegneri 1606, 8; Bragagnolo 2016a, b).

Physiognomy and the Counter-Reformation Church

The great development in the second half of the sixteenth century of “natural physiognomies,” linked to the medical tradition, was that related to the battle fought by the Roman Church against divinatory arts, *in primis* judicial astrology, which culminated in Sixtus V’s Bull *Coeli et terrae* (1586). This battle also involved those branches of physiognomy, which were traditionally linked to divination, such as metoposcopy or palmistry. These disciplines, widespread in the sixteenth century, looked at the bodily signs which were thought to be directly impressed by the stars on the body, particularly on the hands and foreheads, to foresee a man’s destiny, thus leaving dangerously little place for human free will. It was mainly due to the link with those arts for predicting the future that physiognomy swang between a licit and illicit discipline in the Roman Indexes as well as in discussions within the Roman Congregations, which distinguished between natural and divinatory arts, admitting the former and condemning the latter (Bragagnolo 2016b). Although the Church finally condemned divinatory physiognomy, it allowed the natural one, which was connected to the analysis of human complexion. But the potential danger of physiognomy to the principles of Christian ethics pushed authors to rethink and redefine it, as is seen in long prefaces discussing the aims and limits of their art. In this way, they tried to overcome the suspicions of the Church towards the deterministic implications of physiognomy on human actions, related to both the influx of stars and the dependence on bodily structures. Late sixteenth-century physiognomists stressed the distinction between physiognomy and divination, namely judicial astrology, by insisting on the conjectural nature of their art, which could not predict men’s behavior but only understand men’s inclinations to particular virtues or vices. They claimed the moral value of physiognomy as

working as a mirror in which men could see their bad moral inclinations (thus becoming physiognomists of themselves) and then correct them. Explaining the mutual interdependence between body and soul, which opened pseudo-Aristotle’s *Physiognomonics*, physiognomists affirmed the primacy of the latter over the former. That was also the case in the most complex and fascinating treatise of physiognomy printed in the Renaissance, *Humana physiognomonica* (1586) by Giovan Battista Della Porta (Bragagnolo 2016b).

Innovative and Original Aspects

As never before, people in the sixteenth century pursued Socrate’s idea of the “window opening onto the heart,” thus making visible invisible inner moral inclinations (Bolzoni 2001, 151–173). Renaissance texts intertwined physiognomic medical traditions with a renewed philological interest in a broader range of ancient texts. While systematizing the consolidated catalogues of physiognomic signs, physiognomists provided an extensive methodological reflexion on how to read bodily physiognomic signs. Moreover, general curiosity in decoding the secrets of nature placed physiognomic investigation in the framework of a new attention to signatures and sympathies, thus reviving interest in physiognomic syllogism and analogy between animals and men.

Giovan Battista Della Porta’s *Humana Physiognomonica* (1586) systematically gathered and developed ancient and medieval physiognomic traditions, adding his direct physiognomic observations to academic knowledge. It placed physiognomy in the framework of a magic vision of the world, applying the law of signatures to the human realm. Making the analogy between men and animals the core of his book – and the main topic of the gallery of its beautiful illustrations – Della Porta used physiognomic syllogism to position Renaissance physiognomy as a science. He employed the result of Aristotle’s physiognomic syllogism as a premise for a second one (if all lions are strong and some men resemble lions, the consequence is that those men are strong too) and then applied it to a wider spectrum of cases (Magli

1995, 168–181), which he had mainly used in his theatrical works (Bolzoni 2001, 163). At the same time, he maintained the causal explanation relating to the theory of humors, dedicating the sixth book of his treatise to how it was possible to cure bad moral inclinations.

Della Porta went into great detail when analyzing the signs to be considered for a physiognomic judgment and stressed the importance of distinguishing between permanent and temporary signs. While the first ones were born and died with men, and so were the proper object of physiognomic judgment, the second ones were accidents, able to reveal temporary states of the soul, like passions. If not correctly recognized, temporary signs could alter the physiognomic judgment. Della Porta also defined a hierarchy of signs, considering the face, particularly the eyes, the most important one.

In Della Porta's book, as in many other Renaissance physiognomic treatises, the Aristotelian idea of "mean," a middle state between two vicious extremes in physical shapes, which related to ethical *mesotes*, was the main reference for the interpretation of the signs (Vigh 2016). This principle interacted with the renewed attention paid to proportions by sixteenth-century art theorists and painters, who associated vices with mathematically deformed physiognomies (Magli 1995, 198–214). But it was not a one-way process, just as art theory had an impact on physiognomic writings, physiognomy was also extensively used by artists to depict the morality of the portrayed persons as well as to "visualize great men of the past" (Bolzoni 2001, 172; Casini 2000). Moreover, as physiognomy was a place where "several disciplines met," it became a "privileged site of conceptual change in late Renaissance" (Maclean 2011, 295; 2006).

With law and the theory of proofs, rooted in Aristotle's rhetoric and filtered through Cicero and Quintilian, Renaissance physiognomy shared a logic which stood behind the physiognomic judgment. Following pseudo-Aristotle, physiognomists could not base their judgment on the interpretation of a single sign, but they should collect several signs together and judge on the basis of various concordant witnesses (Della

Porta 1586, 86–87). Likewise, for condemning the defendant, the system of legal proofs, which characterized the Roman-canon Inquisitorial procedure, required a full proof which could be reached with at least two concordant witnesses: *Unus testis, nullus testis* ("One witness is no witness"). Evidence relied on a rigid hierarchy of proofs. Accumulating concordant half-proofs (conjectures, presumptions), or legal clues (*signa, indicia*), was a way to produce a higher-level proof. Generally speaking, several concordant physiognomic signs could generate what jurists called a (simple) presumption concerning moral inclinations: a probable knowledge derived inductively from something known, which could be invalidated by proving the contrary.

But it was not merely a question of methodological similarity. In the system of legal proofs, physiognomy had a specific legal relevance. Physiognomy in particular was taken into account among those clues which could lead to the defendant's torture, because a bad physiognomy presumed him to be inclined to crime. Technically speaking it generated a presumption about the defendant's nature.

Law and Physiognomy

Following Baldus' (†1400) commentary to Justinian's Code (C.7.65.2), medieval and early modern jurists agreed in saying that while a good physiognomy ("bona physionomia") favored the defendant, a bad physiognomy ("mala physionomia") harmed him because it presumed him to be inclined to crime. A bad physiognomy did not make a presumption of committing a specific crime but a general presumption of a bad and faulty nature. For jurists, who referred explicitly to pseudo-Aristotelian *Physiognomonics*, it was possible to deduce arguments from the contemplation of nature, which could be used in a trial.

Medieval and Early Modern *Practicae criminales*, and then sixteenth-century treatises on clues, further developed the interaction between law and physiognomy, better defining its use as a legal clue. They stressed that if many

persons were to be tortured, they should start with the one who had the worst physiognomy. However, a bad physiognomy was not sufficient reason to request the defendant's torture because that needed to be confirmed by other concordant evidence at his charge (Bragagnolo 2018).

It was possibly because of this legal thinking on and use of physiognomy in trials that the authors of two well-known treatises on physiognomy – Giovanni Ingegneri (*Fisionomia Naturale*, 1606) and, some decades later, moving from physiognomy to gestures, Giovanni Bonifacio (*Arte de' cenni*, 1616) – were jurists and judges.

Impact and Legacy

Renaissance physiognomy and its aim of detecting human personality via a codified system of fixed bodily signs maintained a concept about the link between body and soul in the following centuries. The well-known eighteenth-century book on physiognomy, Lavater's *Physiognomische Fragmente* (1775–1778), can be seen as the high point of this long tradition. But the idea of a direct connection between the bodily structures and moral inclinations, founding its new bases in anatomy, physiology and neurology, developed in nineteenth-century phrenology, thus having an impact on Cesare Lombroso's criminal anthropology some decades later (1991; Magli 1995; Rodler 2009, 13–49).

At the same time however, from the seventeenth-century onwards, the attention of several physicians, painters, and naturalists – from Marin Cureau de la Chambre (*L'art de connaître les hommes*, 1659), to Charles le Brun (*Conférence sur l'expression*, 1668) and Charles Darwin (*Expression of the Emotions in Man and Animals*, 1872) – moved away from understanding men's characters to detecting the expression of emotions and feelings on face. Making correlations between the contraction of facial muscles and emotional feelings, they developed a path, which helped lead to contemporary neuroscience (Freedberg 2014).

University Higher School of Economics,
Moscow, Russian Federation

Abstract

Michael Piccart (1574–1620), a student of Philipp Scherb and Nicolaus Taurellus, taught logic, metaphysics, and poetics at the University of Altdorf since 1599. In logic and

metaphysics, he was mainly a follower of his teacher Scherb while preparing the ground for hermeneutic as a part of logic and introducing political philosophy as an independent sub-discipline into the philosophical curriculum. His influence on the later evolution of philosophical eclecticism is disputed. Kant was apparently aware of his work.

Alternate Names

Pickart, Michael; Pickhard, Michael; Picardus, Michael; Piccardus, Michael

Biography

Son of the pastor and rector of Altdorf University Johann Piccart and his wife Anna, née Kirchberger. Piccart studied at Altdorf University between 1586 and 1592. Doubts about his Lutheran orthodoxy stood in the way of a career as pastor or theologian. Suspicions of Socinianism could not be proven. In 1599, he succeeded his teacher Philipp Scherb (approx. 1555–1605) as professor of logic at Altdorf University. In 1604, Piccart became professor of poetry, in 1613 of metaphysics (Vollhardt 2016 with a complete bibliography of Piccart's writings). He probably taught history as well as politics in private lectures (Mährle 2000, 314).

Heritage and Rupture with the Tradition

Piccart worked in a period in which Lutheran school philosophy in Germany began to establish itself as an independent philosophical paradigm (Spam 2001, 475). He stands in the tradition of his teachers Philipp Scherb and Nicolaus Taurellus. His *Isagoge in lectionem Aristotelis* (Piccart 1605) is regarded by some as the most comprehensive summary of the philosophical tenets of Altdorf Aristotelianism that is characterized by logical instrumentalism (Mährle 2000, 219) and an understanding of metaphysics as a discipline based on wisdom and aiming for natural

knowledge of God (Spam 2001, 568–569). Besides metaphysics, Piccart made significant contributions to political philosophy, philosophical methodology, and logic.

Innovative and Original Aspects

In logic, Piccart was among the first to distinguish ancient and modern ways of disputing through questions (Felipe 2010, 35). In metaphysics he further developed the notion of metaphysics as natural theology, not a general science of being (Spam 2001, 568–570) and defended an “ontotheological” conception of the discipline (Leinsle 1985, 295). His work on Aristotle's *Politics* is regarded as one of the major contributions in the seventeenth century, on the same level of sophistication as Heinsius and Conring (Dreitzel 1970, 137). In 1607, he presided over the first German dissertation dedicated to Lipsius's political theory (Oestreich 1969, 130). He directed several dissertations in this area, at least in part on request of his students who often appear as both author and respondent (Philipp 2014, 214, 257). These texts discuss not only Lipsius, but other contemporary thinkers like Macchiavelli and Bodin (Philipp 2014, 257–258).

Impact and Legacy

Piccart's role in the prehistory of the seventeenth and eighteenth century German eclecticism is disputed (see Marti 2014, 183, for an optimistic assessment; Albrecht 1994, 149f, for a more skeptical evaluation). His comments on hermeneutic method had a significant impact on Dannhauer's hermeneutic (Sdzuj 2011, 595; Mährle 2000, 225–226, who claims that Piccart's understanding of interpretation was rooted in the didactic methods of his teacher Scherb). Immanuel Kant quotes the title of Piccart's *Isagoge* (1605) in a handwritten note (Kant 1966, R 4160, 439). This may suggest that he used Piccart as an inspiration for the distinction of analytic and dialectic (Pozzo 1989, 23).

Abstract

The Sienese Alessandro Piccolomini (1508–1579) was involved in various academies and was active in such diverse fields as playwriting, logic, mathematics, natural philosophy, moral philosophy, rhetoric, and poetics. He promoted a cultural program, which

aimed among other things to make philosophy accessible to women. Among his copious writings are the *Institutione*, one of the most influential Renaissance adaptations of Aristotle's *Ethics* (1542; a revised edition appeared in 1560); a vernacular treatise on logic (*L'istrumento de la filosofia*, 1551); and a commentary on the *Poetics* of Aristotle, preceded by a translation of this work (1572, 1575).

paulo quidem plenior and *Commentarium de certitudine mathematicarum disciplinarum*, both printed in 1547; the manuscript with the *Annotationes in Horatium* (Refini 2009, 2013), under the influence of Varchi and Speroni, he developed a comprehensive program of vernacularization of knowledge, which aimed among other things to make philosophy accessible to women (Panizza 2016). He then dedicated almost the rest of his life to the development of this program.

Biography

At the age of nine, Alessandro Piccolomini had already received several church benefices which were conferred on him by his uncle, Cardinal Giovanni Piccolomini in Siena. Alessandro studied at the university at Siena and Padua (1538–1542). He then moved to Bologna, where he studied for a short period at the local university until the summer of 1543, when he moved back to his native Siena, which he left again in 1546 and 1550, when he relocated to Rome. In 1555, he was ordained priest, and then, he was appointed coadjutor of the archbishop of Siena, Francesco Bandini Piccolomini, with the honorific title of Archbishop of Patrae in 1574 (Tomasi 2015). Piccolomini was closely involved in the *Accademia degli Intronati* (Academy of the Bewildered) in Siena, of which he later became the key figure (Baldi 2001; Cerreta 1960). Along with Sperone Speroni and Benedetto Varchi, he was a leading personality in the *Accademia degli Infiammati* (Academy of the Burning Ones) in Padua (Mikkeli 1999). Probably as a result of his stay in Padua, he moved away from his initial interests in theatre (see the comedy *L'Amor Costante*, 1536, and the comic dialogue *La Raffaella*, 1538) and classical literature (see his translations from Virgil, 1536; Xenophon, 1538; and Ovid, 1539) – though he never abandoned them completely – toward philosophy and science. Apart from a few works in Latin (among which are the translation of Alexander of Aphrodisias' commentary on Aristotle's *Libri metereologicorum* and the treatise *De iride*, published in 1540; *In mechanicas quæstiones Aristotelis paraphrasis*

Innovative and Original Aspects

The most strikingly original and innovative aspect of Piccolomini's works does not consist of a specific philosophical or exegetical approach, nor is it expressed in one single writing. Rather, it was his systematic pursuit of a program of vulgarization of philosophical and scientific knowledge. If we exclude his most strictly scientific treatises (such as the astronomical works *De la sfera del mondo* and *De le stelle fisse*, 1540 – the first one was very successful and was reissued in 1566; *Della grandezza della terra et dell'acqua*, 1558; *La prima parte delle Theoriche*, 1568), Piccolomini devoted himself mostly to Aristotelianism. Following on from the program sketched already in an early letter written to Pietro Aretino (20 March 1541), Piccolomini approaches the Aristotelian corpus by using broad-range exegetical tools such as treatises, compendia, paraphrases, translation, and glossing, encompassing ethics, logic, natural philosophy, rhetoric, and poetics.

The *Institutione*, with its two very different versions (1542 and 1560), established its author as an outstanding authority in the field of ethics (Poppi 1997; Quondam 2010; Schmitt 1979): the second one, in particular, became a standard book of religious formation, reprinted eight times before the end of the sixteenth century and soon translated into Spanish (by Juan de Barzona y de Padilla, 1577) and French (by Pierre de Larivey, 1581). Although the *Institutione morale* was more successful than the *Institutione de l'homo nato nobile*, the first *Institutione* is crucial in many respects: first, because it marks a clear break from Piccolomini's youthful

experience as a member of the Accademia degli Intronati and in particular from his comic dialogue *Raffaella* (1539), of which the *Institutione* offers a kind of palinode, turning Piccolomini into a professional philosopher, and, second, because through a close rewriting – without acknowledgment – of Speroni's dialogues on love and on the household management (→Speroni, Sperone) Piccolomini develops a personal style for his philosophical discourse, corresponding to a more general pattern in contemporary philosophical prose summed up in Virginia Cox's formula "from the open dialogue to the closed book" (Cox 1992; Cotugno 2020).

Piccolomini's trajectory as a philosopher comes to a high point with the *Instrumento de la filosofia* (Cotugno 2014; Sgarbi 2014), an ambitious compendium of Aristotelian logic, to which he then adds a part on natural philosophy (1551, 1554). In later years, Piccolomini came to favor a more direct engagement with Aristotle's thought and even with his own words. This is the background for his vulgarizations of the *Rhetoric* (1565, 1569, 1571, 1572) and especially of the *Poetics* (1572, 1575). The latter is characterized by accurate exegesis of the most controversial passages of Aristotle's short treatises: comments via glossing ("per via d'annotationi"). This allows him to take into account, and often to criticize polemically, the Latin and vernacular exegetical traditions (see especially the case of Lodovico Castelvetro, who is mentioned by name; Cotugno 2006, 2015). At the same time, Piccolomini insists on a faithful presentation of Aristotle's own words: he includes important considerations on translation in the *Epistola ai lettori del modo di tradurre*, which accompanied both the vulgarization and the commentary on the *Poetics*. This text is one of the most important documents on translation, especially philosophical translation, of the fifteenth century (Lines and Puliafito 2019).

Piccolomini, Francesco

Born: 25 January 1523, Siena

Died: 22 April 1607, Siena

David A. Lines

Italian Studies, School of Modern Languages and Cultures, University of Warwick, Coventry, UK

Abstract

A professor of philosophy who spent most of his career at the University of Padua, Francesco Piccolomini was one of the most important and influential Italian interpreters of Aristotle in the second half of the sixteenth century. He was involved in a number of controversies, concerning the soul with Federico Pendasio and concerning the proper order of philosophical education with Jacopo Zabarella. His work on moral philosophy is possibly the most significant Italian treatment of that area of philosophy for the Renaissance period. Piccolomini is also important methodologically for his attempt to marry Aristotelianism and Platonism.

Alternate Names

Piccolomineus, Franciscus Carolus

Biography

Of a noble Siennese family, Piccolomini (biography in Baldini 1980b) studied and graduated in *artibus et medicina* at the local university (1546), where he probably studied under his distant relative Alessandro Piccolomini. He then taught philosophy at the University of Siena (1546–1549) and joined the Siennese Accademia degli Intronati (as “Il malinconico”) around 1549. He subsequently taught philosophy in Macerata (1549–1550) and Perugia (probably 1550–1560) before receiving an appointment at the University of Padua, where he taught for most of his career (1560–1598). Already in 1565, he was given the first chair of natural philosophy, initially in concurrence with Federico Pendasio. His differences with Pendasio eventually led the latter to seek employment elsewhere (he moved to Bologna in 1571); Piccolomini became the main teacher of philosophy in Padua, attaining an unprecedented salary for his subject (1,000 gold *scudi* in 1589). He was enormously influential on both Italian and foreign students, who included personalities such as Torquato Tasso (on whom see Kraye 2002, pp 79–80). Although he continued to be listed on Padua’s teaching rolls until 1600, in 1598 he retired to Siena, where he continued to be active in the production of philosophical works up to his death.

Of fairly elevated lineage himself and of a highly cultured family (his father was doctor *in utroque iure* and held important political offices), throughout his lifetime Piccolomini cultivated close contacts with those in power. He dedicated several of his works to the Venetian Senate (Jardine 1997) and, both before and after his retirement, to the Medici. He also maintained strong connections to his hometown, where he usually spent the summer holidays. In 1572 Piccolomini married a Siennese noblewoman, Fulvia Placidi, with whom he had two sons and two daughters. In September–October 1579 he held the office of prior in the *terzo* of S. Martino. After his retirement from teaching, in September–October 1599, he served as *capitano del popolo* for the *terzo* of Camollia. He joined and was active in the Siennese academy of the Filomati

(taking the name “Unico”). He was buried in the church of S. Francesco.

Heritage and Rupture with the Tradition

Despite portrayals (particularly in the older literature) of Piccolomini as fundamentally a Platonist (as in Garin 2008) or even a Scotist (Lewis 1978, 1980), recent literature has stressed his Aristotelian orientation, also as a university professor of philosophy (Kessler 1987, 1988; Poppi 1976). Piccolomini must be seen within the context of the sixteenth-century attempts to reconcile various philosophical schools, and several times he emphasizes the importance of taking into account both Aristotle and Plato in one’s views (Saitta 1961, pp 427–29; Plastina 2002) against the practices of some who declared allegiance to only one of the two. Toward Stoicism he held a highly ambivalent attitude, disagreeing with it on various points, but at the same time using it to support his philosophical framework (Kraye 2002). Although he is sometimes referred to as an Averroist (Nardi 1958; Saitta 1961), the label needs to be used with great caution.

Innovative and Original Aspects

Among the most notorious episodes of Piccolomini’s career was his long-standing dispute with Jacopo Zabarella, his colleague in Padua, on the proper order of knowledge and education (Ragnisco 1885–1886; Scattola 2002, pp 278–84; Lines 2002a, pp 256–63, 2002b, pp 311–21 for more recent bibliography). The exchanges between the two men were not the most temperate, and modern scholarship has tended on the whole to favor Zabarella’s position (well described in Poppi 2004). Piccolomini’s reputation has not been enhanced by his insistence on having the last word, after his adversary’s death. Nonetheless, Piccolomini’s position is one of great interest; responding to Zabarella’s *Opera logica* (and especially the *De natura logicae* and *De methodis*) of 1578 through his *Universa philosophia de moribus* (1583) and again to

Zabarella's *De doctrinae ordine apologia* (1584) through his *Comes politicus* (1594), Piccolomini promoted a view of teaching that, in certain cases, should feel free to adopt either the *ordo compositivus* or the *ordo resolutivus* depending on a teacher's preference. Zabarella instead thought that teaching depends on our order of apprehension and that those disciplines (including moral philosophy) that have action as their object should be taught according to the *ordo resolutivus* (starting, i.e., from a notion of the particular subject's end, as Aristotle does in the first paragraph of his *Nicomachean Ethics*). It should be emphasized that the discussion about the order of teaching was not original with Zabarella and Piccolomini (for pointers and bibliography on German antecedents, Scattola 2002, pp 284–287; Lines 2002a, p 258 n. 68), but their controversy certainly accelerated a debate that continued into the early seventeenth century and which echoed many of their concerns while also drawing on their approaches and solutions. From Piccolomini, for instance, German interpreters drew their idea that politics can be properly studied and taught only if one has determined the subject's *subiectum* and *ordo* (Scattola 2002, p 288); his use of the synthetic approach in moral philosophy became influential in the second half of the seventeenth century with Hermann Conring and his increasingly prevailing view of politics as a science (Scattola 2002, pp 305–309), although in the intervening period Zabarella's views had been more strongly embraced.

Piccolomini's *Universa philosophia de moribus* (*A Comprehensive Philosophy of Morals*), first published in 1583 but reissued in a revised edition in 1594, was a major achievement and has been described as the greatest theoretical effort with regard to ethics in the Italian Renaissance (“l’opera più consistente nella teorizzazione dell’etica durante tutto il Rinascimento italiano”; Poppi 1976, p 124). In addition to its pedagogical theory, the work is important for its view of the relationship between the branches of moral philosophy (ethics is viewed as the major, theoretical part, which is closely intertwined with politics, which however is practical; economics, the component

of moral philosophy that concerns the household, is considered an appendage to politics) and for its combination of Aristotelian, Platonic, and Stoic elements under the banner of Christianity (Kraye 2002; Plastina 2002). But the work is also significant for its reorganization of the discussion in Aristotle's *Nicomachean Ethics* (although the *Universa philosophia* is essentially a philosophical commentary in the scholastic vein, Piccolomini abandons the linear approach that was traditionally associated with commentaries), for its sustained consideration of the views of past and present interpreters, for its treatment of topics such as the freedom of the will (Saitta 1961, pp 431–33), and for its unusual insights into the possible development of Aristotle's thought (Lines 2002a, b). This is the only work that Piccolomini chose to translate (or, rather, adapt) into Italian, as testified by his two manuscript works dedicated to the Medici, the *Istituzione del principe* and especially the *Compendio della scienza civile*, both of which enjoyed a fair circulation (Lines 2015).

Piccolomini's works on the soul, on natural philosophy, and on the theory of mathematics have not been studied in sufficient detail (but see Nardi 1958; Saitta 1961; Kessler 1987, 1988; Michael 1993; Claessens 2012, 2014), but it is clear that in several instances he made contributions (both in these fields and in moral philosophy) whose originality has not been properly recognized. He also gave more attention to the Greek commentators (especially Simplicius) than several of his contemporaries; he could read Greek, although he was not in any sense a philologist. These qualities have often been obscured by the tortuousness of Piccolomini's prose and his relentless use of the scholastic *distinguo*, but he is a figure who needs to be appreciated for his own merits and not simply as the competitor of Pendasio or Zabarella.

Impact and Legacy

Piccolomini was an influential teacher (as can be seen from the numerous surviving manuscripts of

his lectures; see Lohr 1988) and an important participant in various areas of philosophical discussion in the second half of the sixteenth century, including moral and natural philosophy (his works on ethics and the soul are especially important), logic, and the issues of the method in knowledge and order in education. His writings were significant both in Italy and beyond it – particularly in Germany (Kuhn 2002; Lines 2002b), where his works were well known and received several editions, although his solutions were not necessarily followed, and in Scandinavia (Mikkeli 2002).

Bibliography

Primary Literature

Manuscript Works

Note: for Piccolomini's numerous Latin lectures and other similar works that have remained in ms., see Lohr 1988, 332–342.

Piccolomini, F. 1602. *Instituzione del principe*. Work completed and sent to Florence; dedicated to prince Cosimo (the future fourth Grand Duke of Tuscany). MSS: Florence, BRicc. 2589, ff. 1r–40r (presentation copy) and 7 further mss. Edited in Piccolomini 1858, 1–40; for the dedication only see also Battistini, M. 1915. Francesco Piccolomini e un suo scritto educativo per il Gran principe di Toscana. *Bullettino senese di storia patria* 22:334–338. Further comments in Lines 2015 (mss and further references in n. 15).

Piccolomini, F. 1604. *Compendio della scienza civile*. Work completed and sent to Florence; dedicated to the Grand Duchess of Tuscany, Christina of Lorraine. MSS: Florence, BNC, Conv. Soppr. E.5.867, 110 folios (autograph presentation copy) and 8 further mss. Edited in Piccolomini 1858, pp 41–194. Further comments in Lines 2015 (mss and further references in n. 26 and n. 56).

Printed Works

Note: this listing is derived from Lohr 1988, 332–342, which in several cases provides further details.

Duodo, P., 1575. *Peripateticae de anima disputationes*. Venice.

Piccolomini, F. 1583. *Universa philosophia de moribus*. Venice (rev. ed. in 1594). Subsequently printed in 1596 (no place) and Frankfurt 1627 (see Lohr 1988, 342). Partial English translation in Kraye, J. 1997. Francesco Piccolomini. In *Cambridge translations of Renaissance philosophical texts. Moral philosophy*, vol 1, ed. Kraye, J., 68–88. Cambridge.

Piccolomini, F. 1594. *Comes politicus pro recta ordinis ratione propugnator*. Venice: Apud F. de Franciscis.

Piccolomini, F. 1596. *Librorum ad scientiam de natura attinentes pars prima [–quinta]*. Venice. Further eds. in Venice and Frankfurt as well; that of Frankfurt 1628 bears the title *Naturae totius universi scientia perfecta atque philosophica* (see Lohr 1988, 341; comments in Claessens 2012).

Piccolomini, F. 1600. *De rerum definitionibus liber unus*. Venice (also Frankfurt 1600 and 1611, the latter with title *De arte definiendi et eleganter discurrendi*). Some comments in Lines 2015.

Piccolomini, F. 1602a. *Librum Aristotelis De ortu et interitu lucidissima expositio, multiplici annotationum varietate amplificata*. Venice. Further eds. in Frankfurt and Mainz under various titles (see Lohr 1988, 337–338).

Piccolomini, F. 1602b. In *III libros Aristotelis De anima lucidissima expositio, multiplici annotationum varietate amplificata*. Venice. Further eds. in Frankfurt and Mainz under various titles (see Lohr 1988, p 340).

Piccolomini, F. 1603. *Discursus ad universam logicam attinens*. Marburg: Egenolph.

Piccolomini, F. 1606. *Octavi libri naturalium auscultationum perspicua interpretatio, multiplici annotationum varietate illustrata, nunc primum in lucem edita*. Venice: Apud Ioan. Antonium & Iacobum de Franciscis.

Piccolomini, F. 1607. In *libros Aristotelis De caelo lucidissima expositio, multiplici annotationum varietate amplificata*. Venice; rpt. Mainz 1608 with title *Commentarii in libros Aristotelis De caelo, Ortu et interitu, adiuncta lucidissima expositione in III libros eiusdem De anima*.

Piccolomini, F. 1858. In *Breve discorso della istituzione di un principe e Compendio della scienza civile di Francesco Piccolomini con otto lettere e nove disegni delle macchie solari di Galileo Galilei*, ed. Pieralisi, S. Rome.

Tiepolo, S., 1576. *Academicarum contemplationum libri decem*. Venice.

Pico della Mirandola, Gianfrancesco

Born: 1469, Mirandola or Ferrara

Died: 1533, Mirandola

Marco Piana

McGill University, Montreal, QC, Canada

Abstract

Gianfrancesco II Pico della Mirandola, Duke of Mirandola and Count of Concordia, is a sixteenth-century philosopher, theologian, poet, and political figure, attributable to the Savonarolan movement of the Piagnoni. He is often referred to as one of the first Renaissance intellectuals to rediscover Sextus Empiricus and employ Pyrrhonian skepticism in their philosophical treatises. He is also known as the official biographer of friar Girolamo Savonarola, and as the biographer/editor of his uncle, Giovanni II Pico della Mirandola. His philosophical and religious views, in continuous dialogue between humanist curiosity and Savonarolan devotion, characterize him as a fierce antagonist of the numerous attempts at finding concord between ancient and early

modern forms of knowledge and belief pursued at the time.

Biography

Born in 1469, son of Galeotto I Pico (1442–1499) and Bianca Maria d’Este (1440–1506), Gianfrancesco, future lord of Concordia, was just six years younger than his uncle Giovanni Pico (1463–1494), from whom he managed to buy the hereditary title to the lands of Mirandola. The deep relationship between the two Picos, uncle and nephew, is manifest not only in Giovanni’s will, dated 1491, but also in the letters the two men exchanged during Giovanni’s last years (Schmitt 1967). We find further proof of this close friendship in the fact that Giovanni himself tasked his nephew to continue his unfinished philosophical debate, after *De ente et uno*. Gianfrancesco’s contribution to Giovanni’s philosophical *querelle* with Antonio Cittadini da Faenza can be found in the various editions of his own works (Pico della Mirandola 1972). In fact, the bond of affection and esteem between the two men remained unchanged until the abrupt and unfortunate death of Giovanni in 1494. After Giovanni’s passing, Gianfrancesco became his official biographer and editor, inheriting de facto a wide network of friends and contacts in the courts of Florence and Ferrara. Among these contacts, it is important to stress the presence of Marsilio Ficino, who wrote a letter of condolences to Gianfrancesco after the death of Giovanni Pico (Pico della Mirandola 1972), Girolamo Benivieni, who dedicated an edition of his works to Gianfrancesco, Aldo Manuzio, Matteo Bosso, Pietro Crinito, Domenico Grimani, Filippo Beroardo the Elder, Battista Guarino, and Ercole Strozzi (Schmitt 1967).

During his early life and after the death of his uncle, Gianfrancesco followed the guidance of a new teacher, one of the most important figures of early modern philosophy and a man who has profoundly marked the development of the Italian Renaissance: Girolamo Savonarola (1452–1498). From early adulthood, in fact, Gianfrancesco had

shown the signs of deep religious faith, an attitude that was further developed under the strong influence of both his humanist mentors, his uncle Giovanni Pico and the friar Savonarola. Notwithstanding the strength of the ties that bound uncle and nephew, nothing proved as significant as the teachings of Girolamo Savonarola for the development of Gianfrancesco's philosophical outlook. Despite the Dominican friar's fate – he was excommunicated by Pope Alexander VI (1431–1503) and then executed as a heretic in 1498 – Pico's affection for him and his ideas remained unchanged throughout the years. For example, during the period when this religious reformer was under attack, Pico wrote three apologetic defenses in his honor. The first, *Invectiva in prophetiam fratris Hieronymi Savonarolae*, was published in Milan in 1497 and reprinted in 1498 as *Defensio Hieronymi Savonarolae adversus Samuelem Cassinensem*. Another defense, named *Opusculum de sententia excommunicationis iniusta pro Hieronymi Savonarolae prophetae innocentia*, was written right after the friar's excommunication in May 1497, and was dedicated to Ercole d'Este. In 1498, however, when Savonarola's situation further deteriorated, Pico felt obliged to write a third and last defense of Savonarola, this time in Italian: the *Epistola del conte Zuanfrancesco da la Mirandola in favore de fra Hieronymo da Ferrara dappoi la sua captura* (Schmitt 1967). Furthermore, after the preacher's conviction and death in 1498, Gianfrancesco wrote his biography, a piece of writing that circulated in manuscript form from the beginning of the sixteenth century until its publication in 1674. Even after the death of the Dominican friar, Pico never stopped helping the Savonarolan cause. In 1501, Gianfrancesco drew up a defense of Pietro Bernardino (1475–1502), a controversial follower of Savonarola who had found refuge in Mirandola. Pico, moreover, offered ample support to the Savonarolan “living saint” Caterina Mattei da Racconigi (1486–1547), although the questionable conduct of the religious woman had already led to an interrogation by the court bishop of Turin in 1512.

When it comes to Pico's political life as the lord of Mirandola, extant documents give

evidence of a ruler marked by complexity and controversy. About a year after the death of Savonarola in 1498, Pico's own father died, leaving Gianfrancesco in a difficult position. In the years of his father Galeotto I's dominion, there had been several family disagreements over the rights of inheritance of the Duchy of Mirandola and the County of Concordia. In order to avoid future issues in matters of succession, in 1491 Gianfrancesco's younger brothers, Lodovico (1472–1509) and Federico, forfeited their right of succession. In the same year, Galeotto had been able to obtain the investiture of Emperor Maximilian I (1459–1519) to the domain of Mirandola and the surrounding areas together with the right of succession for his eldest son, Gianfrancesco. Following this new acquisition, Antonmaria, Galeotto's brother, tried in vain to gain the support of the Emperor, who rejected his request and confirmed Galeotto as lord of Mirandola. After his father died in 1499, therefore, Gianfrancesco inherited the coveted title. For precaution's sake, the young lord requested – and obtained – a new investiture by Maximilian I. Despite the Emperor's support, however, Gianfrancesco then faced the insurrection of his two younger brothers, who formed a coalition in order to take Mirandola forcefully. After several unsuccessful attempts, Lodovico and Francesco finally managed to conquer the region in 1502 with the help of their ally Gian Giacomo Trivulzio (1441–1518), forcing Gianfrancesco to exile.

Gianfrancesco's long period of banishment had a major impact on his life and marked his philosophical development in a profound way. During his eight years of exile, Pico managed to visit some of the most important courts of his time, especially the Imperial and Papal courts, allowing him to establish new, strong bonds with the intellectual milieus orbiting around these two cultural epicenters. Gianfrancesco visited the Emperor twice, in 1502 and in 1505. He did so mostly to gain support for his claim over the lands he had lost to his brothers. During his short stays, Gianfrancesco had the opportunity to get acquainted with some of the most important German philosophical and theological figures of the time, notably Johann Reuchlin

(1455–1522), Conrad Celtis (1459–1508), Beatus Renanus (1485–1547), Willibald Pirckheimer (1470–1530), Jacob Wimpfeling (1450–1528), and Thomas Wolf (Schmitt 1967). Wolf was also instrumental in the printing, distribution, and overall success of Pico's writings in Germany. The Emperor's seat in Germany was not the only pilgrimage site that Gianfrancesco visited several times. Indeed, another court had been very decisive in his quest for political support: that of Pope Julius II.

Despite the obvious differences of opinion that divided the two men in matters regarding faith and dogma – on that point, Pico notably accused the pontiff after his death – Gianfrancesco found in Julius II a solid political ally when his army allowed him to enter Mirandola once again in 1511, although only for a short period (Cao 2004). His first official visit to the Pope took place between 1508 and 1509. The reason for such a visit was simple: convincing the Pope to free Mirandola with his army lodged in Bologna. Although this visit did not have any immediate consequence, it nevertheless allowed Pico to start building a relationship with Julius II and his entourage. It is unclear if the second visit to the papal court between 1511 and 1512 had a major impact on Gianfrancesco's political troubles. However, his long stay in Rome allowed him to give a precious testimony to some of Julius II's greatest architectural and propagandistic works. Moreover, while stationed at the papal court, Gianfrancesco wrote one of his most influential works, the collection of *epistulae* between him and the Cardinal Pietro Bembo (1470–1547), eventually known as the *De imitatione* (Pico della Mirandola et al. 1954). With the death of Julius II in 1513 and the beginning of Leo X's (1475–1521) pontificate, Gianfrancesco thought he had found a better interlocutor, not only for his political claims but also, and more importantly, for his exhortations towards a moral reformation of the Church. For this very reason, Pico, once again in control of Mirandola thanks to the help of the imperial vicar bishop Matthew Lang of Wellemburg (1469–1540), strived to gain the new Pope's trust and support. Gianfrancesco's works *De amore divino* (1516) and *De*

reformandis moribus (probably written between 1513 and 1515, but printed only in 1520), two pieces of deep theological and moral value, were both dedicated to Leo X. The same can be said of the treatise *De veris calamitatum causis nostrorum temporum*, published after Leo X's permission to establish a printing press in Mirandola.

Between 1514 and 1533, Pico's main political controversies seemed resolved. Thanks to a diplomatic agreement with his family overseen by Bishop Matthew Lang, the duke of Mirandola finally ruled over part of his lands. After the long-awaited opportunity to rule, Pico quickly showed his religious and political inclination to the world. As a ruler, in fact, Gianfrancesco made continuous efforts to protect Savonarola's sympathizers, a clear sign of his unbroken devotion and dedication to the Savonarolan ideal. While he was helping alleged Savonarolan heretics, lamenting the unjust execution of friar Girolamo, and even interceding in support of a controversial holy woman, Caterina da Racconigi, Pico showed no remorse when it came to justifying his harsh treatment of heretics and vehemently denouncing Luther as "the worst heresiarch in history." He also enthusiastically supported the campaign against witchcraft initiated in Mirandola in 1522 by Girolamo Armellini (1470–1550), the filo-Savonarolan inquisitor of Reggio and Parma. In April of 1523, friar Luca Bettini, one of the Savonarolan radicals protected by Pico, was appointed vicar of Armellini. Finally united by their intent to eradicate sorcery and heresy, the inquisitor and the vicar tried more than 60 suspects and, with full support from Gianfrancesco Pico, they ordered the execution of seven women found guilty of witchcraft in 1522 and 1523. Gianfrancesco, who had expressed concerns about magic and witchcraft in some of his early works, was closely involved in the prosecution and, with the help of Armellini and Bettini, even interrogated some of the accused himself. His personal involvement in the different trials was clearly political, since some of the suspects lived in the domain of Francesca Trivulzio (1475–1560) and his patron, the Marquis of Mantua, who tried in vain to prevent the prosecutions

against them. In response to the growing criticism following the witch trials in Mirandola, Pico wrote the best-known book on witchcraft of the Italian Renaissance: *Strix, sive de ludificatione daemonum* (Bologna, Hieronymus de Benedictis, 1523). Promptly translated by friar Leandro Alberti (1479–1552) in 1524, the book became the first treatise on witchcraft published in the vernacular in Italy. Pico, among others, argued that witches were part of a heretical sect and praised the inquisitors who strove to exterminate them, while immortalizing Armellini as the figure of the judge in this dialogue. As examples of this book's tangible influence throughout the century, inquisitors such as Bartolomeo Spina (1474–1546 ca.) and important demonologists such as Jean Bodin (1530–1596), later referred to the *Strix* as a fundamental work on demonology and witchcraft.

After a life of political struggles, Gianfrancesco's dominion over Mirandola found a brutal end on 16 October 1533, the day his nephew, Galeotto II Pico (1508–1550), entered the castle of Mirandola, murdered Gianfrancesco and his son Alberto (1519–1533), and imprisoned his wife and the other family members. From the writings produced in the last years of his life, little remains but a meager collection of letters, mostly due to the dispersion of Gianfrancesco's library after Galeotto's siege and sack of the castle. This period was, however, far from uneventful. Indeed, Pico died a few years after the sack of Rome (1527) and the capitulation of the Republic of Florence (1530). It was the end of the age of strife that marked the beginning of the sixteenth century, an age that found one of its most iconic personalities in Gianfrancesco Pico.

Innovative and Original Aspects

One of the most innovative aspects of Gianfrancesco Pico's work can be found in his own unique narrative of Christian and pagan antiquity. Whereas many other Renaissance humanists, following in the footsteps of early apologists such as Justin Martyr and Eusebius of Caesarea, welcomed the rediscovery of ancient philosophical

knowledge and tried to incorporate such knowledge into inclusivist philosophical/theological grand narratives indicated as *Prisca theologia*, *Pia Philosophia*, and *Philosophia perennis*, Pico used his humanist education to provide philosophical proof that – regardless of its apparent beauty and complexity – pagan knowledge was fallacious, deceptive, and demonic in nature.

Following the teachings of Augustine of Hippo and other Church Fathers, Pico adhered to the idea that Christianity was de facto the most ancient and perfect religion, and that Jesus Christ was sent to restore the ancient creed after it had been abandoned due to the influence of demonic entities, which the pagans worshiped as their gods. Unlike other representatives of Christian irenicism such as Justin Martyr, however, Pico never accepted the fact that the ancient religion could survive in the words of certain pagan philosophers, inspired by the eternal *Logos*. Pagan antiquity, for Gianfrancesco Pico, was a long period of silence between God and most of humanity. Thus, he dedicated a great part of his life to showing his contemporaries that Christianity could not be reconciled with pre-Christian antiquity. This line of thought, which is presented most clearly in his *Examen vanitatis doctrinae gentium* (1523), shines through the entirety of Gianfrancesco Pico's work. Treatises like *Strix, sive de ludificatione daemonum* and poems like the *Hymni heroici tres*, *Staurostichon*, and *De Venere et Cupidine expellendis*, moreover, allow the reader to gaze into Pico's personal vision of pagan antiquity as a dystopian world where mortal vanity and madness enslaved humanity to Satan's will. Often inspired by apocalyptic anxieties and millenarist ideas, moreover, Pico's writings present this world as on the verge of returning, due to the resurgence of the same knowledge that condemned humanity in the days of old. This fervent critique of past and present "paganisms" is driven by the author's personal crusade of converting the intellectual elites of his time to a Savonarolan form of pietas, devoid of any pagan influence. Unlike Savonarola, Pico had little interest in guiding the common people toward his master's faith. With the loss of Florence and Savonarola's gruesome death, Pico saw the

clergy, the nobility, and the humanists as the only classes worthy of converting. Just like father Zanobi Acciaiuoli, another influential follower of Savonarola, Gianfrancesco Pico decided to fight his religious battle inside the courts rather than in the city squares.

The most groundbreaking tool used by Pico in his personal attack on ancient philosophy is certainly that of Pyrrhonian skepticism. Binding the skeptical arguments of Sextus Empiricus to Savonarola's critical view of natural knowledge, Gianfrancesco Pico was the first modern author since antiquity to utilize a Pyrrhonic approach in his theses (Popkin 2003). As Charles Schmitt asserted, the young lord of Mirandola must have read Sextus in a Greek manuscript, long before his work was published in Greek or Latin (Schmitt 1967). His use of ancient skepticism, however, is extremely peculiar, as it is employed to undermine confidence in human understanding and celebrate divine inspiration as the only true form of knowledge. In Pico's view, in fact, since humanity is unable to comprehend anything by rational means, the only source of knowledge must be divine revelation received through the sacred art of prophecy. This radical form of fideism is, to say the least revolutionary since – as noted by Popkin – it posits prophets as the only arbiters of truth, thus rejecting the claims of the Church as the sole true interpreter of God's revelation through the Sacred Scriptures (Popkin 2003).

Impact and Legacy

The importance of Gianfrancesco Pico as a humanist and political figure was manifest in the eyes of his contemporaries – as his extensive correspondence suggests – and his success as a writer continued until the beginning of the eighteenth century. During the last century, however, Pico's work has mostly been discussed by historians of philosophy interested in Renaissance skepticism and its developments. Charles Schmitt successfully traces Pico's philosophical influence in the works of Mario Nizolio, Giulio Castellani, the translator of Sextus Empiricus Gentian Hervet, Giovanni Battista Bernardi, Paolo Beni,

the authors of the Coimbra Commentaries, Filippo Fabri, Mersenne, Pierre Gassendi, Campanella, and Leibniz (Schmitt 1967).

Pico's importance as a biographer and apologist, however, must not be underestimated. Pico's *Life of Savonarola* (1496) has been long revered by the secret sympathizers of the Dominican priest's cause (Pico della Mirandola 1999) and freely circulated in Protestant territories and communities. His *Life of Giovanni Pico della Mirandola* (1496), moreover, received immediate attention and praise, up to the point of being edited and translated in 1510 by Thomas More. Gianfrancesco Pico's influence and agency as the editor of his uncle Giovanni Pico's works continues to be an important and controversial matter today. Giovanni Pico's *Disputationes adversus astrologiam divinatricem*, published posthumously by Gianfrancesco, has lately been accused of being utterly modified by the latter to fit a more Savonarolan form of pietas (Garfagnini 2004).

During his turbulent life, Gianfrancesco Pico managed to write extensively about a great number of matters that characterized the high culture of his time. Following in his uncle's footsteps, the young Pico was extremely active in the Renaissance diatribe on astrology. On this subject, he wrote two treatises – *De rerum praenotione* (1507) and the short *Quaestio de falsitate astrologiae* (1505–1514) – and a poem dedicated to Emperor Maximilian I known as *Staurostichon* (1505–1507). During the second decade of the sixteenth century, Pico developed an articulated critique on the concept of Platonic love, resulting in the publication of the treatise *De amore divino* (1516) – dedicated to Pope Leo X – and the poem *De Venere et Cupidine expellendis* (1513). He also wrote several theological works in defense of Savonarolan piety, such as *De morte Christi et propria cogitanda* (1496), *Theoremata numero XXV de fide* (1506–1507) – dedicated to Pope Julius II – and the famous *De reformandis moribus oratio* (1514 – published in 1520), a short oration addressed to Pope Leo X and the assembled Lateran Council, that would circulate widely, particularly in Germany, as propaganda for the cause of the Reformation (Schmitt 1967;

Cao 2004). Although the attribution of Pico's late work on alchemy – *De Auro* (published posthumously in 1586) – has been considered uncertain for a long period; later scholarship has brought new contextual proof of its possible authenticity (Secret 1976). If so, Pico's work must be acknowledged as a unique text among the vast production of alchemical treatises of the sixteenth century.

Pierozzi, Antonino

Born: Florence, March 1389, to Niccolò di Pierozzo and Tommasa di Cenni di Nuccio Brunetti

Died: Florence, 2 May 1459

Peter Howard

Monash University, Melbourne, VIC, Australia

Abstract

Antonino Pierozzi (hereafter, Antoninus) was a Dominican friar renowned for his achievements as a reformer, as a theologian, and for being “a mirror of holiness” to whom (according to a contemporary) crowds of devotees flocked. Antoninus was educated and later preached within the dynamic intellectual context associated with Renaissance humanism. He not only had a unique library at his disposal in the newly rebuilt convent of San Marco (1442-) but was well placed to understand the anxieties of Florentine citizens in relation to an inherited tradition. Fra Antoninus, like other successful preachers, acted as a cultural translator: he distilled, reclassified, and concretized ideas circulating in learned circles according to the circumstances most relevant to his audience (*de circumstantiae*). His intellectual engagement with the catholic theological and canonical traditions in terms of his own milieu is best exemplified by his monumental *Summa theologica*.

Alternate Names

[Antoninus of Florence](#)

Biography

Antoninus received the Dominican habit at Santa Maria Novella, Florence, in 1403, at the hands of

his mentor, Giovanni Dominici (1356–1419), and was sent immediately to the convent at Cortona for his year-long novitiate. In 1406 he was transferred with other young professed friars to San Domenico di Fiesole. His career encompassed important roles in his own Dominican order, including prior of convents at Cortona (1417–1422), Naples (1426–29), and Florence (1436–1440) and Vicar General of the Observant Dominicans in Italy (1431, 1436/7–c. 1446). He was auditor general of the Holy Roman Rota under Pope Eugenius IV (c. 1432–1446) and was appointed archbishop of Florence by the same pope in 1446 and presided over the city during the period most associated with the Florentine Renaissance (Morçay 1913; Orlandi 1959; Cinelli and Paoli 2012). He was canonized by Pope Adrian VI in 1523 (Polizzotto 1992).

Heritage and Rupture with the Tradition

As a reformer (Peterson 1985; Peterson 1989a), Antoninus was inspired by Giovanni Dominici, his “famous, learned” master “who was the first in Italy to raise and revive the life of the regular observance in the Order of Preachers” (Antoninus, *Summa theologica*, 1740/1959). As a thinker, Antoninus deprecated himself as someone “without the genius for higher things” with his education limited to local Dominican *studia* (Cortona and Fiesole) and, for a time, the Studio Fiorentino (Howard 1995). Despite his own humility topos, he was extolled posthumously by Aurelio Bienato (1440–1496), the Neapolitan humanist, as a “second Plato,” and by the humanist pope, Pius II, for “his theological teaching” and his “numerous volumes which are praised by the learned” (Howard 2013). Though indeed lacking training in the higher *studia* of the order, Antoninus took seriously the injunction of the Dominican Constitutions that enjoined friars always to “be reading something or thinking about something, by day and by night, at home and when they are travelling.” It was in 1444 that Antoninus decided to make “things that appealed to [him] from what [he] came across whilst reading,” available to “brothers like himself,” but who were without access to books, for preaching, hearing confessions, and the care of

souls. His collation – “his harvest of holy learning” – was distributed across his four volume *Summa theologica* and its appendix, the *Summa historialis* (or *Chronicon*) (Howard 1995; Walker 1933). The former incorporated a range of treatises on key theological topics, ecclesiastical censures, excommunication, restitution, the ornaments of women, and sermons, all of which circulated independently in both manuscript and, eventually, printed form. The four parts of the *Summa theologica* traversed all relevant fields of theology, as well as explorations of pertinent moral issues. Grounded very much in the *prima pars* of Thomas Aquinas’ *Summa theologiae*, Antoninus’s own first volume moves from considerations of the nature of the soul, the essence of man and his dignity, the powers of the soul and the intellect, the nature of the will, sin, and law of various types. The second volume treats vices, while the third turns to various states of life, “lay no less than clerical,” in church and society. The fourth treats the virtues. These, along with his shorter, explicitly pastorally oriented manuals for confessors (Antoninus 1472; 1473; 1475), made his writings the most published in Europe during the incunabulum period, apart from the Bible itself (Howard 1995; Howard 2013).

Innovative and Original Aspects

The breadth of his engagement with theology is revealed at the outset of the *Summa* where Antoninus lists some of the books upon which he had drawn. No significant medieval or near contemporary theologian or canonist is omitted, and the text of the *Summa* itself reveals many more authors not initially listed. That idea for preaching, along with the Dominican tradition of up-to-date *summae* occasioned by need and circumstance and discussions in the *collationes* (pastoral discussions in local Dominican schools, i.e., *studia*), guided his reading, and copying is indicated in the published editions of the *Summa* by the phrase “per modum praedicationis” – “by way of preaching” – appended to different sections. Antoninus’s own avowed appreciation of the theological tradition was in terms of the

preachability of any particular author's material (Howard 1995). For this reason, his theological teaching could be referred to as public theology, rather than as a theology directed to the academy. The marginalia of the autograph manuscript of the *Summa theologica* reflect Antoninus's eye for material to use on particular occasions: for the third Sunday after Trinity, the day of Pentecost, etc. His way of structuring these and other parts of his treatises generally follows his preferred mode of preaching as revealed at the very outset of his *Summa*: "A verse of a psalm is taken as a theme, because it is readily at hand, because it is frequently in use in the Church, and because it lends itself to drawing together all material into doctrine" (Howard 1995; Howard 2013).

Antoninus has often, even recently, been denigrated as a mere popularizer of Thomas Aquinas who ostentatiously quoted the latter while advancing moral theology as a separate category rather than an integral part of it. This is, in part, a reflection of the way in which Antoninus casts his compendium of theology in familiar theological categories, as had happened with the generation of Thomas's students, for example, Henry of Rimini (fl. 1308) upon whom Antoninus draws extensively in the fourth part of his *Summa*, along with a local tradition of civic preaching that harked back to Remigio de' Girolami (fl. c. 1300), and Ptolemy of Lucca (also fl. c. 1300) with a focus on "il bene commune" (bonum commune) – the common good (Howard 2013). More than his mentor Giovanni Dominici, Antoninus himself was receptive to humanist ideas and modes of thought as a basis for civic life and adopted humanist modes of rhetoric when required, particularly in his role as archbishop. He counted Leonardo Bruni (1370–1444) among his friends and drew extensively on his writings and, in his later years, appointed the humanist, Francesco da Castiglione (later a canon at San Lorenzo), as his secretary (Howard 1995; Howard 2012).

His views were more moderate than those of his contemporary, the observant Franciscan preacher, Bernardino of Siena (Cretyens 1958; Cretyens 1967). This was particularly true in the area of commercial practices (De Roover 1967). His writings reflect the capacity to weigh the

views of the different authorities – ancient to recent – and he excelled in applying his theological learning to specific circumstances and problems, and in uncertain cases, he gave the practical man of affairs the benefit of the doubt, in particular in the vexed areas of loans, usury, and exchange so that he could go about his business with good conscience. Here Antoninus's understanding of conscience as an internal conviction directing action was fundamental, since actions thus justified could even be at odds with strict doctrine, at least as then currently understood (Howard 2016).

Impact and Legacy

With his writings the most published in Europe during the incunabulum period, and his *Summa theologica* appearing in almost 20 editions between 1477 and the end of the sixteenth century, Antoninus had a profound impact. His writings often were the most up-to-date sources for thinkers on a variety of topics (Gaughan 1951; Edelheit 2014), including theories of rights, such as Conrad Summenhart's (Varkemma 2012). In the nineteenth century, Antonino's writings had a resurgence and an influence on Catholic social doctrine and the question of a broad interpretation of papal infallibility at the First Vatican Council.

Pietro da Bergamo

Born: Early XV century, Bergamo

Died: 15 October 1482, Piacenza

Lorenzo Filippo Bacchini

Department of German and Roman Languages and Literatures, John Hopkins University, Baltimore, MD, USA

Abstract

Pietro dall'Almadura or dalla Maldura, known as Pietro da Bergamo, was born in Bergamo in the early decades of the fifteenth century and was an important Italian Dominican theologian. At an early age, he entered the Dominican convent of St. Stephen, in Bergamo, where he began his philosophical and theological education, which he completed in the Dominican convent of Bologna, where he especially deepened his knowledge of the thoughts and works of Thomas Aquinas. He was a priest and teacher and had illustrious students such as Domenico from Fiandra,

Paolo from Soncino, and Girolamo Savonarola. He died on October 15, 1482, in Piacenza.

His major work, published for the first time in 1473 in Bologna, is the *Tabula*, later defined *Aura*: the most comprehensive and widespread Thomistic *tabula* of its era. He also published the *Ethimologiae sive Concordantiae dictorum atque conclusionum divi Thomae de Aquino* and the *Confessione cavata de l'Antonina*.

Alternate Names

da Bergamo, Pietro; d'Almadura, Pietro; de Bergomo, Petrus; Bergomensis, Petrus; de Bergamo, Petrus; Almadura da Bergamo, Pietro; dall'Almadura, Pietro; dalla Maldura, Pietro

Biography

Pietro dall'Almadura or dalla Maldura, known as Pietro da Bergamo, was a significant Italian Dominican theologian. He was born in Bergamo in the early decades of the fifteenth century to Baldassarre, but there is no reliable information regarding his exact year of birth. The information concerning his life is few and fragmentary. At an early age, he entered the Dominican convent of St. Stephen, in Bergamo, where he began his philosophical and theological education. Around the middle of the century, he was sent to the Dominican convent of Bologna, an important center for the study and dissemination of the Thomistic doctrine, where he perfected his theological training, especially deepening his knowledge of Thomas Aquinas' thoughts and works. In 1459, the Bishop of Ventimiglia, Giacomo da Savona, ordained him priest. Three years later, in 1462, he became a teacher and in 1465 was appointed Master of the Sentences for the years 1466 and 1467. In 1471, Peter obtained his Masters in "sacra theologia" becoming a Lecturer of Theology and until 1477 wielded the post of Bachelor of the Studium. He had illustrious

students, including Bartolommeo Comazzi, Vincenzio Bandelli, Domenico da Fiandra, Paolo da Soncino, and Girolamo Savonarola. He died on October 15, 1482, in the Dominican convent of Piacenza. The city of Piacenza erected a tomb for him near the altar of St. Thomas, in the convent church, and in 1485, his remains were moved under the altar of the Dominican church of S. Giovanni in Canale (see Falzone 2007; Mazzuchelli 1753 - 1763; Piana 1963; Ridolfi 1981).

All of his published writings deal with the works of Thomas Aquinas. His major work is the *Tabula*, later called *Aurea*, published for the first time in Bologna by Baldassarre Azzoguidi in 1473. The *Tabula* is the most complete and widespread Thomistic *tabula* of its era and offers a list, in alphabetical order, of entries, accompanied by references, in order to facilitate the discovery of the places associated with those entries. Under each lemma (*dictio*) all propositions (*sententiae*) which relate to it are grouped, assigning each of them an item number (see Guyot - Sterli 2003; Kaeppli 1980; Sterli 1995).

The *editio princeps* of the *Tabula* was quickly followed by two reprints: one in 1478 and another in 1495, both in Basel. A new edition, greatly enlarged and enriched with an *Index auctoritatum*, was later published in 1497 by Ambrogio Corradi, Peter's *confratello*. A new and further enhanced edition appeared in the edition of St. Thomas's works published by order of Pius V in Rome, in 1571, the so-called *editio Piana*. The *editio Piana* has been the basis of all the editions of the *Tabula*, until the 1880 Paris and 1960 Roman editions (see Guyot - Sterli 2003; Kaeppli 1980; Sterli 1995).

After publishing the *Tabula*, Peter published in Venice, in 1476, the *Ethimologiae sive Concordantiae dictorum atque conclusionum divi Thomae de Aquino*, a small volume in which Peter collected and attempted to reconcile 1222 apparently discordant propositions from the works of Thomas Aquinas. He also left a *tabula* written for the use of confessors, the *Confessione cavata de l'Antonina*, which contains a list of sins

divided according to the commandments, the capital vices, the works of mercy, and the violations of duties (see Falzone 2007; Mazzuchelli 1753 - 1763; Ridolfi 1981).

It appears that Peter also wrote many other secular and religious works, which, however, have never been published and were exclusively used internally in Dominican convents (see Mazzuchelli 1753 - 1763).

Pio, Alberto III

Born: 1475, Carpi

Died: 1531, Paris

Fabio Forner

Dipartimento di Filologia, Letteratura e Linguistica, Università degli Studi di Verona, Verona, Italy

Abstract

Alberto Pio, Prince of Carpi, had a humanistic education under the direction of Aldo Manuzio. He promoted the studies on the Aristotelian corpus, supporting the works of many young scholars on Aristotelian texts. He gave a key contribution to the publication by Aldo Manuzio of the *editio princeps* of the works of Aristotle. Moreover, Alberto Pio wrote two pamphlets against Erasmus of Rotterdam and Martin Luther. The success of his works in Catholic countries greatly influenced the creation of a collective image of Erasmus as the father of the Reformation and friend of Luther.

Biography

Alberto Pio, the son of Leonello and Caterina Pico, was born on July 23, 1475, in his ancestral castle in Carpi (Braghirolli 1877, p. 342; Semper et al. 1882, p. 3; Semper et al. 1999, p. 257, footnote 4). Only 2 years later, in 1477, he lost his father and was then entrusted to the protection of the other lord of Carpi, his father's brother, Marco Pio. Alberto's relative favored his son Giberto in the succession of the principality of Carpi (Semper et al. 1882, p. 3). However, since early childhood, Alberto had an exceptional educational experience, which was to leave an indelible mark on his personality (Silingardi 1876, pp. 66–69; Semper et al. 1882, p. 3; Morselli 1939, p. 7). He did not have a military education. At the express wish of his mother Caterina and on the suggestion of Giovanni Pico della Mirandola, Aldo Manuzio became the tutor of Alberto. The

Pigo, Azariah ben Ephraim

- [Figo, Azariah ben Ephraim](#)

learned Marco Musuro (1470–1517) was Alberto's teacher of Greek for some time during his stay at Carpi, probably until 1502 (Schück 1862, p. 107; Dionisotti 1975, p. 343 footnote 3; Vasoli 1978, p. 14; Sabattini 1994, p. 10; cf. Lowry 1986, p. 377; Pagliaroli 2004, pp. 213–93; Vasoli 2008, pp. 17–25; Pellegrini 2012, pp. 576–582).

Probably as early as in the mid-1480s, Alberto Pio was able to make numerous trips to Ferrara, where he had the opportunity to study and further his cultural interests.

Alberto was unable to devote his entire life to his studies, since, as heir of a part of a small Italian state, he was involved in the complex events that troubled the political structure of the peninsula between the end of the fifteenth and the beginning of the sixteenth century. In 1490, with the support of the Gonzaga and Pico families, Alberto received the investiture of half the domain of Carpi from Emperor Frederick III, but clashes with Marco Pio and his sons, who wanted to rule over the whole Carpi, incessantly continued (Svalduz 2001, pp. 62–135). After 1494, with the death of his legal guardian Marco Pio, Alberto intensified his administrative activities, becoming more independent, as revealed by numerous letters, which he used to weave a subtle web of diplomatic relations. The young lord's influential connections in pursuing this policy were the Marquis of Mantua, Francesco Gonzaga, and the Este family, in particular Duke Ercole I. The skillful diplomatic plots woven by the young Alberto obtained him imperial benevolence and reached the goal of preventing Giberto to steal his possessory rights to Carpi. However, on July 16, 1499, Giberto transferred the rights to his half of Carpi to the Duke of Ferrara. From that moment on, Alberto was forced to divide his power over Carpi with Ercole I d'Este. It is no coincidence that, at that time, Alberto began to function as a true diplomat. He realized then that the fate not only of Carpi but of the whole peninsula was to be decided between Paris and the imperial court (Sabattini 1994; cf. Forner 2005, p. 69). Upon request of Francesco Gonzaga, between 1505 and 1506, Alberto began a diplomatic mission at the court of King Louis XII of France. The

mission failed, but from then on, Alberto Pio became one of the most prominent Italian diplomats (Rombaldi 1977, pp. 15–16). In 1507 he met Pope Julius II, who appreciated his eloquence, his culture, and, above all, his ability in handling political affairs. In April 1507, he was in France on behalf of the Holy See; in August of that year, he returned to Rome as a French ambassador. As a result of his diplomatic activity, on June 14, 1509, Emperor Maximilian dispossessed the Duke of Ferrara of his half of Carpi and made Alberto sole ruler of the town, also bestowing on him the title of count and the right to coin money and to confer degrees (Semper et al. 1882, p. 6; Rombaldi 1977, pp. 17–18; Sabattini 1994, pp. 35–36). However, clashes with the Duke of Ferrara continued relentlessly. They ended only when the imperial troops in 1512, ousting the Duke of Ferrara, rapidly occupied the town and returned it to Alberto, who, from that moment on, became again the only master of Carpi (Sabattini 1994, p. 46). The years between 1513, with the election to the papacy of Giovanni de' Medici (Leo X), and 1519, when Charles of Habsburg was elected emperor, marked the heyday of Carpi and its lord. At that time, Alberto resided mainly in Rome, where, in 1518, he had married Cecilia Orsini, a relative of Leo X, thereby consolidating his relationship with the Pope (Sabattini 1994, p. 49).

His situation changed abruptly in 1519 with the election of Emperor Charles V. He was driven by strong distrust of the Prince of Carpi, who was considered unreliable because of his previous dealings with the French. Alberto's failed confirmation as imperial ambassador inaugurated his inexorable decline and fall. The Prince of Carpi, however, remained in Rome, officially at the service of Leo X, but secretly working in the service of the French. On January 3, 1523, Alberto was officially ousted from his possessions by the commander of the imperial army, Prospero Colonna, who confiscated all of Pio's assets. Alberto was then forced to link his fate to the King of France, in an attempt to save his property. However, the disastrous defeat of the French army at Pavia (February 24, 1525) greatly weakened the French influence in Italy and with it the hopes of Alberto

Pio (Semper et al. 1882, pp. 13–15; Rombaldi 1977, pp. 32–36; Sabattini 1994, pp. 71–72). From Rome, the deposed Prince of Carpi still tried to regain his possessions, but without success. During the Sack of Rome (1527), his palace was sacked, and Alberto, after a short stay at Castel Sant'Angelo with the Pope, was forced to take refuge in France, first at Lyon and then in Paris. There he dedicated the last years of his life to the controversy with Erasmus of Rotterdam. He died on January 8, 1531. He published a first *Resposio paraenetica* (1529) and the posthumous *Tres et viginti libri* (1531) (Minnich 1996; Forner 2009a; Forner 2014).

Heritage and Rupture with the Tradition

The education of Alberto Pio, led by Aldo Manuzio, is fully placed in the humanistic tradition, geared to the study of classical languages. However, Alberto cultivated a strong interest in the works of the philosophers of every age and later on was also a promoter of philosophical studies and in particular of Aristotelianism.

Alberto was educated to the inherent familiarity with the great literary and philosophical tradition of the classical world and had a sure knowledge not only of Latin but also of Greek. An essential part of his education was represented by the reading of medieval philosophical texts, which revealed the influence on his education of the cultural interests of his maternal uncle Giovanni Pico della Mirandola. Alberto Pio made profitable use of all this knowledge in his controversy with Erasmus of Rotterdam (Dionisotti 1964, 220 ff; Vasoli 1978, pp. 16–19; Kristeller 1965, pp. 84–107; Forner 2002 passim). Throughout his life, Alberto collected numerous Greek and Latin manuscripts (Mercati, 1938; Di Pietro Lombardi, 2004, pp. 215–227). The last decade of the fifteenth century was particularly important in the intellectual formation of Alberto Pio. In that period, he lived in Carpi (where, as mentioned above, he had exceptional tutors) and in wealthy Ferrara. Duke Ercole I d'Este had led the city at the height of its development and attracted artists and scholars among the

most learned men of that time. In Ferrara, Alberto met and established friendship, among the others, with Ludovico Ariosto, Jacopo Sadoletto, Pietro Pomponazzi, Celio Calcagnini, Pietro Bembo, Thomas Linacre, and Ercole Strozzi (Morselli 1931, pp. 93–112 on the teachings of humanities at the University of Ferrara; Sottili 1998, xv–xvi). From 1513 onwards, Alberto lived mainly in Rome. There, he was close to the circles of the Roman Academy and formed very friendly relations with Pietro Bembo, Jacopo Sadoletto (whom he already knew from the time of his stay at Ferrara), Girolamo Aleandro, Paolo Giovio, and Baldassarre Castiglione, as well as with renowned artists such as Bramante, Baldassare Peruzzi, and Raphael (Vasoli 1978, pp. 42–43).

During his last years in Paris, despite his age and illness, Alberto resumed his beloved studies, particularly in theology and philosophy. He needed a more in-depth knowledge of these disciplines in order to sustain his polemic against Erasmus of Rotterdam (Guaitoli 1877, p. 295; Solana Pujalte 2003, pp. 122–132).

Throughout his life, Alberto cultivated a great interest in classical wisdom, an interest, however, by no means confined to the *belles lettres*, and indeed concentrated on the works of the ancient philosophers, and also open to their medieval commentators. In this manner, he broke with the part of the humanistic movement that preferred to concentrate its attention on grammar texts or on poetic and historical works, expressing disdain for much of the medieval tradition. It should be pointed out that the only works of Alberto Pio that appeared in print were those related to the controversy with Erasmus of Rotterdam: the first was the *Epistola paraenetica ad Erasumum Roterodamum*, published in Paris in 1529, followed, shortly after the death of Alberto, by the *Tres et viginti libri*, also published in Paris in 1531.

In these two works, Alberto argued that the origin of the thought of Luther was to be found in the ancient conflict between theologians and humanists. Moreover, in his opinion, humanists gave too much importance to the study of ancient rhetoric at the expense of more robust studies in philosophy and theology. This emphasis on

ancient rhetoric, according to Alberto Pio, created the fertile ground on which the Lutheran doctrine could take root. Thus, he compared the followers of Luther and their fate to those who promoted *belles lettres* in the German-speaking lands. Alberto had carefully and patiently collected the charges against Erasmus that had already been used in the previous years by many theologians, although with little success and somewhat limited influence. In the first letter printed in 1529, Alberto, while listing all similarities between Luther's and Erasmus's thought, also seemed to hope for a recantation and clear disowning of Protestant doctrine on Erasmus's part. In the *Tres et viginti libri*, the tone of accusation against the learned Dutchman prevailed, and the work took the form of a pamphlet against Luther and all his supporters, Erasmus among them (Kristeller 1970; Gilmore 1975; Seidel Menchi 1987, pp. 43–63; Minnich 1988; Heesakkers 1993; Forner 2002, pp. xxiii–xxx).

Erasmus answered repeatedly and forcefully to these works, rightly accusing Alberto of using old ones that he had already answered. Moreover, Erasmus accused Alberto of having been secretly helped in the composition of his books by a scholar under his protection, namely, Juan Ginés de Sepúlveda. Sepúlveda, however, denied the accusation of being the ghost writer of the works of the Prince of Carpi (Solana Pujalte 2005).

Yet, Alberto Pio should not be remembered only as the author of treatises against the doctrines of Erasmus of Rotterdam and Martin Luther, even though were of primary importance. A proper evaluation of the activity of Alberto Pio must consider not only the works actually published under his name, but also all those works that he, thanks to his role as a patron of the arts, helped publish. The prefaces to the *cinquecentine* of Aldus Manutius provide an example of his patronage. Not only did Alberto finance the publication of the *editio princeps* of Aristotle in Greek (Dionisotti 1975) but also aided a large number of philosophers and theologians, such as Pomponazzi, Juan Ginés de Sepúlveda, Joannes Montesdoch, Graziano da Brescia, and Andrea Barro (cf. Solana Pujalte 2003, pp. 124–26).

Innovative and Original Aspects

Impact and Legacy

Alberto Pio was one of the few Italian scholars who openly took sides against Erasmus and Luther as early as the 1520s. Alberto Pio's arguments against Erasmus did not shine out for their originality. However, he raised the cultural level of the charges against Erasmus that were previously confined within the walls of some theological schools. The success of his works in the Catholic countries inseparably tied, for better or worse, the thought of Erasmus with that of Luther and laid the theoretical foundations for the painful and controversial inclusion of the works of Erasmus in the *Index librorum prohibitorum* after the Council of Trent (Seidel Menchi 1987, 2000; Forner 2012, 2013).

Equally important, though mediated, was Alberto's role in the field of philosophical studies, especially because of his efforts to promote studies on the Aristotelian corpus. Alberto Pio himself did not take an active role in the Aristotelianism of his time. Although he mentioned Aristotelian texts in his works, Alberto did not leave us any translations, editions, or expositions of Aristotelian texts. "However he was a patron of proponents for several different varieties of Aristotelian studies. If he was not at the forefront of Aristotelian studies himself [...] he was operating steadily and effectively behind the scenes. For that reason he must be seen as one of the more important Aristotelians in Italy during the years from the *editio princeps* to the Sack of Rome" (Schmitt 1981, p. 64). In this sense, the legacy of Alberto Pio for the Aristotelian studies and for the medieval philosophy and theology is conspicuous.

Pleasure in Renaissance Philosophy

Sabrina Ebbersmeyer
Section of Philosophy, Department of Media,
Cognition and Communication, University of
Copenhagen, Copenhagen, Denmark

Abstract

In Renaissance thought, we can observe a growing interest in and to a certain extent a rehabilitation of the notion of pleasure. This new interest can be understood as an expression of a general trait of Renaissance culture that showed a greater openness towards

worldly pleasures than in previous times, but it was also inspired by newly rediscovered texts containing Epicurean philosophy. In the course of the fifteenth century, new sources became available, such as Lucretius' *De rerum natura* and Diogenes Laertius' *De vita et moribus philosophorum*, which supported the growing engagement with Epicurean philosophy and a rehabilitation of his concept of pleasure. Humanists used different routes to rehabilitate the Epicurean notion of pleasure. One strategy was to reinterpret Epicurus's position and to level the differences with other schools of thought. Another one was to use the Epicurean notion of pleasure in order to counter rigid Stoic moral philosophy and reinterpret Christian morality, as can be seen most prominently in the works of Lorenzo Valla and Erasmus of Rotterdam. Although Renaissance authors contributed to the recognition of Epicurean pleasure, it still took some time before Epicurus and the notion of pleasure became fully accepted in Western philosophical thought.

Introduction: The New Interest in Pleasure and Epicurean Philosophy

Pleasure (*hedone*, *voluptas*) is a generic term that refers to various kinds of positive feelings, comprising sensual as well as intellectual or spiritual experiences, usually seen as in opposition to pain (*lupe*, *dolor*). In Renaissance thought, we can observe a growing interest in and to a certain extent a rehabilitation of the notion of pleasure. This new interest can be understood as an expression of a general trait of Renaissance culture that showed a greater openness towards worldly pleasures than in previous times (Ebbersmeyer 2013), as becomes evident from the art of the period (e.g., Quiviger 2010; Cole

2016), but it was also inspired by newly rediscovered texts containing Epicurean philosophy.

While the term “pleasure” plays a certain role in Platonic, Aristotelian, and Stoic moral philosophy, it is especially within the context of Epicurean philosophy that the term becomes central in moral thought. According to Epicurus, pleasure is the “beginning (*arche*) and fulfillment (*telos*) of a happy life” (*Letter to Menoeceus*, 127). Although Epicurus considers every pleasure to be good in itself, he does not think that every pleasure should be pursued or chosen. These and other ambiguous comments by Epicurus are the reason for the notorious problem of how to interpret the Epicurean notion of pleasure; and they allow for different, sometimes contradictory, interpretations. While the critics tend to focus on the bodily and sensual aspects of pleasure, those in favor of Epicurean philosophy accentuate its spiritual character.

Even though positive references to Epicurus and his conception of pleasure can be found in the philosophical thought of the Middle Ages – for example, in John of Salisbury’s *Polycraticus* (John of Salisbury 1938, 373–374) or Peter Abelard’s *Dialogus* (Abelard 1995, 136ssq. and 142ssq.) – Epicurean philosophy was, in general, met with deep distrust and regarded as a threat to Christian morality. Epicurus’s original works were exposed to severe censure and, as a consequence, became unavailable, and finally lost to a great extent. Only some letters and fragments of his numerous works survived.

During the early Renaissance, the main available sources concerning Epicurus’ conception of pleasure were the same as during the Middle Ages, namely the reports found in the works of Cicero, Seneca, and Lactantius. In the course of the fifteenth century, new sources became available that further supported the growing engagement with Epicurean philosophy and a rehabilitation of his concept of pleasure. In 1417, the humanist Poggio Bracciolini discovered a manuscript of Lucretius’ *De rerum natura* in the monastery of St. Gallen. This gradually permeated humanist culture (see Brown 2010; Palmer

2014). Marsilio Ficino, for instance, composed in his youth a commentary on Lucretius, although he says that he later committed it to the flames (Ficino 1576, I, 933). He also wrote a treatise *On Pleasure* (*De voluptate*, 1457), in which he defended the Epicurean notion of pleasure. In addition, Ambrogio Traversari completed his translation of Diogenes Laertius’ *Lives and Opinions of the Philosophers* in 1433 (Gigante 1988). The work contains in its tenth book an account of Epicurus’ life and doctrines and three of Epicurus’ letters; these allowed for a more nuanced understanding of Epicurean philosophy. However, even before these newly rediscovered texts circulated and could make an impact, one can observe a new attitude towards Epicurus and his conception of pleasure within humanist culture (Kraye 1988, 374–386).

The Rehabilitation of the Epicurean Notion of Pleasure

Humanists used different routes to rehabilitate the Epicurean notion of pleasure. One strategy was to reinterpret Epicurus’ position and to level the differences with other schools of thought. Such a reinterpretation of the Epicurean notion of pleasure can be seen already in the dialogues *On Happiness* (*De felicitate*, c. 1400) by the Paduan canonist and cardinal Francesco Zabarella. In the first dialogue, he refutes the view that happiness (*felicitas*) consists of sensual pleasure (*voluptas*). Finally, he also clears Epicurus of such a view and shows that “Epicurus is restored to accordance with the other philosophers” (Zabarella 1655, 28–31). Despite this sharp distinction between pleasure and happiness, Zabarella extensively discusses in the third dialogue to what extent the sensual pleasures of seeing, smelling and tasting can be experienced in the afterlife (ibid. 102–111).

A similar strategy, though not within a religious but a civic context, is used by Leonardo Bruni. In his *Isagogicon moralis discipline* (c. 1421–4), an introduction to moral philosophy, he discusses the nature of the supreme good.

He asks whether it consists in pleasure, as the Epicureans hold; in virtue alone, as the Stoics assume; or in virtue supplemented by bodily and material goods, as the school of Aristotle teaches. According to Bruni, the differences between these three positions lie only in words, not in matter; hence, all three positions could be reconciled (Bruni 1928; Griffiths et al. 1987).

A more radical approach is taken by the humanist Cosma Raimondi. Around the year 1429, he wrote a *Defense of Epicurus* (*Defensio Epicuri*) in the form of a letter to Ambrogio Tignosi, in which he describes the Epicurean notion of pleasure (*voluptas*) as the highest good and defends this position against the Academic, Stoic, and Peripatetic doctrines. He discusses in detail the pleasures of the individual senses and repeatedly points out that man consists not only of soul but also of body and soul (Davies 1987).

Pleasure as the Essential Criterion for Moral Action

The Epicurean notion of pleasure was also used to counter Stoic moral philosophy. Stoic-inspired moral doctrine, which based happiness on virtue alone and disregarded bodily pleasures, was more and more considered unrealistic and hypocritical. The mismatch between the rigid Stoic ideal, on the one hand, and the observation of actual human conduct, on the other, led to growing criticism of Stoic morality and a recognition of pleasure. This recognition was conducted through a reinterpretation of Epicurean philosophy.

One of the most famous Renaissance texts discussing the Epicurean notion of pleasure along these lines is Lorenzo Valla's dialogue in three parts *On Pleasure* (*De voluptate*, 1431), later renamed *On the True Good* (*De vero bono*) (Panizza 1978; Keßler 2004; Nauta 2017). The dialogue is centered around the question of the supreme good of man. The work first defends the Stoic position that the supreme good consists in the "honorable" (*honestum*) and thus in virtue alone. This position is attacked and refuted by

the second speaker of the dialogue, who praises instead the Epicurean notion of pleasure (*voluptas*) as the highest good. In the third part of the dialogue, the last speaker, being appointed to judge the presented positions, compares the Stoic and the Epicurean argumentations and renders a judgment in favor of the Epicurean. Afterwards, however, he shows that not even the Epicureans recognize the true good; this is accessible only to Christians, who can expect to enjoy pleasures even in the afterlife, which exceed many times the pleasures of this life. The sensual pleasures of the afterlife are presented as overwhelming and far more impressive than those experienced in this life. Every Christian has to measure and compare the pleasures of this life with those of the afterlife, "for we cannot have both" (Valla 1977, 266). In any case, there is no need to fear that Christianity brings with it a loss of pleasure (Valla 1977, 304). In this way, Valla not only rehabilitates the Epicurean notion of pleasure but also reinterprets Christian morality by devaluing Stoic elements and reconciling Epicurean pleasure with Christian doctrines (De Panizza Lorch 1985; Vickers 1986; Ebbersmeyer 2010, 222–255).

A similar approach can be found in various writings of Erasmus of Rotterdam, who was a great admirer of Valla's works. Like Valla, Erasmus makes use of Epicurean philosophy in order to refute rigid Stoic morality, and like Valla, Erasmus is concerned about reinterpreting Christian morality with the assistance of Epicurean philosophy. His work *The Praise of Folly* (1509) contains numerous Epicurean arguments, which are directed against Stoic morality (Panizza 1995). Additionally, we find references to the Epicurean concept of pleasure in some of the *Colloquia*, especially in *Epicureus* (1533) (Schmitz 2004, 141–153 and 164–195).

Epicurean morals based on the concept of pleasure also became the basis for a society model, most prominently in the writings of Thomas More, a friend of Erasmus. In his fictitious travel report *Utopia* (1516), he maps out a society characterized by a strict orientation

towards utility and collective pleasure (Surtz 1957). The Utopians “reckon that all our actions, and even all our virtues, terminate in pleasure, as in our chief end and greatest happiness; and they call every motion or state, either of body or mind, in which Nature teaches us to delight, a pleasure.” (More 1997, 49).

Impact and Legacy

Although Renaissance authors contributed to the rehabilitation of Epicurean pleasure, it still took some time before Epicurus and the notion of pleasure became fully accepted in Western philosophical thought. Francisco de Quevedo wrote a *Defense of Epicurus* (*Defensa da Epicuro*, 1635), in which he defends Epicurus’ notion of pleasure. He does so at the price of depicting Epicurus’ understanding of pleasure as being essentially Stoic: “Epicurus placed happiness (*felicidad*) in pleasure (*deleyte*), and pleasure in virtue, a doctrine so Stoic, that the absence of the name cannot hide it” (Quevedo 1635, 78v). The great promoter of Epicurean philosophy, Pierre Gassendi, took up the Epicurean notion of pleasure and re-interpreted it in Christian terms (Sarasohn 1996, 51–58). He even intended to write a book that “teaches Epicurus’ doctrine of pleasure by showing in what way the greatest good consists of pleasure and how the reward of human deed and virtues is based upon this principle” (Gassendi 1972, 72; [1964 3, 102]). Another promoter of Epicurean philosophy, Walter Charleton, found it still necessary to begin his work on *Epicurus’s Morals* (1656) with “An Apology for Epicurus,” although the charges against Epicurus’ morals do not include the concept of pleasure. However, the Epicurean assumption that pleasure is the fundamental criterion for human action found its way into the moral and political thought of such prominent philosophers as Hobbes (*Leviathan* I.6) or Spinoza (*Ethica* III proposition 28) and became thus a central feature of early modern philosophy.

Pléiade

Started: 1549, *Deffence et Illustration de la langue françoise*

Ended: 1585, Death of Ronsard

Anne-Pascale Pouey-Mounou
Université Charles-de-Gaulle – Lille 3,
Villeneuve d’Ascq Cedex, France

Abstract

We have come to call “Pléiade” a group of French poets of encyclopedic learning [Joachim du Bellay (*Deffence et illustration*,

1549), Pierre de Ronsard, Pontus de Tyard, Jean-Antoine de Baïf, Jacques Peletier du Mans, Rémi Belleau, Etienne Jodelle] who aimed to revitalize the classical arts and to argue for demanding poetry in the vernacular, both erudite and inspired. Their high-handed style contrasted with that of their predecessors (the *Grands Rhétoriciens* and Marotic poets), and their poetic production was varied.

The Pléiade had an important lexical and poetic impact. Its principles were inseparably literary and philosophical, due to a humanist trust in language’s capacity to reveal the hidden qualities of things as well as in the signifying power of classical, allegorical myth (cf. Jean Dorat’s teachings). They attracted criticism because of their erudition, but also because of Reformist rejection of pagan myth and “useless” profane poetry.

The Pléiade poets embraced philosophy and the sciences, especially mathematics, cosmology and meteorology, astrology, music, bestiaries, and lapidaries. They played a pivotal role in two Academies and some contemporaneous philosophical dialogues featured them in poetry or natural philosophy. As regards the philosophy of love, they explored the philosophical and literary innovations arriving from Italy (Neoplatonism, Petrarchism), at least temporarily; these influences were, however, enmeshed with the dominant Aristotelianism.

The influence of the Pléiade was so powerful that Ronsard came to represent negatively the Renaissance legacy for the following century. It also extended to other vernacular languages in Europe.

Introduction

Although Ronsard himself used the term “Pléiade” (*Elegie à Chr. de Choiseul*, 1556), the group of poets we have come to identify with this name was not an official entity nor a school. Moreover, as Ronsard’s various lists suggest (*Bacchanales*, 1552, *Isles Fortunées*, 1553, etc.), its membership fluctuated, as did its name, the more combative term of “Brigade” sometimes

being preferred to this metaphor drawn from the seven-starred constellation in which the great Alexandrian poets were supposedly reincarnated. Broadly, though, “the Pléiade” in the sixteenth century referred to a group of French poets which formed under Henry II (1547–1559), centered around du Bellay and Ronsard, whose overt aim was to break new aesthetic ground. The group is taken to include, additionally, Pontus de Tyard, Jean-Antoine de Baïf, Jacques Peletier du Mans, Rémi Belleau, and Etienne Jodelle; but many friends and imitators were also associated with it.

These young Paris-based poets were united by a whole series of shared experiences Chamard (1939–1963): they studied under the inspiring figure of the Hellenist Jean Dorat, who had been Baïf’s and Ronsard tutor, and then at the Coqueret and Boncourt Colleges (Simonin 1990); Peletier du Mans and others such as Marc-Antoine Muret facilitated their contact, and Pontus de Tyard provided the link between the poetic worlds of Lyon and Paris. Ronsard rallied everyone around him and was the group’s leader, while Du Bellay’s *Deffence et Illustration de la langue françoise* (1549) provided it with a sort of Manifesto.

The Pléiade’s poetic production was varied, ranging from minor classical genres to the “noble” genres of the ode and the epic. It included theater (Baïf and Jodelle), treatises on poetics and on science, and philosophical dialogues in prose (Peletier and Tyard). The life paths of the individuals involved were equally diverse. Ronsard was spectacularly successful: he was protected by the Guise and Odet de Coligny (cardinal of Chastillon) and was appointed as the king’s ordinary chaplain (1559), consorting with the great (from Marie Stuart to the royal family) to the extent of earning the epithet of “prince of poets.” Du Bellay, despite being born into one of the most prestigious families in France and serving as secretary to the Cardinal Jean du Bellay, became disenchanted with his post in distant Rome, as expressed in *Les Regrets* (1558). Then there was Jodelle, whose later life was embittered by a fall from grace. The high-handed style of these aristocratic poets contrasted starkly with that of their immediate predecessors (the *Grands Rhétoriciens* and Marotic poets), even though

most of them (except Pontus de Tyard) still depended on patrons for protection and ecclesiastical office. Ronsard and others never missed an opportunity to remind their benefactors of the fame and immortality it was theirs to bestow.

The Pléiade poets were humanists of encyclopedic learning. While embracing both philosophy and the sciences, especially mathematics – practiced by Peletier and Tyard to a high standard – they were versed in the allegorical interpretation of classical myth, thanks to Dorat’s teachings (Dorat 2000), and eager to explore the philosophical and literary innovations arriving from Italy, such as Neoplatonism and Petrarchism. Their poetic aim was to revitalize the classical arts and learning and to argue for demanding poetry in the vernacular, both erudite and inspired.

The Classical Heritage and the Break with Tradition

These were the ambitions expressed in Du Bellay’s *Deffence et Illustration de la langue françoise* (1549). In the wake of the Edict of Villers-Cotterêts (1539), by which French became the official administrative language of the kingdom, the *Deffence* championed national literature in the vernacular capable of rivaling its classical predecessors. It claimed that French was adequate in all knowledge areas, just like Greek and Latin. In opposition to the neo-Latin authors, who despised the vernacular as too impoverished, Du Bellay’s work spelt out how the French language should be *defended* and made *illustrious*.

Du Bellay was not the first advocate of the merits of the vernacular compared to Latin. His work was preceded by Thomas Sébillet’s *Art poétique françois* (1548, Goyet 1990) and the *Dialogo delle lingue* (1542) written by Sperone Speroni in the context of the *questione della lingua*, which emerged out of Ciceronianism and Bemboism in Italy, in which Speroni argued against Bembo’s precepts of linguistic purism (Speroni 1978). However, the *Deffence et Illustration* had the particularity of giving a coherent and provocative vision of language and literature, on which most of the early Pléiade’s experimentation was

based. Unlike Sébillet, whose examples were drawn from early sixteenth-century French poetry, Du Bellay rejected the previous generation (the *Grand Rhétoriqueurs* and the Marotic poets) and criticized their obsession with form, their practice of translation, and implicitly their courtly focus. The desire to break with the past was motivated not only by generational conflict but also by a certain aristocratic arrogance which was quick to be condemned in an anonymous counterattack, *Quintil Horatian* (1550), attributed to Barthélémy Aneau (Goyet 1990).

The *Deffence*'s yardstick was antiquity and the proposed "defense" of the French language had the theory of imitation at its core. One should imitate the ancients, but in conformity with the unique character of one's own language. This idea that each language has a specific "property" can be understood in the context of the contemporary controversies about translating "for sense" or "word for word." Translation, Du Bellay argued, should give way to imitation and personal assimilation of sources ("*innutrition*"), which fosters creative invention. Formally speaking, Du Bellay advocated redeploying classical poetic forms and the Petrarchan sonnet; among the stylistic ornaments he recommended, there were tropes such as periphrasis, comparison, metaphor, and hyperbole. He advocated combining inspiration (*furor*) with the more technical "*labor*" of the poet, whose aim was to move the reader. Above all, for the French to become "illustrious," as intended, it must be enriched: it was still feeble, but full of unexplored potential and promise, which should be identified and cultivated, in line with a certain idea of nature and the corresponding ideal of abundance (*copia*), as theorized in the Renaissance. "Nature" remained mostly inscrutable, except as a sign of the Creator's infinite inventiveness, and was no less compatible with a Plinian or Augustinian ideal as with the Aristotelian concepts of potentiality and actuality. In order to achieve this enrichment lexically, Du Bellay advocated the use of archaisms and dialectical expressions, technical terms and neologisms, particularly compounds and derivational affixes on the basis of existing roots ("*provignement*"), Grecisms and latinisms, and the nominalization of

infinitives and adjectives. It was this neologistic activity which would characterize the Pléiade for the ensuing generations, as much as its scholarly aspirations or inspired tone. With the advent of seventeenth-century classicism, Pléiade poetry, which had been so extensively imitated throughout the second half of the sixteenth century, became discredited and, after Malherbe's assault, was dealt a death blow by Boileau's condemnation of Ronsard's conceited ambitions, his stylistic "disorder," and the fact that his poetry "in French [speaks] Greek and Latin" (*Art poétique*, I, 1674). It was not until Sainte-Beuve, as representative of Romanticism and its particular agenda, that the Pléiade partially found favor again.

Original and Innovative Aspects

The Pléiade had an important and lasting influence, beyond its brash claims. Its impact on the French language was not only lexical, but also orthographic, the grammatical structure of words, and syntax. The Pléiade poets took an interest in spelling reform (cf. Louis Meigret, 1550), and they gave explanations of their choices of spelling and agreement in order to further linguistic standardization. Peletier du Mans wrote a *Dialogue de l'Ortografie e Prononciation Françoisese* (1555), which was not taken up, and proposed spellings which he used in his own works.

The Pléiade made a significant contribution to the French vocabulary. Although its detractors focused on the neologisms which were finally not adopted, many words, whose novelty we no longer notice, were naturalized into French. Such successful transplants were a tribute to the Pléiade's attention to the development of the language, which was far greater than Classicism gave it credit for. Ronsard stands as the prime example of an emergent authorial awareness in the Renaissance precisely in the care he took to assemble his writings into a *Complete Works*, a "monument" he constantly revised (from 1560 to 1584, not to mention the posthumous edition of 1587), and above all in his responsiveness to changes in the language, suggested by a whole series of

corrections of detail he made. This was his way of aspiring to immortality. Moreover, the Pléiade's linguistic principles were inseparably literary and philosophical: the Pléiade poets were criticized for their excesses, but they were actually seeking to fashion a total poetics, through their meticulous attention to language, including current usage. This poetics was informed by a certain idea of language's dynamic signifying movement and its capacity to reveal the hidden qualities of things through hitherto unsuspected interrelations produced by wordplay. The defense of the French language was thus inseparable from a new poetics which aspired to reveal the latent potential of words and of the world and to actualize things through words, as expressed in the idea of "perfection" (based on Aristotle's articulation of potentiality and actuality) (Pouey-Mounou 2002). Despite its apparent diversity, the Pléiade's vision was thus extremely coherent, combining lexical and stylistic innovation with poetic and political goals, a new status for the inspired poet, a revitalization of learning, and theories of language and the world.

For example, the value placed on diversity was based on an idea of natural diversity, which poetry was to imitate. Ronsard in particular adhered to this principle (Castor 1964) and wrote in a wide range of genres, which are highlighted by the architecture of his *Complete Works*: in the "monumental" 1584 edition, the books of *Amours* (to which Ronsard's work has often been reduced) come first, then the other sonnets, bawdy verse (the *Gayetez*, partly derived from the *Folastries* of 1553), *La Charite*, the *Odes*, the unfinished epic *La Franciade* (1572), *Le Bocage royal* which reworks and perfects previous attempts at a mixed-genre volume (*Bocage* and *Meslanges*), the eclogues, masquerades, *Combats* and *Cartels*, the *Elegies*, the *Hynnes*, the *Poemes*, the *Epitaphes*, and lastly the *Discours*. Ronsard was always experimenting, from his first *Odes* (1550), which found favor with scholarly circles (but not with the Court), to his first book of *Amours* (1552), which earned him notoriety, through to the maturer love expressed in the *Sonnets pour Helene* (1578) and the funeral sonnets of the *Derniers Vers* (1585). He used classical literary

genres (the ode, elegy, epigram, epistle, eclogue, epithalamium, epitaph, and epic) and the genre of the sonnet; but he also wrote pieces of court entertainment and bawdy and learned verse *Folastries* (1553), the cosmological and mythological *Hymnes* (1556–1557), as well as political writings, the *Discours des Miseres de ce temps*, in which he defended the Catholic royalist cause in the first War of Religion (1562–1563). The inventiveness of his *Odes* (Laumonier 1909), which combine both Pindaric and Horatian models, and particularly the inspired and digressive development, and the extremely complex metrical and stanzaic patterns of the Pindaric odes, amply illustrate his aesthetics of diversity, which aimed at "resembling nature" (Preface to the *Odes*, 1550). This ideal of diversity was later embodied more systematically in the books of *Amours*, which Ronsard worked on throughout his life. Changing the order of his poems and their distribution between the different volumes, and changing the name of his muse, as though better to advertise a new stylistic departure, Ronsard thus broadcasted his right to stylistico-amorous renewal: the *Amours* proceeds from the inspired and platonizing Petrarchism of the first book (1552), which became *Amours de Cassandre* in 1560; moves on to the "low" style of the *Continuations* (1555–1556), which in 1560 became the *Amours de Marie*; and then chooses a quieter, platonizing vein for the *Sonnets pour Hélène* (1578). Ronsard laid claim to absolute poetic freedom and defended diversity as the epitome of his poetic art. To this end, he often destroyed the image he had built up in preceding poems, perhaps also out of irritation with his imitators. Another way in which this freedom is expressed is in the mixed genre compositions, which are placed in different parts of the *Complete Works* depending on the edition and which espouse the aesthetics of the *silva*. And although Ronsard soon distinguished himself within the Pléiade for his "noble" genres (the ode and the epic) and learned poetry (the *Hymnes*), the *Folastries* (1553), published anonymously but immediately attributed to Ronsard, was a field of experimentation in a lighter, neo-Catullan vein, with richly inventive lexical, generic, and metrical choices, mixing *odelettes*,

epigrams, and Bacchic *Dithyrambes* in free verse containing impressive series of Greco-Latin epithets and exuberant flourishes of poetic “*furor*,” as well as two blasons of the male and female genitalia in sonnet form.

This experimental aspect is a general feature of the Pléiade. Although not all the poets of the group were equally wide-ranging, their work taken as a whole gives a very varied picture and is certainly not restricted to love poetry. One need only mention Belleau’s Anacreontic odes (1556), blasons (*Petites Inventions*, 1554–1556, *Les Amours et Nouveaux Eschanges des pierres précieuses*, 1576), and *Bergerie* (1565–1572); Baïf’s lists of proverbs in the genre of the *coq-à-l’âne* (*Mimes, Enseignemens et Proverbes*, 1576–1597); Jodelle’s classicizing tragedies (*Cléopâtre captive*, 1553, *Didon se sacrifiant*, [1557?]) and comedies (Baïf, *Le Brave*, 1567); Pontus de Tyard’s philosophical dialogues (1552–1558), and the treatises and learned poetry of Peletier du Mans; and lastly the Roman works of Du Bellay (1553–1558), including the lyrical and satirical sonnets of the *Regrets*, the *Divers Jeux rustiques*, and the *Poemata*, written in Latin despite the *Deffence*.

As regards poetic technique, the Pléiade innovated around the line and the stanza. Ronsard deserves a special mention here. In naturalizing the Pindaric ode into the French language, he introduced its stanzaic and metrical flexibility, including enjambements, its digressions and obscure mythological periphrases running over several lines, and even the structure of triadic series which he explored in his experimental Pindaric ode, *A Michel de L’Hospital* (1552). He additionally worked on short forms such as the Horatian ode, the *odelette*, and the epigram, as well as longer forms inherited from classical literature. His books of *Amours* enriched the sonnet form in France, made it more regular, and brought about its gradual transformation from decasyllables to alexandrines. He was still preoccupied with the issue of the comparative merits of these types of verses in *La Franciade* (1572) and explained in his *Preface* why, after all, he used decasyllables in this poem. The Pléiade was also a key protagonist in the controversies arising out of

Ciceronianism and Bembism and influenced by Ramism, concerning the capacity of a vernacular language without prosodic features, such as French, to be a match for Latin cadences (Meerhoff 1986). The Pléiade frequently considered rhyme to be an inadequate remedy for this defect of the French language, especially as it had been the focus of the previous generation’s poetic production. Through its work on “significant” rhymes (Du Bellay), as well as on rhythm (Du Bellay’s *Deffence* had explored the interconnection between the two), on sound (Peletier), homeoteleuta, tropes, and all sorts of experimental cadences, not forgetting Baïf’s metrical patterns “*mesurés à la lyre*,” the Pléiade thoroughly explored the potential of the French language. Certain forms became more regular, and the French ear was gradually trained to accept certain patterns of rhyme, rhythm, and sound, particularly through intensive work on the sonnet form, and countless usages, which we no longer notice, were systematized.

Unlike the Pléiade’s more provocative features, which took center stage, these innovations required subtlety. Ronsard in particular, but more generally all the Pléiade, was playing a double game, pandering to the tastes of the Court while actually aiming at fashioning their public’s taste. In the first book of the *Amours* (1552), for example, the contemporary fashion for love sonnets was the vehicle for an ambitious, mythological, and prophetic type of poetry, which the Court had spurned in the earlier *Odes* (1550). The second edition, in 1553, contained a commentary by Marc-Antoine Muret designed to elucidate its more obscure aspects and thus win over the public, and also musical settings, so that the sonnets could be sung in the order of their rhyme schemes. The series of corrections which Ronsard made to the *Odes* and *Amours* in his *Complete Works* (Terreaux 1968) bear out this negotiation with a public’s evolving tastes, which must be both flattered and transformed. These ambitious new goals, and the Pléiade’s real contribution to the French vocabulary and French poetic forms, explain the publication in the second half of the sixteenth century of anthologies (Gilles Corrozet, *Le Parnasse des poètes françois modernes*, 1571) and dictionaries of rhetorical technique

(La Porte's *Epithetes*, 1571, 2009) in which this poetry was championed as a model for poetic composition in French, just as Homer and Virgil had been models for Greco-Latin literature. The collaboration of Pléiade poets, already in 1555, on the translation into French of the Latin verse quotations in Ramus's *La Dialectique* was a true sign of their consecration and also, of course, of the effectiveness of their self-promotion (Ramus 1996).

Their growing acclaim was also amplified by the dynamics within the group, which took the form of joint ventures or, conversely, of individual members marking out their particular territory. Joint ventures included Baïf's bawdy verse (the second book of *Amours de Meline*, 1552), Ronsard's *Folastries* (1553), Magny's *Gayetez* (1554), Tahureau's *Mignardises* (1554), and Vauquelin de La Fresnaye's *Foresteries* (1555). One should also mention the Bacchic festivities crowning the success of Jodelle's *Cléopâtre captive* in 1553, which incorporated Baïf's and Ronsard's free-verse *Dithyrambes*, published in *Poèmes* and *Folastries* respectively, and also featured a ram adorned for sacrifice on the altar of Bacchus, which was still controversial a decade later, reemerging in the Protestant polemic sparked by the *Discours des Miseres de ce temps* (1562–1563, Pineaux 1973). As for relations between the Pléiade members, there was the exchange of blazons between Belleau and Ronsard and Du Bellay and Ronsard's well-known rivalry, which was one of the reasons for Du Bellay's emphasis on the supposedly "simple" style of his *Regrets* in opposition to Ronsard's learned and inspired poetry. More generally, these relations shaped the Pléiade poets' and their imitators' self-promotional strategies, under the acknowledged leadership of Ronsard. The "Brigade" claimed a new status for the poet, on the basis of the *Deffence*'s theory of imitation; the provocative gestures with which it often accompanied its inventive reworkings; the foregrounding of inspired "*furor*," giving a flattering image of the poet; and Ronsard's decision to create a poetic "monument," as well as his assertion in the *Discours* that the poet should carry a certain weight in public affairs. These were

precisely the ambitions of the poet – considered inflated – for which Ronsard would later be criticized.

Interconnections

Another characteristic of Pléiade poetry was its self-conscious erudition, for which it was also criticized. Its scholarly and recondite references to classical mythology, for example, embodied both an elitist address to the learned, who were indeed the first to recognize the young Ronsard's talent, in the *Odes*, and a fascination with the suggestive potential of little-known myths, often inspired by contemporary annotated editions and influenced by Dorat's allegorical approach in his teachings (Dorat 2000). These references also reflected a humanist trust in the signifying power of "the fable" (myth), understood as the locus of the secrets glimpsed by the ancients. The corresponding aesthetic, with its valorization of periphrasis, erudite epithets, and metaphor, favored circuitous indirection attuned to the fleeting revelation of the hidden mysteries of nature. It understandably had a certain prestige, linked to the aura surrounding antiquity and to the figure of the inspired poet-prophet (*vates*), at once an initiate and a discoverer, whose oracular style expressed his privileged status among men. However, not all the Pléiade poets were as erudite in their use of mythology. While Ronsard's later work was a little more straightforward, he was initially the most obscure, especially in the *Odes* and the first book of the *Amours*, in which his muse Cassandra is named after the Trojan prophetess with whom Apollo, the god of inspired prophecy, fell in love, but also after a particularly obscure version of the same myth, Lycophron's *Alexandra*, which Dorat had taught. Overall, however, the Pléiade poets unapologetically drew on pagan and classical themes in abundance.

This attracted criticism on two fronts. The first emerged with the publication of the *Odes* and resurfaced in the seventeenth century, as the aesthetics of clarity took hold. It targeted the obscure, learned references that Muret's 1553 critical edition of the *Amours* had sought to elucidate.

However, even if Ronsard later aimed for greater transparency, after the exuberance of the *Odes* and the first book of the *Amours*, he remained unrepentant, since his poetic program was inseparable from this work on vocabulary and the use of tropes and erudite allusions: the aesthetics of “illustration” implied exploring the world through language and using the unexpected interconnections between words to reveal the nature of things. The Pléiade also espoused the humanist ideal of the richly suggestive layers of meaning latent in the “fable”: this was embodied in Ronsard’s image (*Hymne de l’Autonne*, 1563) of the shimmering “*fabuleux manteau*” – a version of the *integumentum* – which both veil and reveal the mysteries glimpsed by the inspired poet. This approach to myth is derived from the notion of *prisca theologia*, the “first theology” considered to be present in pagan myth before the Christian Revelation, which justified the Neoplatonist and humanist return to Antiquity. Ronsard alluded to this in his *Hymne de l’Hercule Chrestien* (1555), one of his few overtly Christian pieces, in which he christianized the myth of Hercules, and again at the end of the controversy around his *Discours* (*Responce aux injures*, 1563), when he poured scorn on the criticisms of his Protestant adversaries. Such attacks relate to the second type of criticism leveled against Ronsard’s poetry, this time by Reform poets who rejected pagan myth (in favor of Biblical myth) and condemned the spiritual “uselessness” of profane poetry. This was what caused the rift between the Pléiade and the newly converted Théodore de Bèze after 1550, when, in the Preface to his *Abraham sacrificant*, he criticized the Pléiade’s use of pagan myth and their emphasis on love (Smith MC 1995). The differences in these issues were irreconcilable.

The affair of the ram (sacrificed or not) in the *Dithyrambes* of 1553 resurfaced for the same reasons in the polemic generated by the *Discours*, namely, its explicit paganism which seemed to call into question Ronsard’s Catholic commitment (Pineaux 1973). In their politico-religious leanings, the Pléiade poets were in the Catholic camp and sometimes expressed this through satirical pieces (Jodelle), or more substantial forms, but over a limited period, such as Ronsard’s *Discours*

des Miseres de ce temps (1562–1563). The claim to political status for the poet is what makes the *Discours* particularly striking, to the extent that some critics have labeled it – wrongly, and somewhat anachronistically – as the first example of “committed” literature in the French language. Be that as it may, the positions adopted are derived as much from a certain idea of the person of the king, the kingdom (Ménager 1979), and the place of man in the world as from properly religious convictions; they conveyed a world view, in which religion occupied a particular place. This global vision explains the coherence of the different elements comprising Ronsard’s poetics, both the politico-religious choices and the humanist inspiration. It also explains the fact that at the end of the first War of Religion and the polemic sparked by Ronsard’s *Discours*, it was one of the most brilliant defenses of his poetics, the *Responce aux injures* (1563), which could put an end to the debate.

The Pléiade was also interested in natural philosophy (Schmidt 1938). Peletier du Mans and Pontus de Tyard in particular were drawn to scientific ideas, as expressed in their treatises and dialogues as well as in their love poetry. Peletier, for example, who was known for his contribution to mathematics, wrote treatises on arithmetic, algebra, and geometry and his *L’Amour des Amours* (1555) draws on astronomy. Tyard’s Petrarchist and Platonizing vision of love guides at once his translation of Judah Abravanel (Leone Ebreo, 1551) and his philosophical writings (1552–1558). The scientific frames of reference were of their time – a vulgarized Aristotelianism blended with Neoplatonism and other classical theories – but many of the writings and debates associated with these figures at the time prove that they were also familiar with Copernicus’s *De Revolutionibus* (1543). Less consistently, the poets showed an interest in meteorology, such as Baïf’s *Les Météores* (1567) and Ronsard in many poems and metaphors. Belleau’s blazons show another facet of this scientific focus: his sources are Pliny, Albertus Magnus, the major bestiaries and lapidaries, and various contemporary encyclopedias. As for Ronsard, his *Hymnes* (1555–1556) and many aspects of his work

express a world view which, within the cosmological frameworks of his time, borrows eclectically from atomism, Empedocles (order and disorder), and Neoplatonism. The image which emerges is one of a coherent universe dominated by the tension between order and disorder (*concordia discors*), by the transmutation of elements into each other, and by a movement oriented toward the revelation of the concealed potential of the world, which is the task of poetry (Pouey-Mounou 2002). His *Hymne de la Philosophie* (1555) and several exordia to the hymns of the *III Saisons de l'an* (1563) illustrate his encyclopedic conception of poetry; according to which, by sifting through all knowledge, the poet may reconstitute for mankind fragments of divine mysteries which take the veiled form of myth.

The Pléiade's encyclopedic concerns are also evident in their pivotal role in two Academies (Yates 1988). The *Académie de Poésie et de Musique* presided by Baïf with Thibault de Courville (under Charles IX, 1570) worked with musicians to experiment with "quantitative verse [*vers mesurés*] set to music." Music was considered to have an encyclopedic value – capable of including all the arts and sciences – and philosophical, social, moral, and mystical "effects." In the second of these Academies, the *Académie du Palais*, Henry III invited Ronsard, Baïf, and Tyard, among others, to his private apartments in the Louvre to discuss problems of morals and natural philosophy in his presence. The attention given to these sorts of issues was already evident in Tyard's two *Solitaires* (1552 and 1555), which contained a theory of inspiration and a theory of music, respectively. Tyard's other philosophical writings, such as *L'Univers* (1557) or *Mantice* (1558), engaged with contemporary scientific debates. Other philosophical dialogues featured Pléiade poets on poetry or natural philosophy: Louis Le Caron's *Dialogue IV* ("Ronsard, ou de la Poésie," 1556) (Le Caron 1986) had Ronsard and Jodelle debating the relations between poetry and philosophy, the influence of Plato, the sociopolitical role of poetry, and the different aspects of poetic creation. Guy de Bruès's *Dialogues* (1557, Bruès 1953) set a dogmatic Ronsard against a

relativist Baïf on questions of natural philosophy, in relation, among other things, to Copernicus's model. These dialogues are fictional, but they reflect the freedom of tone and the keen involvement in contemporary philosophical debate, which can be found in some of these authors' poems: thus, one of Ronsard's corrections to his sonnets alludes to a debate opposing contemporary readings of Cicero and Aristotle around the question of *endelechy* or *entelechy*. The *Douze fables de fleuves ou fontaines* (1586) which, according to its publisher Tabourot, Baïf composed to decorate the Château of Anet, is one of the many examples of collaboration between the arts, which were all to be united within encyclopedic learning. It is significant in this respect that the logician, mathematician, and rhetorician Petrus Ramus took such a close interest in the Pléiade's debates.

Lastly, as regards the philosophy of love, the Pléiade was initially influenced by Petrarchist and Platonizing trends. These were introduced by Tyard (*Erreurs amoureuses*, 1549) and redeployed by Du Bellay (*L'Olive*, 1549), Ronsard (First Book of *Amours*, 1552), and Peletier (*L'Amour des Amours*, 1555). The development of Ronsard's *Amours*, with the "low" style of the *Amours de Marie* in counterpoint to the First Book, and then the *Sonnets pour Helene* which alludes to the Platonizing culture of his muse, but in a less pronounced way, correspond partly to an aesthetic of *variatio*. This aesthetic is also a hallmark of Baïf's poetry, in the range of subjects from which he drew his inspiration, and the formal diversity of the two books of the *Amours de Meline* (1552) and the *Amours de Francine* (1555). But it was also part of a more general development in which certain Pléiade poets began to reject Petrarchism, at least temporarily. Du Bellay, for instance, criticized Petrarchizing clichés (in his elegy "A une Dame," 1553, rebaptized "Contre les pétrarquistes," 1558), as did Ronsard in the opening text of the *Amours de Marie* ("Elegie à son Livre," 1567). Tyard, by contrast, remained exceptionally faithful to Petrarchist and Platonizing influences throughout his work. Neoplatonic influences were, moreover, enmeshed with the dominant Aristotelianism,

which was itself hospitable to new developments from Italy (Petrarchism and Neoplatonism), as well as, occasionally, to other systems of thought.

Impact and Legacy

The influence of the Pléiade in the second half of the sixteenth century was so powerful that Ronsard, along with the Protestant poet Guillaume de Salluste Du Bartas, came to represent negatively the Renaissance legacy for the following century. Although this image is something of a caricature, the idea of language and the relation to the world embodied in Pléiade poetry is indeed typical of this period and was influential well beyond it, despite the disrepute into which the Pléiade fell in France from the seventeenth century onwards. The Pléiade's influence also extended beyond the borders of France through the defense and illustration of other vernacular languages in Europe and through foreign translations and imitations by poets, theorists, lexicographers, and members of foreign Academies.

The Pléiade's significance certainly went further than the group of seven poets one usually associates with the name. There was a whole nebulous of individuals – poets, playwrights, prose writers, artists, historians, moralists, lexicographers, and printers – “adopted” by and loosely attached to this core group. The Pléiade was thus associated with a significant proportion of the artistic production of the second half of the sixteenth century in France (Raymond 1927): with the theater of La Pérouse, Garnier and Grevin, Des Autels's poetry, and the paintings of Nicolas Denisot du Mans, called by his anagram “le conte d'Alsinois.” Among the different groups, and generations of imitators, some are distinguished by age, for example, the youngest group comprising Magny, Tahureau, Vauquelin de La Fresnaye, and Scévole de Sainte-Marthe. Philippe Desportes deserves a special mention, because he in certain respects eclipsed Ronsard's fame in the latter's declining years. One should also remember that certain major sixteenth-century poets, such as Du Bartas and Agrippa d'Aubigné, were not associated with the Pléiade, although they admired Ronsard and to

an extent were influenced by him – for example, Agrippa d'Aubigné's *Printemps* or Du Bartas in his cosmological themes, his notion of enthusiasm, and his use of learned epithets. After Ronsard's death, some of those who inherited the Pléiade's serious and profane vein distanced themselves from its linguistic model and produced a more polished, courtly style (Bertaut, Du Perron). Du Monin, by contrast, typified a philosophical approach which reproduced all the Pléiade's excesses, while Du Bartas embodied a Christian approach different from that of the Pléiade, but shaped by the latter's cosmological ambitions and linguistic enrichment. As regards love poetry, Petrarchist poetry was influenced by the italianizing style of Desportes – with his inflamed lyricism, his aesthetics of the “*pointe*,” and his taste for verbal artifice – and, in a less noble vein, “Catullian” poets, exemplified the general “disintegration of the aesthetic ideal of 1550” (Raymond 1927), despite the existence of a few faithful followers.

The Pléiade's influence persisted in seventeenth-century France among neo-Petrarchist followers of Desportes, in pastoral poetry, and also in a “black,” anguished neo-Petrarchism, of almost baroque sensibility, of poets such as Nuysement and Motin (Jarrety et al. 1997). To a lesser extent, its poetics informs licentious libertine writings, which drew copiously on Ronsard's *Folastries* and Du Bellay's *Divers Jeux rustiques*. Yet, as Classicism took hold, with its ideal of clarity and rationality, its linguistic purism, and grammaticalization, most of the salient features of Pléiade poetry came to be condemned, and Ronsard was paraded as a linguistic counterexample. Criticism was leveled primarily at the mythological and pagan themes, the neologisms – particularly compound adjectives – dialectal usage, archaisms, grecisms, and latinisms; the technical, prosaic and “base” terms, nominalizations, and inversions; and every form of poetic license, erudition and scientific and specialized language, as well as the figure of the inspired poet, which was abundantly caricatured. All these Pléiade features came to define the pedantic pedagogue pursuing Court favor in his affected language. The Pléiade style had additionally become less striking and more stereotyped

due to increasingly mediocre imitations and the appearance of various glossaries, manuals, and commonplace books. More fundamentally, the rejection of this legacy was a rejection of modes of thought: the poetic choices reflected social divisions, between the Latin sphere of the Colleges and the world of the salons and the Court; a changing relation to the past, most spectacularly illustrated by the *Querelle des Anciens et des Modernes*; a strongly normative and dogmatic world view, whose moral order, as imposed by Richelieu, was also a reaction to the recent past of religious conflict and of scientific and libertine challenges. These choices also expressed a relation to language, which could almost be called ontological: what counted henceforth was conceptual clarity, syntactical coherence, the ideal of a perfect fit between language and thought, and the value of appropriateness, increasingly interpreted as *bienséance*. First Malherbe, then Boileau, consigned the Pléiade to oblivion, while at the same time, they were heavily indebted to the enriched lexis and the systems of versification and rhyme the Pléiade had developed.

The Pléiade's influence in Europe was linked to the struggle for vernacular languages and also, historically, to a large number of French Protestant émigrés in the countries of Northern Europe. In the Netherlands, for example, poets, theoreticians, and lexicographers imitated Ronsard, Du Bellay, and Du Bartas (Smith PJ 2010). The context of Anthoni Smyters's translation of de La Porte's *Epithetes* (1571) in 1620 was that of claims for the use of the vernacular in Dutch poetry among Flemish refugees and particularly around Karel van Mander, a painter, and literary mentor, and around the literary society *De Witte Angieren* ("the White Carnations") in Haarlem. The Dutch poet Jan van der Noot, who modeled his work on Du Bellay, Ronsard, Marot, and Du Bartas, and introduced the alexandrine into Dutch poetry, helped bring the Pléiade to England and Germany, during the spells of exile which his changing religious affiliations brought upon him. Spenser, and most of the great English poets of the time, reflect this influence. Martin Opitz in Germany, whose treatise on poetics (1624) owed much to the Pléiade, had a unifying role which

was crucial for German poetry. A member of the Fruitbearing Society (*Fruchtbringende Gesellschaft*), and in contact with the Italian *Crusca*, his literary choices illustrate the highly paradoxical nature of this legacy: his recasting of the Platonic theory of enthusiasm; his preoccupation with technique (genres, versification, and rhetorical devices); his praise of the vernacular, which he sought to unify while rejecting dialectal usage; his advocacy of compound neologisms to which Germanic languages are so conducive; and the new metrical patterns he introduced in order to simplify, but also standardize, versification – all these changes led the Pléiade's influence, as transmitted by Opitz, to be interpreted in Germany as a new form of academicism, in the footsteps of Luther, just when French Classicism was rejecting this tradition for the opposite reasons. When he came into contact with French literary circles during his stay in Paris (1630), Opitz was thus both disconcerted and disappointed (Opitz 2009).

So, as we have seen, the relation to language depended on the specific context of reception. The linguistic unification sought by Opitz and both the German (*Fruchtbringende Gesellschaft*) and Italian (*Crusca*) Academies was intolerant of dialecticisms, whereas French, which was more solidly structured as a national language, had less to fear from these at the time of the Pléiade. Ideological and religious factors were also crucial: the Protestant convictions of the Pléiade's Dutch and German imitators made them suspicious of its paganism, despite Du Bartas's successful reworking of the topics of enthusiasm. Such curious inverted trajectories, by which outside France the Pléiade's contribution was understood in terms of linguistic standardization and academicism, in such stark contrast to the terms of its reception (and rejection) by French Classicism, illustrate just two aspects of a complex influence, from which each literary history has retained only what suited it.

Poinsot, John

Born: Lisbon, 9 July 1589

Died: Fraga, Spain, 17 June 1644

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

John of St. Thomas, O.P. (Poinsot), was a Portuguese Dominican who was one of the most significant Thomists of his order during the seventeenth century. Born in Lisbon in 1589 as John Poinsot, he would take the name “John of St. Thomas” upon his admission to the Order of Preachers in 1610. Before joining the religious life, Poinsot studied arts at the University of Coimbra where Jesuit learning and education were in full force. From Coimbra, Poinsot followed his father, liege to the Archduke Albert of Austria, to Flanders. There Poinsot enrolled in the University of Louvain where he studied theology. John of St. Thomas

Aquinas's life was spent teaching in the various houses of studies that the Dominicans oversaw, but perhaps his most significant appointment was to the University of Alcalá where he held the cátedra de vísperas and then the cátedra de prima. During his time at Alcalá, John of St. Thomas authored the two texts for which he is most famous: the *Cursus philosophicus thomisticus* and *Cursus theologicus*. John of St. Thomas was forced to leave his academic life behind when he was chosen to be the confessor of King Philip IV. The Dominican died in his king's service at Fraga in 1644.

Biography

John Poinsot (John of St. Thomas), O.P. (Lisbon, 9 July 1589–Fraga, Spain, 17 June 1644), after his brother Louis Poinsot (d. 1655), was the second son of Peter Poinsot, secretary to the Archduke Albert of Austria, and Maria Garcez. In addition to figures such as Johannes Capreolus (ca. 1380–1444) and Tommaso de Vio Cajetan (1469–1534), Poinsot ranks as one of the most outstanding proponents of Thomism not only during the golden age of Spain's second scholasticism but for all time. In a deathbed pronouncement, Poinsot exclaimed that in the last 30 years of his life – his entire scholarly career – he had never written nor taught anything that was discordant with the truth or with the thought of the Angelic Doctor (*CT*, xii, n. 39).

Poinsot's academic life began in Coimbra where he, together with his brother Louis, enrolled in the university that had become one of the leading centers of education on the Iberian Peninsula. Associated with the Society of Jesus, Coimbra was home to some of the towering Jesuit intellectuals including the Conimbricenses, who produced several volumes of Aristotelian commentaries, Pedro da Fonseca (1528–1599) – also known as the “Portuguese Aristotle” – Luis de Molina (1535–1600), and Francisco Suárez (1548–1617). Concerning this last figure, though Coimbra was Suárez's home between 1597 and 1615, it is not likely that the youthful Poinsot had the occasion to study under the Jesuit since during

Poinsot's stay Suárez was embroiled in a controversy concerning the validity of epistolary confession between 1602 and 1604, which ultimately necessitated Suárez's travel to Rome to render an account of his (condemned) position to the Holy See. Poinsot in the meantime was in the midst of his arts studies and was awarded a bachelor of arts in 1605. Though Poinsot did not study immediately under Suárez, the latter would nevertheless exercise a considerable degree of influence over the future Dominican as shall be discussed below.

After completing his initial studies in the arts, in October 1605 Poinsot continued with a theological course of studies that he would be suspended in short order so that in March 1606 he could accompany his father to Flanders. Poinsot's academic hiatus was brief and he enrolled in the University of Louvain to continue his theological studies, where he earned a baccalaureate in biblical studies in 1608 (Doyle 1998, 117). Concurrent to these studies, Poinsot had been influenced by the Dominican preacher Thomas de Torres (Deely 1994, 262), and so on 17 July 1609, he entered the Dominicans at the Convent of Our Lady of Atocha. One year later to the day (17 July 1610) Poinsot made his formal religious profession and took the name by which he would be known in late scholasticism: John of St. Thomas.

While at Atocha, Poinsot spent five additional years (1610–1615) with philosophical and theological studies, and then from 1615 to 1620, he accepted responsibilities as a teacher in the arts (Doyle 1998, 117–18). His teaching career next took him to the Dominican priory at Plasencia where he lectured in theology for 5 years before being sent to the University of Alcalá. At Alcalá he was tasked with mounting responsibilities both within the Order of Preachers and beyond: first, as regent of studies in 1626 and, then, in 1627 as a consultant to the Supreme Council of the Spanish Inquisition. Nevertheless, Poinsot's development as a scholar continued unabatedly, and on 27 July 1630, he attained the cátedra de vísperas, which he held until 1640. Meanwhile, in 1633 Poinsot completed his doctorate in theology and began work on his *Cursus philosophicus thomisticus* (Doyle 1998, 118), which he published in Rome between 1637 and 1638. Upon completion of that project, Poinsot undertook another project, one that would

systematize theology, which he published as the *Cursus theologicus*. Eventually, on 1 October 1641, Poinsot assumed the cátedra de prima after its previous occupant, Peter of Tapia, became the bishop of Segovia (Ramirez and Combefis 1885, col. 804).

Poinsot had to abandon this final position in 1643 when King Philip IV selected the Dominican as his confessor. He accompanied Philip on military campaigns, and it was during Philip's siege of Lérida that Poinsot fell ill. On 17 June 1644, Poinsot died at the age of 55. His remains were transferred to the Convent of Our Lady of Atocha, where he had begun his religious career over three decades earlier.

Logic

Poinsot's *Cursus philosophicus thomisticus* opens with a two-part treatise on logic. He begins with the recognition that "In all arts two things must especially be considered, namely, the matter on which the art is performed, and the form, which is induced in such matter" (*Log.*, I prol., prae. 2). With respect to logic – which here Poinsot evidently regards as an art but elsewhere more properly as a (speculative) science (*Log.*, II, q. 1, a. 4) – there will likewise be a twofold consideration. Accordingly, the first – and notably shorter – part of his *Ars logica* is devoted to the study of formal logic, while the second, longer part takes up his material logic.

Formal Logic

Poinsot's discussion of formal logic unfolds according to the three operations of the intellect: simple apprehension (*simplex apprehensio*), judgment (or as he puts it composing or dividing), and reasoning in which one moves discursively and infers some truth from a prior known truth. He begins with a treatment of the "ultimate terms of resolution" that constitute discursive reasoning, namely, the terms composing the subject and predicate of propositions, before moving on to a discussion of signs (*signa*),

names (*nomina*), and *verba*. Following the operations of the intellect, Poinsot examines what pertains to judgment (i.e., composing and dividing) with a look at *oratio*, the mode of knowing, definitions, dividing, argumentation, and propositions and their kinds, in addition to other related issues such as supposition, appellation, opposition, and the square of opposition. Finally, with respect to the third act of the intellect, reasoning, Poinsot treats induction, syllogisms (and their modes), fallacies, and various argument forms.

Material Logic

While Poinsot's formal logic largely parallels the *Prior Analytics* of Aristotle and Peter of Spain's *Summulae logicales* (Doyle 1998, 118), his substantially longer material logic unfolds what can be found in the *Posterior Analytics*, viz., the elements of and requirements for a science (*scientia*); the *Topics*, with matters related to probability; the *Sophistic Refutations*; and the rest of the works from the *Organon*, viz., matters pertaining to demonstration, probability, and dialectics. Among the first questions Poinsot addresses is whether or not logic is an art or a science. Having already given some indication that logic functions as an art in the prior section, here Poinsot fills out his account and explains that because logic performs demonstrative acts, it "is truly and properly a science, and, however, it is simultaneously a liberal art" (*Log.* II, q. 1, a. 2). Furthermore, according to Poinsot, the formal and adequate object of logic is *ens rationis*, not in all of its extension (e.g., privations and negations), but in terms of "relations," which Poinsot understands in terms of the logical intentions (*Log.* II, q. 1, a. 3).

Also of note in Poinsot's material logic is his rejection of Duns Scotus's teaching on univocity in support of Cajetan's theory of proper proportionality. Cajetan, says Poinsot, has "fully and subtly" addressed the difficulties involved with analogy in the *De nominum analogia* such that he has left very little for Poinsot himself to add (*Log.* II, q. 13, a. 3). Citing the same divisions as

Cajetan of analogy (viz., inequality, attribution, and proper proportion) and finding textual support for this division in Thomas Aquinas's *Sentences* I, d. 19, q. 5, a. 2, ad 1 (ibid.), Poinsot follows Cajetan according to the primacy of proper proportionality (*Log.* II, q. 13, a. 4).

Occupying questions 21 through 23 is Poinsot's important treatise on signs which, among the questions of the *Ars logica*, perhaps best manifests the influence of the Conimbricenses, for whom semiotics was a perennial concern (Doyle 1998, 118). Each sign, whether it be formal or instrumental, fundamentally represents something other than itself (*repraesentat aliud*) to a knower (*Log.* II, q. 21, a. 1). For Poinsot, the characteristic of signs is their relational character, but, he points out, such relation is not predicamental; rather, it is transcendental or a relation "*secundum esse*" (ibid.). Predicamental relations will not suffice since some signs refer not only to things but to *entia rationis* or relations of reason, which are not real (i.e., predicamental) beings (ibid.). In sketching out his semiotic theory, Poinsot concerns himself with real relations (which determine natural signs [*Log.* II, q. 21, a. 2]), the nature of the terms involved in the relations (ibid., a. 3), extrinsic relations (ibid., a. 4), and the formal and effective causes of signification (ibid., a. 5). Important for Poinsot's consideration here is the division of signs into formal and instrumental (*Log.* II, q. 22). As an instance of the former, Poinsot holds that concepts or expressed species are most properly signs and so too are the sensible species expressed in the knower's sense power (*Log.* II, q. 22, a. 2).

Poinsot's material logic concludes with an examination of science considered as: distinct from some evident *habitus* (*Log.* II, q. 26, a. 1), as subaltern (ibid., aa. 2–3), and the relation of science to "*habitus inevidentes*," i.e., opinion, belief, and suspicion (ibid., a. 4). Of particular concern for Poinsot is the relationship between science, on one hand, and opinion and faith, on the other, and whether or not they are incompatible (ibid., a. 5). Finally, Poinsot closes his *Ars*

logica with a treatment of what constitutes the unity and diversity of sciences (*Log.* II, q. 27).

Natural Philosophy

The remaining two volumes of Poinsot's *Cursus philosophicus thomisticus* contain his philosophy of nature. These volumes are organized according to a fourfold division: common mobile being, corruptible mobile being, incorruptible mobile being, and mobile animate being. In its actual execution, however, Poinsot only brings to publication three of the four divisions. Absent is the second part, which was supposed to be a tract of "mobile incorruptible being," that is, a treatise on astronomy (Doyle 1998, 119). There is some speculation that, aware as he was of Galileo's 1633 condemnation, Poinsot was not eager to have his own astronomical theory attract the interests of ecclesiastical observers (Deely 1994, 262).

The first part of Poinsot's natural philosophy, which considers mobile being in general, consists largely of an exposition of Aristotle's *Physics*. It first treats the principles of nature: prime matter (*Phil. Nat.* I, qq. 2–3), form (q. 4), and privation (q. 5), as well as Aristotle's basic hylomorphic theory (qq. 6–8). There is a notable exception, however, to the basic Aristotelian program that Poinsot follows (Doyle 1998, 119). In question seven, Poinsot addresses subsistence and existence, which, as he notes, do not pertain to the constitution of nature itself, but they come (*adveniunt*) to the totality of what nature is. Here, Poinsot follows Thomas Aquinas's teaching that "existence in created things is distinguished really (*a parte rei*) from [their] essence" (*Phil. Nat.* I, q. 7, a. 4).

Concerning the second book of the *Physics*, Poinsot addresses the distinction between nature, art, and the unnatural (*violentus*) (q. 9). Also of significance is his detailed treatment of the four Aristotelian causes (qq. 10–13). Some of the other topics treated are motion and action (q. 14), infinitude (q. 15), place and where (*ubi*) (q. 16), the void (q. 17), and time (q. 18). The first part

concludes with the reduction of eternal motion to a first mover (qq. 23–26). In his argument for a prime mover based on the motion of the world, Poinsot holds two things on faith: first, that the world (and its motion) has no beginning in time and, second, that God produced the world out of no necessity (*Phil. Nat.* I, q. 24, a. 1). Poinsot follows Aristotle in holding that “from motion a first and entirely immobile mover can immediately and directly be demonstrated,” and, following up on this, that certain attributes of this first mover can be determined as that which is commensurate with pure act. Also important to Poinsot here are Thomas Aquinas’s two premises found in the *prima via* that “everything that is moved is moved by another” and “an infinite regress in moved movers is impossible” (*Phil. Nat.* I, q. 24, a. 3).

The third part of Poinsot’s natural philosophy extends beyond the *Physics* and elucidates Aristotle’s *De generatione et corruptione* and *Meteorologica*. Poinsot devotes 12 questions to the former text ranging over issues such as the generation of substances and their corruption, alteration, intension and remission, action and reaction, mixtures, condensation and rarefaction, nutrition, and growth. He ends his discussion of the first book of *De generatione et corruptione* with a discussion of the principle of individuation, which, Thomist that he is, he identifies with quantified signate matter (*Phil. Nat.* III, q. 9, a. 4). The remaining questions deal with elements and first qualities (q. 10), mixtures (q. 11), and reproduction (q. 12). His work on meteorology is relatively short and addresses the standard terrestrial and sublunary phenomena of the day such as the moon and its phases, meteors, comets, thunder, lightning, and even rainbows, wind, clouds, and rain. His last tractate in this section concerns metals: their efficient causes, kinds, and specific properties.

Poinsot concludes his exploration of natural philosophy with a 12-question volume on animate being, which corresponds to Aristotle’s *De anima*. He begins with a consideration of the soul in general. Poinsot argues against the Scotistic school and before it Avicenna, who maintained a

plurality of substantial forms in one and the same composite substance (*Phil. Nat.* IV, q. 1, a. 3). He then discusses various kinds of souls and their powers beginning with vegetative souls and moving to sensitive souls. Poinsot closes his discussion of the soul with an examination of intellectual souls, their immortality, and their faculties. Beginning with question nine, Poinsot’s focus shifts to the intellectual soul together with its faculties, concept formation, and will.

Cursus theologicus

Poinsot opens his *Cursus theologicus* with a discussion of the scientific character of theology. “Theology,” he says, “is knowledge about God which is reasoned to. . .” (*CT* I, q. 1, d. 2, a. 1, n. 1). Like Aquinas, Poinsot considers the discursive and syllogistic character of theology to be indicative of its scientific character. Unique to Poinsot is his understanding of theology as functioning in a mediate, revelatory capacity whereby that which is virtually contained in the articles of faith – the premises of theology – is made manifest through reasoning (*CT* I, q. 1, d. 2, a. 7, n. 11bis). For Poinsot, faith (supplying at least one if not both of the premises of theology) and reason (the discursive character of scientific theology) serve as the cognitive matrix where grace and nature meet in an intermingled synthesis. Additionally, the natural light of reason can itself supply a premise in a theological syllogism to be united to another premise supplied by the articles of faith. In fact, Poinsot holds that “Many of the demonstrations which are made in theology are usually reasoned from one premise of faith and another which is known by the natural light (*lumen*) [of reason]. . .” (*CT* I, q. 1, disp. 2, a. 6, n. 1).

Beyond matters that are strictly concerned with theology proper, the *Cursus theologicus* also affords Poinsot the occasion to discuss many of his metaphysical theories, for example, proofs for God’s existence (*ibid.*, I, q. 2, disp. 3, a. 2), the divine science (*ibid.*, I, q., 14, disp. 17), the Thomistic understanding of the relationship between *esse* and essence as act and potency, etc. It is within these more metaphysical contexts that

Suárez's influence (noted above) is perhaps most keenly observed. For instance, Poinsot, when reflecting upon the relationship between *esse* and essence understood in terms of act and potency, holds fast to Thomas Aquinas's teaching that act is limited by potency (ibid., I, q. 7, disp. 7, a. un., n. 2), yet at times seems to do so only tentatively. For instance, when arguing for God's infinity, Poinsot, though he takes exception to Suárez and Gabriel Vázquez – who argue that *esse* is not limited by potency since *esse* and essence are not distinct – does not find maintaining a real distinction between the two as essential. That is, while Poinsot himself holds to the real distinction, he thinks it sufficient to hold that a creature can be limited “objectively,” which is to say, in terms of its metaphysical dependence upon God. Accordingly, a creature's limitation need not be attributed to its being subjectively limited through its being received into some subject. God, of course, is not dependent in any way and so experiences neither objective nor subjective modes of limitation. The upshot of this argument is that the centrality of the Thomistic real distinction is seemingly displaced (Pereira 2007, 159–64).

Another area of Suárez's influence is Poinsot's consideration of God as “subsistent intellection” (ibid., 166–71). Thomas consistently describes God as subsistent being itself (*ipsum esse subsistens*) (cf. *Summa theologiae* I, q. 3, a. 4). Suárez, in contrast, is much more concerned with accommodating the Trinitarian processions within the Godhead (*DM* 30.15.15), and so, while he too understands God as subsistent being (ibid., 28.1.13), the *Doctor eximius* speaks of God in terms of “subsistent intelligence” (ibid., 30.15.15). Poinsot follows suit and, without gain-saying Thomas Aquinas's understanding of God as subsistent being, through which the divine being can be differentiated from created being, such a description is insufficient to the task of signifying, let alone differentiating, the divine Persons within the Godhead (*CTI*, q. 14, disp. 16, a. 2, n. 9). God's “primary principle of operation,” which is intellection, does, however, serve precisely as a means to identify a difference within the Godhead (ibid., I, d. 16, a. 2, n. 19). Accordingly, Poinsot follows

Suárez in holding that God is properly understood as subsistent intellection (Pereira 2007, 169–70).

Abstract

Reginald Pole was a member of the Plantagenet royal house of England and graduated in Arts from Oxford University. In 1521, he was sent by King Henry VIII (1491–1547) to study in Padua, Italy, where he became an enthusiast of the “Christian philosophy” of the Italian Renaissance. During the 1520s and 1530s, he devoted himself increasingly to biblical study and came to believe that faith in God, as revealed in Christ, surpassed all human knowledge and should be the goal of Christians. Pole was able to put some of his ideas into practice, as a cardinal of the Roman Church, from 1536; as papal legate, on several occasions, to England, France, and Emperor Charles V (1500–1558); and as archbishop of Canterbury (1556–1558). In the last 5 years of his life, he worked with Queen Mary I (1516–1558), and her husband Philip (1527–1598), to restore Catholicism in England. Most of his achievement was reversed after his death, but in Catholic Europe, he retained a reputation as a holy man and a Catholic reformer (Mayer, *Cardinal Pole in European perspective*. Aldershot, 2000; Edwards, *Archbishop Pole*. Farnham: Ashgate, 2014).

Biography

Reginald Pole was the fourth child of Sir Richard Pole (1462–1505) and Margaret Plantagenet (1473–1541), who was a niece of King Edward IV (1442–1483) of England and countess of Salisbury. He was educated at Magdalen College,

Oxford University, graduating with a Bachelor of Arts in 1515. In 1521, King Henry VIII sent him to study at the University of Padua, and although he seems not to have matriculated there, he spent about 5 years in Italy, forming part of the circle of Niccolò Leonico Tomeo (1456–1531). In Padua, he continued his studies in Classical and Renaissance philosophy and became increasingly interested in theology. In the 1520s, it seemed likely that he would become a courtier of Henry VIII, and in 1529, he was sent by the king as part of a delegation to the Theology Faculty of the University of Paris, which succeeded in gaining the theologians' support for Henry's divorce from his first wife, Katherine of Aragon (1485–1536) (Edwards 2014:1–29). After he returned to England from Paris, he turned against his royal master, opposing both the divorce of Katherine and King Henry's separation from the Roman Catholic Church and Henry's adoption of the title and role of Supreme Head of the English Church.

Pole returned to Italy in 1531 and remained there until 1553. In December 1536, he was appointed a cardinal by Pope Paul III (1468–1549), taking part in a papal commission to reform the Church and prepare for the General Council which eventually opened at Trent in December 1545. In the meantime, he was appointed as papal legate to France and the Holy Roman Empire, with the aim of securing peace between those two major Catholic powers. He was also named as papal legate to England, and his support of the traditionalist rebellion in the north of the kingdom in 1536–1537, known as the “Pilgrimage of Grace,” led to the execution of his brother Henry Pole, Baron Montagu (1492–1539), as well as other friends and relatives, who were accused of conspiring with him against the king. During these years, Pole made various attempts to return to his homeland, but it was only Mary I's accession to the English throne, in July 1553, that enabled him to do so. As papal legate to England once again, now on behalf of Julius III (1487–1555), he masterminded the restoration of Catholicism in England, Wales, and Ireland, continuing this process until he and Queen Mary died on the same day, 17 November 1558. In the 1540s, while governor of Viterbo and

Bagnoregio, in the Papal States, Pole and his circle had been suspected of “Lutheran” views and, during his last years in England, this suspicion resurfaced, in the reign of his former friend, but now his enemy on theological grounds, Pope Paul IV (Gian Pietro Carafa 1476–1559). Pole died under threat of trial by the Roman Inquisition, and the next queen, Elizabeth I (1533–1603), undid most of his ecclesiastical work, separating once again from Rome and restoring the vernacular liturgy of the Church of England, which had been introduced under Edward VI (1537–1553). Nevertheless, Reginald Pole subsequently became an inspiration to Catholics, in England and Wales and on the Continent of Europe, for what was regarded by many as his saintly life and for his contribution to the reforms decreed by the Council of Trent (1545–1563) (Mayer 2000a, b; Edwards 2014).

Heritage and Rupture with the Tradition

During Pole’s time as a student at Oxford University, Oxford retained a medieval Arts syllabus, based on the *trivium* and *quadrivium*, but his own college, Magdalen, was at the forefront of teaching Classical languages, literature, and philosophy, in addition to the prescribed subjects. One of his college tutors, William Latimer (c.1467–1545), had previously been a pupil of Leonico at Padua. Evidence of Pole’s own intellectual development in Italy, between 1521 and 1526, comes from personal correspondence. No doubt building on foundations laid during his time in Oxford; he is known to have read deeply in Greek philosophy, including the works of Plato (circa 428/423 BCE), Aristotle (383–321 BCE), Galen (130–200 CE), the Academics, and the Peripatetics. By the early 1530s, when Henry VIII was trying to divorce his wife Katherine and beginning to threaten to break with the Church of Rome, Pole wrote to his friends, including Jacopo Sadoletto (1477–1547), bishop of Carpentras, and Pietro Bembo (1470–1547), that scholars of their own time were more fortunate than the Classical Greeks and Romans, because they had been given the light of the Christian

Gospel and had the Son of God as their guide. By this time, Pole’s interest had moved from philosophy to theology, and he regarded this as a progression to a higher science. By 1534, he had concluded, as he wrote to Sadoletto, that doctrine and ethics were far more important than those favorite pastimes of the Renaissance, poetry, and oratory. He still shared with his humanist friends the belief that the philosopher Plato was capable of leading a person to God. Even so, he now thought that reliance on the human senses and intellect would have ultimately to be abandoned, in favor of the recognition that humans, of themselves, could not have any knowledge that was truly sure and certain. Instead, he thought that anyone who sought the truth about the world and human existence must strive for, and maintain, faith in the Christian Trinitarian God. Only in that way could he (or she?) receive the benefit (*beneficium*) of Christ’s saving acts.

Despite this development of his views in the 1530s, it is still true that, although he would later be primarily associated with the main theological issues in sixteenth-century Europe, he was steeped in the “new learning” of the Renaissance. From his first stay in Padua until his death, he would express his religious faith in terms of the Christian humanism associated with Desiderius Erasmus of Rotterdam (1466–1536). In his preaching and writing, Pole avoided the scholastic techniques still used by most theologians of his day. Thus, instead of structuring his work as a series of *quaestiones*, with ample citations from medieval compilers and theologians such as Peter Lombard (1100–1160) and Thomas Aquinas (1225–1274), he used a warmer and at times almost conversational style, frequently quoting, sometimes paraphrasing, or else commenting on Scripture. His emphasis, in both writing and preaching, was on the lived experience of the Christian faith – in the Bible, in Christian history, and in his own day (Edwards 2014: 85–108).

Pole wrote no major or systematic philosophical or theological work, but his most lengthy surviving treatise, generally known as *De unitate*, contains revealing passages about his intellectual methodology and confirms the general points made above. By 1535–1536, when he composed

this somewhat rambling tract, at the request of King Henry VIII of England, he seems to have fully developed his approach to exegesis, incorporating the humanistic techniques and approaches which he had learned in Oxford and especially in Italy. The fact that Henry and his supporters used biblical quotation and arguments to justify his divorce from Katherine enabled Pole to deploy his own scriptural study in opposition to it. Thus, in various passages of the *De unitate*, he criticized the methods used by his opponents, particularly concerning the nature of authority in the Catholic Church. In this lengthy and sometimes rambling treatise, Pole repeatedly built up arguments on the basis of biblical texts, in order to justify papal authority over the Church and over Christian rulers. A fine example is Pole's discussion of the fundamental question of whether, as the Roman Catholic Church claimed, St Peter, in New Testament times, had superiority over the other apostles, hence justifying and validating the papacy. Having discussed, in quite a sophisticated way, the meaning of the metaphysical use of the word "rock" in relation to Jesus's famous statement to Simon Peter ("You are Peter, and on this rock I will build my Church"), Pole followed the principles and method of many biblical scholars in the Renaissance, by seeking concord between the four Gospel accounts. In addressing the question of whether there was a hierarchy among Jesus's first disciples, Pole referred to the commissioning of the original apostles (Matthew 10; Mark 3) but focused particularly on Luke's account of the Last Supper (Luke 22). In his version of Jesus's rejection, on this occasion, of any such notions of supremacy, Pole combined the techniques of medieval glossators and Renaissance "Christian philosophers" by putting his own words into Jesus's mouth, referring to Christ's imminent betrayal by Judas. Both in *De unitate* and elsewhere, Pole did not provide a systematic biblical commentary of the kind that would appear in later centuries, but he was clearly fully aware of current scholarly developments on the subject, in Italy and elsewhere (Pole 1538; Pole and Dwyer 1965).

Innovative and Original Aspects

Pole was part of an innovative movement or tendency, among Catholic scholars and clergy, rather than producing original philosophical ideas of his own. His achievement was largely practical rather than theoretical. He put into practice, while in England as papal legate and as archbishop of Canterbury, some of the ideas about Christian teaching and worship that were shared and developed by his friends in Italy, in the 1520s–1540s. Although most of his work, between 1554 and 1558, involved the restoration of traditional Catholic observance and belief in England, his occasional sermons, some of which survive, indicate his Christian humanist approach (Fenlon 2005; Duffy 2006; Edwards 2014, 215–221).

Impact and Legacy

At his death, Pole's program of restoration and reform was incomplete, and the fact that he and Queen Mary died on the same day, meant that his legacy depended entirely on the new Queen, Elizabeth. She was a half-sister to her predecessor and the daughter of Henry VIII's second wife, Anne Boleyn (1501–1536). Elizabeth quickly set about dismantling Mary and Pole's work in the Church, by separating once more from the See of Rome, and using Parliament to restore, with a few minor revisions, the 1552 Book of Common Prayer as the liturgy of the English Church, and having herself declared its Supreme Governor. Her choice as the new archbishop of Canterbury, Matthew Parker (1504–1575), not only worked to put Elizabeth's ecclesiastical policies into effect but also did his best to vilify his predecessor and deny his achievement (Edwards 2014:249–262). Yet things would be very different in Catholic Europe, where the decrees of his London Synod, held in 1555–1556, were published as guides for the final sessions of the Council of Trent (1562–1563) (Pole 1562). In the Roman Catholic Church, he was primarily remembered as a Catholic reformer, but in that capacity, he nonetheless represented an important current in "Erasmian" Christian philosophy.

Polish Renaissance Philosophy

W. Julian Korab-Karpowicz

Faculty of Social Sciences, University of Opole, Opole, Poland

Abstract

During the period of Renaissance in Poland (fifteenth–sixteenth century) there was a considerable development of learning that expressed itself, especially in natural and political philosophy. At the University of Krakow, there was a shift from the Aristotelian approach to the study of nature toward new methodologies. The university became well known as a

center of astronomical studies. Nicolaus Copernicus studied in Krakow and then in Bologna and Padua. The result of his scholarly activities was his work *De revolutionibus orbium coelestium* (1543), in which he presented the heliocentric model of the solar system and by which he significantly contributed to the Scientific Revolution and to the development of modern science. Political philosophy, which developed in Poland at that time, had also many outstanding representatives and contributed to the country's distinct national character. Polish political philosophers emphasized the unity between politics and ethics. The stress on national independence, clearly evident in Ostrorog's writings, has become a part of Poland's lasting heritage. Another political philosopher, Modrzewski argued that in order to improve conditions in any country it was essential first to improve citizens' morals. Goslicki emphasized the value of ancestral virtues and traditions, and claimed that because of cultural differences between nations, different countries could be governed by different laws. Gornicki tried to identify problems in Poland's political system and propose solutions. He and other Renaissance philosophers that we introduce are perhaps the most distinguished thinkers of that period, who, coming from Poland and being educated abroad, especially in Italy, synthesized Polish and European learning and expressed this in their works.

Introduction

The Renaissance in Poland (Polish: *Renesans, Odrodzenie*) lasted from the late fifteenth to the late sixteenth century and is widely considered to have been the Golden Age of Polish culture. Many distinguished citizens of the Kingdom of Poland (and from 1569 of the Polish–Lithuanian Commonwealth) were actively involved in the European Renaissance. During that period, the country already had a well-developed educational system consisting of over 2500 schools and three universities (in Krakow, Vilnius and Zamość). Young Polish graduates, especially sons of

nobility (*szlachta*), traveled abroad to continue their education. The most popular destinations were Italian universities: Padua, Bologna, and Florence. Moreover, many Italian artists and architects traveled to, and spent some years in, Poland. Among them were Francesco Fiorentino, Bartolommeo Berrecci, Santi Gucci, Mateo Gucci, Bernardo Morando, Giovanni Battista di Quadro, and others. The Renaissance period, famously supportive of artistic and intellectual pursuits, produced outstanding philosophers, scientists, poets, artists, and literary persons. Among them are natural philosophers and scientists: Mikolaj Kopernik (Nicolaus Copernicus), Wojciech z Brudzewa (Albertus de Brudzewo), Jan z Glogowa (Joannes Glogouiensis); political philosophers and thinkers: Jan Ostroróg (Joannes Ostrorog), Andrzej Frycz Modrzewski (Andreas Fricius Modrevius), Wawrzyniec Grzymała Goślicki (Laurentius Grimaldus Goslicius), Lukasz Górnicki (Lucas Gornicki), Jan Zamoyski (Joannes Zamoyski), Jakub Gorski (Jacobus Gorscius), Stanisław Orzechowski (Stanislaus Orzechowski), and Andrzej Wolan (Andreas Volanus); poets: Mikolaj Rej (Nicholas Rey) and Jan Kochanowski (Joannes Cochanovius); composers: Waclaw z Szamotul (Venceslaus Samotulinus) and Mikolaj Gomółka (Nicolaus Gomolka); and painters: Stanisław Samostrzelnik (Stanislaus Claratumbensis) and Marcin Kober (Martin Kober). At that time, there was a considerable development of learning that expressed itself, especially in natural and political philosophy.

Natural Philosophy: Methodological Pluralism and Scientific Revolution

In the fifteenth century, at the University of Krakow, there was a slow turn from the Aristotelian approach to the study of nature to new methodologies based on the use of mathematics, experience, and observation. A noteworthy influence came from the French nominalist philosopher Jean Buridan (Latin: Johannes Buridanus, c. 1300–c. 1358/61), whose work *Subtilissimae quaestiones super octo Physicorum libros*

Aristotelis, was used in lectures on Aristotle's physics. The nominalists believed that certain knowledge can be achieved only through the investigation of material things and of the concrete, and in physics by studying *corpus in motu*, the body in motion, rather than of mere being in motion. They introduced to the University of Krakow methodological pluralism and eclecticism, which combined medieval realism with nominalism and created an atmosphere conducive to scientific inquiry. As a result of these developments, the university became well known as a center of astronomical studies. Krakow's scholars were particularly interested in the problem of the movement and location of the Earth. On the basis of their investigations, they started to develop doubts concerning the accuracy of the Ptolemy geocentric system. Albertus de Brudzewo (Polish: Wojciech z Brudzewa) (c.1445–c.1497), the author of *Commentariolus super theoricis novis Georgii Purbachii*, collected important evidence for the falsity of Ptolemy's system. His student was Nicolaus Copernicus.

Nicolaus Copernicus (Polish: Mikolaj Kopernik) (1473–1543) was born in Royal Prussia, which was then a province of the Kingdom of Poland, and studied in Krakow and subsequently in Bologna and Padua. After his return to his home country, he engaged himself in various administrative-economic duties at the Lidzbark Warminski (German: Heilsberg, Ermland) palace of prince-bishop Lucas Watzenrode (1447–1512), who was both the spiritual and the secular leader of Warmia, an autonomous part of Royal Prussia, and his uncle and patron. While performing public functions, Copernicus clearly identified himself with the Polish state and, like his uncle, defended Warmia against the Teutonic Order's plans of conquest. He had proven himself to be a talented administrator and economist, who by his writings, particularly his essay *Monetae cudendae ratio* (On Coining Money, 1526), had contributed to his province's monetary reform. However, administrative-economic duties did not prevent him from astrological observations and scholarly activities. The final result was his major work *De revolutionibus orbium coelestium* (On the Revolutions of the Celestial Spheres, 1543), in which

he presented the heliocentric model of the solar system. His epochal discovery that it was the Earth that moved around the Sun, which challenged the commonly accepted geocentric view of the Earth being the center of the universe, was inspired by both his empirical observations and his readings of ancient Greek philosophy. The authority of Aristotle supported the geocentric model, but the Pythagorean philosophers, especially Hicetas of Syracuse (c. 400–335 BC), to whom Copernicus referred as *Nicetus Syracusanus* (Nicetus of Syracuse) in his *De revolutionibus*, argued that it was the Earth that moved, with the sun, the moon, the stars remaining still. The movement of the Earth around its axis would not yet explain the observable movements of heavenly bodies but it provided Copernicus with a useful hint leading him to the conclusion that “any visible movement on the firmament does not come from the firmament itself but from the movement of the Earth” (*Commentariolus*, 1514). He had found additional hints about the Earth movement in some later commentaries to the writings of the Pythagorean Philolaus of Croton (c. 470–385) and of the astronomer Aristarchus of Samos (c. 310–230 BC). Finally, in his research, Copernicus was also guided by the mystical idea of spiritual transformation. He believed that his reform in astronomy had at the same time a profound religious significance, leading from the Earth to the Sun, that is, from a human and earthly oriented world to a divine and heavenly oriented one. By designing his heliocentric model of the solar system, he made a momentous contribution to the Scientific Revolution and to the development of modern science.

Political Philosophy: Unity of Politics and Ethics

Political philosophy, which developed during the early Renaissance period, had many outstanding representatives in Poland and contributed to the country's distinct national character and its unique political system, which is often described as a “nobles’ democracy” (Polish: *demokracja*

szlachecka) or simply as *Res Publica* (Commonwealth/Republic, Polish: *Rzeczpospolita*), a republic with a king, who was elected for life by the nobility.

Polish Renaissance political thinkers emphasized the unity between politics and ethics. The Machiavellian ideas leading to the separation between moral values and political practice had never become popular in Poland, and thus the Polish political outlook, to which these thinkers contributed, had been largely idealistic. On the one hand, they adopted a classical perspective based on virtue; on the other, they supported progressive ideas. The predominantly religious and cosmopolitan attitude of the Middle Ages was replaced in their writings by a modern approach, which would put stress on the secular and independent state and the idea of a nation.

Jan Ostroróg (Latin: Joannes Ostrorog, 1431–1501), born one generation before Niccolò Machiavelli, and educated at universities in Erfurt and Bologna, was a distinguished public official and diplomat, negotiating among others peace conditions after the 13 Years’ War (1454–1466), which was fought between the Kingdom of Poland allied with pro-Polish Prussian Confederation and the State of the Teutonic Order (German: *Staat des Deutschen Ordens*). He is best known for his work *Monumentum pro Reipublicae ordinatione* (A memorandum on regulating the Republic, ca. 1475), in which he called for fundamental political reforms. He supported strengthening the King’s formal powers, universal conscription, writing of laws in Polish, the separation of the state and the church, and Poland’s sovereignty. He argued that the Kingdom of Poland was “in all respects free”. It was free de facto, because the Polish King did not yield to any external power, and *de jure*, because the King did not consider any external jurisdiction except that of God. In his view, the power of the King of Poland was derived directly from God rather than bestowed by the pope or the emperor. The power of the pope, he claimed, was limited to religious issues and should not extend to worldly affairs. This stress on national independence, clearly evident in Ostroróg’s writings, became a part of Poland’s lasting heritage.

Andrzej Frycz Modrzewski (Latin: Andreas Fricius Modrevius, 1503–1572). Another well-known political philosopher of that period was Andrzej Frycz Modrzewski. He studied in Krakow and Wittenberg, and then served as a King's secretary and diplomat. In *Commentariorum de Republica emendanda libri quinque* (1551), divided into five parts – “On mores,” “On laws,” “On war,” “On the Church,” “On education” – he proposed various ways to improve states. His work, originally written in Latin, was translated into French, German, and Spanish and was referred to by a number of scholars, including Jean Bodin, who simplified Modrzewski's family name to “Andreas Riccius.” Modrzewski argued that in order to improve conditions in any country, it is essential first to improve citizens' morals, which, he claimed, are not merely subjective or based on mere opinions but have their source in the nature of things and in God's decrees, written deeply in human hearts. As it was for Aristotle, for Modrzewski politics was an extension of ethics, and required the cultivation of virtues. As they were for St. Thomas Aquinas, positive laws were for him the work of reason and required compliance with the natural and divine laws. As it did later for Locke, freedom consisted for him in the obedience to self-imposed laws, and was not license doing as one likes. Modrzewski identified the ideal social life with order, virtues, and labor and saw its opposite in conflict and war. Human beings, he believed, were naturally cooperative and social, and any form of superiority or domination among them could only be justified on the basis of greater reason and superior virtue. Therefore, he was critical of hereditary nobility. He claimed that public offices should not be inherited but elected on the basis of qualifications. While these ideas were rare at his time, he was not a revolutionary. Instead of seeking to overthrow the existing order based on inheritance and rigid class divisions, he aimed at changing prevailing social customs and ways of thinking. He argued that nobility was a quality related to virtue rather than to ancestry and was against reserving higher positions in the government and in the Church for the nobles. He also stood against any legal or penal inequalities and

claimed that no one should be a judge in one's own case. Thus, according to him, landlords could not have jurisdiction over peasants working for them, but should be equally subjected to law, the same for all.

Wawrzyniec Grzymała Goślicki (Latin: Laurentius Grimaldius Goslicius, ca. 1530–1607) studied in Krakow and then in Padua and Bologna, and after his return to Poland joined the royal chancery and served as a secretary to two kings: Sigismund II Augustus (Polish: Zygmunt August) and then Stephen Báthory (Polish: Stefan Batory). He also became a priest and was successively appointed bishop of Kamieniec Podolski (1586), Chelm (1590), Przemyśl (1591) and Poznań (1601). A man of affairs and a political philosopher, he is best known for *De optimo Senatore*, originally published in Venice in 1568. While appreciating the humanist knowledge that he received during his studies abroad, he stressed in this work that one should never disregard one's own ancestral virtues and traditions. This conservative outlook, and the ideas of civil liberty, wise statesmanship, and nobles' democracy that he promoted, had a special appeal in England. *De optimo Senatore* was translated into English and had four different editions: 1598 (*The Counsellor*), 1607 (*A commonwealth of Good Counsellor*), 1733 (*The Accomplished Senator*), and most recently, 1994 (*The Accomplished Senator*). It became a political and social classic, read by Queen Elizabeth I of England and by William Shakespeare. It was popular among opposition forces to the Stuart monarchy and was widely quoted in revolutionary pamphlets during the period preceding the British Civil War of 1640. *De optimo Senatore* was written for a European audience, and not merely for people in Poland. Goślicki considered politics a science. To make correct political decisions, he claimed, the leader should employ both philosophy (reason) and history (experience). The empirical aspect of his approach consisted in looking at similar historical cases, as well as on such factors as soil, climate, and other conditions prevailing in a given country, and by considering these, formulating appropriate policies. Then his rationalism was expressed in the idea of *scientia civilis*, of

political science that was oriented on the public good and ultimately aimed at happiness in this world, and not in a transcendent world beyond. Goślicki was a devout Catholic and believed in the creation of the universe and its continuous government by God. However, he also believed that a special role in the divine government was given to human beings, who, according to God's plan, should exercise their leadership role in a wise and just manner. The ultimate goal of human life was happiness, which, he thought, was not a definite concept, but an idea related to specific living conditions and particular human needs. Like other Polish Renaissance political thinkers, he emphasized the role of moral values and linked happiness in society with virtue. As the most important political virtue, he regarded prudence as practical wisdom: an ability to correctly judge, predict events and make the right decisions. He emphasized that to ensure good government, prudence must be linked to justice, an ability to give each person what he or she deserves. Another important political virtue for him was friendship, by which individuals, groups, and classes could be linked, thus forming a happy society. While these ideas can be considered universal, Goslicki would also consider cultural differences between nations and claimed that because of these, different countries could be governed by different laws, and that it was laws that should be adjusted to specific countries and not the opposite. According to him, a prudent statesman should always consider what motivates people to action, and promulgate laws improving people morally, rather than those that merely punish them. For moral progress, citizens should exercise the right reason by learning how to recognize what is good and what is harmful, and consequently develop harmonious relationships with others. While Goslicki divided society into citizens, who enjoyed political rights, and subjects, who did not have them, he supported the idea of equality before the law, and in his view, any differences among people could only be justified on the basis of merit; the ultimate title to rule being virtue. Those who aspired to become political leaders were thus obliged to work on their perfection. The division of government into legislative, juridical, and executive that

he proposed was to ensure that human relationships are based on justice and goodness. The politics that he envisioned had a profoundly moral character.

Lukasz Górnicki (Latin: Lucas Gornicki, 1527–1603) studied at universities in Krakow and Padua, and, after his return to Poland, he performed various public functions and became a personal secretary and chancellor of the Polish king, Sigismund II Augustus. He authored a few works, of which the best known is *Dworzanin polski* (The Polish Courtier), published in 1566. This book was his unique translation and adaptation to Poland's needs of Baldassare Castiglione's *Il cortegiano* (The Courtier), which had been widely studied throughout Europe since it first appeared in 1528. A simple translation of this famous book, Górnicki believed, would not be successful because of the vast cultural gap between Italians and Poles, especially those parochial "domestic Poles" who would not study or travel abroad. His ambition was to enrich Polish culture with his version of *The Courtier* and to make Poland a more cosmopolitan place. This was also very much in line with the objectives of the King's court, particularly Queen Bona Sforza, Sigismund II Augustus' Italian mother. The continuation of this ambitious project was Gornicki's systematic work in political philosophy: *O elekcji, wolności, prawie i obyczajach polskich* (On elections, freedom, law and Polish customs), which was published posthumously in 1616. Its practical aim was to identify problems in Poland's political system and propose solutions. Having the literary form of a dialogue between a domestic Pole, representing backward views, and an Italian, representing novelty, this work tried to promote the spirit of reform. However, it was also based on classical and Christian concepts, particularly on the four cardinal classical virtues, the most important of which was, for Górnicki, justice, and the Christian virtue of love. If there is true love among people, Górnicki argued, there is no need for laws. But even if we have laws, he thought, they could not be really effective without love and goodwill among citizens. Thus, on these values a political community is to be founded, laws being insufficient by

themselves to stop wrongdoing. Hence, like other Polish political thinkers, Górnicki emphasized the importance of moral values in politics. He also made some practical proposals, including court reforms, to make laws effective, postulated that rulers should execute power with wisdom, and supported monarchy as the best possible political system because, as he claimed, it was always easier to find one wise person for the helm than many.

Impact and Legacy: The End of the Golden Age

The Renaissance philosophers introduced above are perhaps among the most distinguished thinkers of that period, who, coming from Poland and being educated abroad, especially in Italy, synthesized Polish and European learning and expressed this in their works. This auspicious age for science and culture ended with wars. Scientific and cultural developments require peace and are disrupted by armed conflicts, especially if they happen in the country's territory. Wars against Sweden, Russia, and Turkey and the Cossack rebellion, which occurred in the seventeenth century, weakened the old *Rzeczpospolita*. They contributed to the decline of scholarly activities and to the breaking of ties with centers of learning abroad. Only in the middle of the eighteenth century, because of the ideas of the Enlightenment and a number of brilliant individuals who were born around that time, did Poland restore its intellectual strength. The outstanding result of the work of Polish intellectuals was the Constitution of 3 May 1791, which is often described as Europe's first national constitution (and the second oldest in the world after the American Constitution of 1787). It was designed as a legal framework to implement social and political reforms, and repair the Polish state. But this was already too late. With the third partition of the country's territory in 1795 among the mighty powers Prussia, Austria, and Russia, whose rulers, influenced by the ideas of

modernity, clearly did not link politics to ethics, Poland was removed from the map of Europe until 1918, when it regained its independence.

Abstract

The Renaissance was a fundamentally political phenomenon, a period of time in which questions about the purpose of political life and the nature of political legitimacy were raised, and in which actual Renaissance regimes took the first steps towards the modern state. Although the most influential studies have insisted upon a break with the medieval tradition and world outlook, much recent work by both medievalists and Renaissance historians has emphasized the continuity of political thought from the twelfth to the sixteenth century. Yet, proper attention must be paid to the remarkable cultural change within the social and political context that occurred in fifteenth- and sixteenth-century Europe. By that time, constitutional revolutions, expansionist conflicts, and the long dispute between France and Spain brought about the end of the established political balance in Europe and at the same time a crisis in old concepts of politics and government.

Heritage and Rupture with the Tradition

A thorough understanding of modern political thought requires that its foundations be placed

against the medieval background – which, on closer inspection, can be seen to be permeated with most of the basic concepts associated with the Renaissance. The distinction between “humanitas” and “divinitas,” mundane and trans-mundane, natural man and citizen emerging between the twelfth and the fourteenth centuries provided the premises for the secularization of governmental organization, thus paving the way towards the birth of the modern state. At the same time, the idea of civic life as necessary to human fulfillment and virtue, the necessity of testing virtue, and the Ciceronian model of rhetoric as the highest calling for a statesman were also concepts developed before 1400 (Blythe 1992, 2000). Indeed, the origins of the new *scientia politica* must be sought in the works of late medieval theologians, political writers, philosophers, and jurists, such as John of Salisbury, Thomas Aquinas, Dante Alighieri, Ptolemy of Lucca, Bartolus of Sassoferrato, and Marsilius of Padua. Their thought and doctrines must be read in light of the crisis of early representative democracy in northern Italy following the decline of feudalism alongside the weakening of the two universal powers, the church and the Empire, which took place in Europe in the fourteenth century (Ullmann 1977). The relationship between secular and spiritual powers, the supreme political authority and its limits and legitimacy, tyranny, the right to resist, the nature of law, and justifications for coercion were, therefore, the focus of discussion amongst scholastic theorists. However, the political impact of the European turmoil which occurred between the fifteenth and sixteenth centuries was especially manifest in the case of Italy. Due to its turbulent political and cultural life and the arrival of major European powers on its territory, the Italian peninsula underwent a set of social, institutional, religious, and philosophical changes that resulted in a new formulation of the language of politics. Thus, despite – or, perhaps, because of – its patchwork of popular, princely, oligarchical, and ecclesiastical regimes, partly subject to the Empire, partly under the aegis of the church, early modern Italy played a central role in the history of Western political ideas.

Although references to political science appear in the early Middle Ages, it was in the mid-thirteenth century, due to the translation of Aristotle's *Politics* around 1260, and to a lesser extent, of his *Nicomachean Ethics*, that the word *politica* definitively entered the language of Western political thought. From the late eleventh century, nearly all Italian cities and towns from Rome northward had organized themselves into independent city-states or "communes." Compared to the strong central governments of the great monarchies of Europe, these remarkable autonomous urban towns enjoyed relative political freedom and committed themselves to an ideal of free and equal citizenship, albeit narrowly construed, under the rule of law. At that time, early political theorists generally concentrated on practical issues related to urban government, such as the rights and obligations of princes and magistrates, the limits of their authority as well as their relationship to the Roman papacy. However, at the end of the thirteenth century, the Italian city-republics began to fail. William of Moerbeke's Latin rendering in 1268 of Aristotle's ambiguous word *politeia* into a regime as distinct from – or even opposed to – monarchy, a linguistic shift subsequently endorsed by Aquinas and his followers, clearly reflects the political context of the gradual transformation of the relatively free medieval communes into the autocratic *signorie* (Rubinstein 1982). As a result, the meaning of *politeia* to indicate both Aristotle's specific polity – that is, the constitutional or positive rule of the many – and its generic sense of constitution or regime in general, permeated most political texts of the age (Hankins 2019). This was particularly evident in the several Italian scholastic authors dealing with Aristotle's theory of constitution, which implied a discussion about the form of government most apt to prompt and preserve the best ethical and political life. Drawing on Aristotle's theory of the good and corrupt polities, scholastic and renaissance theorists favored some sort of mixed regime that included a monarchical element as well as aristocratic and popular elements (see ► "Government, Renaissance Forms of").

The earliest Italian writer to use the word *politica* in connection with the structure of

communal self-government was Brunetto Latini (c. 1220–1294), a leading member of the Guelf party who is credited with introducing the rules of the *ars dictandi* into the style of the Chancery of the Florentine commune. In his *Rettorica*, a work perhaps written in 1260 dealing with the formation and instruction of the citizen of the contemporary Italian city-state as the emerging governing class, he refers to politics as a branch of practical philosophy along with ethics and economics: "The third *scientia* is politics, for it teaches us to establish, preserve and govern a city or a commune" (Latini, *Rettorica*, argom. 17). A broader definition of *politique* can be found in the almost contemporary *Tresor* (III 73–105), Latini's greatly influential handbook composed for the need of the citizens in a civic context. In the third and final section, entitled "The Government of Cities," he presents politics as "the art necessary to the community of men" and, as such, "the highest wisdom and most noble profession there is among men," while the good citizen is someone who embodies all good civic virtues. Simply put, to live "politically" means to live in brotherhood according to reason and justice. In this perspective, the art of politics was also a vision of civic education. This development can be seen in the treatment of both monarchical and pluralistic governments. Although he favored monarchical rule, Giles of Rome (1247–1316) in his *De regimine principum* (*On the Government of Princes*, c. 1277–79) regarded the political community or the civic life as both the natural goal of men and the necessary condition for a virtuous life. Likewise, in his sympathetic description of republican self-rule, Ptolemy of Lucca (c. 1236–1327), who around 1300–1305 expanded Aquinas's homonymous tract *De regimine principum* (c. 1265), maintained that the main task of the political ruler, an elective magistrate whose power is limited by the laws, is the happiness of the *civitas*, a goal that can be achieved by displaying his own virtue, thus fostering the virtue of the city as a whole. About the same time, another Tuscan Dominican, Remigio de' Girolami (d. 1319), wrote a political tract entitled *De bono communi* (*The Common Good*) in which he stressed the equation between the common good and the good of the commune and

identified the way to accomplish it as obedience to the dictates of justice and right behavior. The intellectual importance of the literature on the city-rule lies precisely in emphasizing the role of politics as the condition within which men could enjoy civil happiness. Accordingly, the main concern of late medieval political theorists was the virtue of the ruler(s), that is, how he may acquire the virtues needed to rule wisely and magnificently (Kempshall 1999). This topic still represented the core of the conventional view of politics in humanist authors and works (Cappelli 2017; Hankins 2019). Indeed, it was only at the end of the sixteenth century that the field of political action was increasingly understood as potentially separate from the norms of justice and religion, thus assessing the pursuit of the common good according to specific contexts and circumstances (political realism).

The idea of “community” and “common good” as ethical values persisted in the political language of Marsilius of Padua (1275–1342), who composed his *Defensor pacis* (*The Defender of Peace*) in 1324, when most of the popular communes in north and central Italy had been replaced by the *signori*. By firmly grounding the concept of the common good, now intended in the Thomistic sense as the public interest, on the legal and constitutional structure of the city-states, Marsilius makes a theoretical attempt to check the advance of the new arbitrary power that was becoming consolidated in Italy. In the *Defensor pacis*, therefore, politics is primarily the art of taking decisions and laying down laws that are conducive to the common good of the city and as a such, the legislative power must be entrusted to those who are most likely to make good laws, that is the citizenry (Viroli 1992; Rubinstein 2004). Furthermore, Marsilius’ theory of the community as *legislator humanus* in a State ruled by the laws and governed with the consent of its citizens, together with his attack on the *plenitudo potestatis* claimed by the Popes, set the art of politics into the realm of *civilis sapientia*, namely wisdom in legislating for, and administering, justice. On this basis, by combining Cicero’s definition of civil law with the Aristotelian formula of man as by nature a political animal, fourteenth-century jurists such as

Bartolus of Sassoferrato (1313–1357) and his great pupil Baldus de Ubaldi (1327–1400) gave the word “politics” a strong juridical connotation. More specifically, they had to confront the delicate question of the independence of the ruler from positive law. As law and politics both aim at the preservation of the political community, they have in view the common good. From this juridical standpoint, whether associated with the self-governing community or the kingly or princely rule, the meaning of politics retained the commitment to the principle of justice, defined as a preference for the common good over private goods. Enforced by the doctrine of public law, this paradigm informed several works of the early years of the fifteenth century, when a “new genre of political literature” began to emerge (Skinner 1978, 2002).

Innovative and Original Aspects

The role of law and justice, the connection between the pursuit of political virtue, and the attainment of happiness along with Aristotle’s notion of humanity’s instinct for political association also represent some of the most recurrent features of the first Italian humanists. Drawing on classical learning, they all operated within a broadly Christian-Aristotelian framework and used humanist versions of Aristotelian and Ciceronian political terminology. Yet, while it seems clear that fifteenth-century humanists developed issues and theories inherited from earlier literature and re-elaborated them in terms of new concrete historical circumstances, it is also true that their appeal to civic consciousness and their quest for liberty represented a break with prevailing patterns. The claim that the intellectual history and life of the early Renaissance had been characterized by dramatic transformation and lasting changes with respect to the late Middle Ages was advanced by Hans Baron in his seminal work *The Crisis of the Early Renaissance* (1955). According to Baron’s well-known thesis, the most original contribution of the age to modern political thought was the advent of what he called “civic humanism” – that is, a new emphasis

on the civic participation in the government and the life of the city as a necessary condition for human fulfillment, which in turn prompted a strong defense of those republican liberties inherited from the communal age. It was no coincidence, according to Baron, that the cradle of this “revolution of mind” was Renaissance Florence. As a counterpart to the emerging unity of England, France, and Spain, the *signori* Visconti of Milan, by conquering the two foremost north-eastern territories – Verona and Padua – tried to create a centralized region state in northern Italy in the early 1400s. Such an attempt provoked the resistance of the surviving city-states, among them Florence and Venice, and minor tyrannies, which promptly reacted against the rapid advance of the Viscontean rule (Baron 1955, 1966). Thus, the military crisis of early Quattrocento played a decisive role in the development of moral and political topics committed to both civic ideals and educational concerns, which eventually affected the outlook of intellectuals and governing elite throughout Italy and Europe. Finally, some historians had even argued that by challenging absolutist political thought, Florentine republicanism prepared the ground for the spreading of more democratic values, which in turn inspired the French and American revolutions of the eighteenth century.

Baron’s speculations regarding civic humanist ideology have been criticized on various grounds and revised by major scholars (e.g., Kristeller, Rubinstein, Fubini, Grafton, Skinner, and Hankins), no doubt justly in many respects. Yet, most of the political literature of the fifteenth century undeniably displays an appeal to the values of civic freedom, the characteristics of which may be especially detected in the works of the great chancellors of the Florentine Republic, Coluccio Salutati (1331–1406) and Leonardo Bruni (1370/5–1444). In defending Florence against his literary opponent Antonio Loschi, the supporter of Milanese despotism, Salutati proclaims the virtues of *florentina libertas* and the superiority of republican freedom over monarchy. Similar arguments occurred a few years later in the political writings of Salutati’s pupil Leonardo Bruni, particularly in his *Laudatio florentinae*

urbis (*Panegyric of the City of Florence*), composed in 1403–4 during Florence’s successful defense of its liberty against Milan, a text that has been regarded as the humanist celebration of the “popular” constitution. Strongly influenced by both Francesco Petrarca (1304–1374) and fourteenth-century chroniclers and jurists such as Giovanni Villani (c. 1280–1348) and Bartolus of Sassoferrato, Bruni asserted the independence and authority of the Florentine republic, the legitimacy of which derived directly from the Roman republic. He also stressed the connection between freedom to participate in politics and equality of the citizens before the law (Bruni 1968). Almost twenty-five years later, in the *Oratio in funere Nannis Strozze* (*Oration for the funeral of Nanni Strozzi*), his praise for the Florentine republican form of government is accompanied by a justification of Florence’s “imperialistic” policies in Tuscany. This attitude, together with some oligarchic stances informing Bruni’s and Salutati’s historical and political judgments, has led some historians to read civic humanists primarily as rhetoricians devoted to producing propaganda for the state (Hankins 2010, 2014). This aspect clearly emerges in the advice-books, a literary genre that goes back to the republican context of the thirteenth century – initially addressing the figure of the *podestà* – and continued to flourish in the middle decades of Quattrocento down to the Cinquecento in the form of educational treatises for rulers and those they ruled. After the failure of republican institutions in Italy and the introduction of hereditary rule at the turn of the fourteenth and fifteenth centuries, several humanists had composed books of advice intended for *signori* and princes, the aim being to supply them with useful and practical instructions about the conduct of their affairs, while celebrating the excellence of their government. These are, obviously, rhetorical texts, and the very favorable attitude they display towards this or that *signore* evidently does not constitute evidence of a particular political orientation on their author’s part. A striking example is Pier Paolo Vergerio the Elder (1370–1444), who in his early works showed republican commitments, while later in his life he expressed admiration for monarchy and the mixed constitution of

the Republic of Venice alike. Far from overtly vindicating royal or popular rule, Vergerio's principal concern seems to be a government ruled by a legitimate and virtuous prince capable of ensuring peace and justice. Equally, Bruni's and Salutati's apparent inconsistency in their political commitments may be explained by an adaptation of their thought to the changing political setting. Such a prudential and relativistic attitude also persisted in sixteenth-century humanists. Their main goal was the cultivation of ethical governance, whether in a kingdom, oligarchy, or republic (Hankins 1995, 2000, 2014).

The idea that the given constitutional form of a polity was less important than the virtue of its ruler – undoubtedly of Aristotelian (but also biblical) origin – was also recurrent in the political writings of most Italian humanist theorists of the second half of the Quattrocento. Although it has long been studied under the shadow of Machiavelli's political thought, political humanism is not inferior to it in terms of originality and theoretical insight. One of its main commitments lay not so much in discussion of the best form of government, as in the establishment of the policies necessary for the management of a specific form of government, that is, a princely regime. Like their predecessors, the late humanists did not think that good government was necessarily incompatible with a one-man rule, which by that time had been superseded in almost all republican institutions. Thus, Francesco Patrizi of Siena (1413–1494), Bartolomeo Sacchi (1421–1481), Diomedes Carafa (1407–1487), and Giovanni Pontano (1429–1503) all produced works belonging to the so-called mirrors-for-princes treatises, devoted to emphasizing the virtues a good ruler should possess. Such literature adapted the political language of the medieval advice-books to make it fit new historical and political conditions, thus providing a pragmatic response to diminished opportunities for civic participation. Francesco Patrizi's two major treatises, the *De institutione reipublicae* (*How to Found a Republic*), probably written in the 1460s, and the *De institutione regni et regis* (*On Kingship and Royal Education*), composed between 1481 and 1484, were regarded as the standard humanist

portraits of the good citizen and the good king as the foundation of justice and the embodiment of virtues (Viroli 1992). But perhaps the most original text of this kind is Pontano's *De principe* (*The Prince*), presented to Ferrante of Aragon, king of Naples in 1468 and published in 1490. By presenting the virtuous ruler as the *speculum* or *exemplum* for judging all the actions of the subjects, Pontano's analysis appears to be grounded in the "organic analogy," that is, the idea of a well-ordered *corpus politicus* in which each component naturally performs a specific function under the rule of one. It is therefore the exercise of virtue that legitimates and guarantees the hierarchical structure of power. In this way, humanist political thought became refocused on the definition of a new cohesion to replace the one that, after two centuries of disruptive struggles, had been lost, thereby giving rise to a social and political body based on *ethos* and rationality (Cappelli 2012).

The humanist emphasis on the ideal of virtue leading to perfect life, achievable through education, had a twofold effect on the political literature well into the sixteenth century. On the one side, it produced several works focusing on the right kind of upbringing and instruction for both perfect courtiers and princes to attain and practice virtue, wisdom, and prudence. Hence, parallel to the mirrors-for-princes literature, an increasing number of courtier handbooks developed, such as Diomedes Carafa's *Dell'optimo cortesano* (*The Perfect Courtier*), written while its author was in service at the Neapolitan court in the 1480s, and Baldassarre Castiglione's *Il libro del cortegiano* (*The Book of the Courtier*), first published in 1528, which became one of the most admired products of the Italian Renaissance. Although the work has often been read apolitically, either as a manual for the personal education of gentlemen or as a guide to the fully realized human life, it nevertheless displays a potential civic aim. By making his prince a better person, and thereby a better ruler, the capable and virtuous courtier takes the opportunity to be actively involved in the political life of the city, a prospect that by the time of Castiglione's writing of the book had all but disappeared (Lovett 2012). Such a renewed form of civic ethics also survived in several

political and moral treatises of the late sixteenth century, such as Giovanni Della Casa's courtesy book entitled *Galateo* (1558) and Stefano Guazzo's *Civil conversazione* (*Civil Conversation*, 1574). On the other hand, the humanists' conception of the good life had a concrete realization in the beautiful and perfect settings of the architectural treatises of the Renaissance. Leonardo Bruni's description of Florence as a perfect city, which is "admirable both in her exploits abroad, and in her internal order and institutions" (*Laudatio*, p. 232), displays motifs that became standard in the utopian writings of the sixteenth century from Thomas More's *Utopia* (1516) to Tommaso Campanella's *La città del Sole* (*The City of the Sun*, 1602). The image of the city as a rational, planned space, whose external beauty and internal order had a great impact on its inhabitants, prompted debate about what a good place or social context should be. Perfect symmetry and harmony inform the planning and the building of the ideal town imagined in *De re aedificatoria* (*On the Art of Building*), written by Leon Battista Alberti (1404–1472) around 1450, thus reflecting the natural order as envisaged in the Platonic republic. Equally, in the fourth book of the early treatise *Della famiglia* (*On the Family*, 1433/1434), he depicts the "good" household management as well as the perfect life of the virtuous man who rules it. The same ideal setting inspired Matteo Palmieri (1406–1475), a disciple of Bruni, who in his dialogue *Della vita civile* (*The Civic Life*) discussed the principles of the good life and depicted the republic as an extended patrician family dominated by a paternal rule over women and children. Clearly influenced by the leading members of Salutati's circle, among them Pier Paolo Vergerio, Poggio Bracciolini (1380–1459), and Alberti, Palmieri's work is devoted to outlining the duties of the perfect citizen for the sake of the whole city. The link between treatises on good government and utopian works is also exemplified in the literary output of Anton Francesco Doni (1513–1574), which betrays the influence of Desiderius Erasmus (1466–1536) and Thomas More (1477/8–1535). In *I mondi* (c. 1552–1553), probably his most successful and best-known work, the description

of the ideal city, perfectly built according to geometrical regularity, referred to a Platonically orientated vision towards a society regulated by absolute morality, not subject to the instability of the age. At the same time, Doni's new world is characterized by both social and economic equality as the indispensable requirements to achieve happiness and peace, a regimented way of life which is a typical feature of the genre of Renaissance utopia. The sense of a harmonious, balanced, and ordered State transcended precise questions of constitutional configuration and permeated Renaissance political culture in general. Two other Italian utopias followed in the second half of the sixteenth century, *La città felice* (*The Happy City*, 1553) written by the philosopher Francesco Patrizi da Cherso (1529–1597) and *La repubblica immaginaria* (*The Imaginary Republic*), written by Ludovico Agostini (1535–1612) between 1575 and 1580, although unpublished until the twentieth century. Both these works share the essential idea that man can only thrive if he lives in a virtuous society.

Throughout the fifteenth and mid-sixteenth centuries, the so-called "northern humanism" established itself in Europe as an intellectual phenomenon. The impact of the Italian Renaissance upon the political thought of the northern humanists is manifest in their writings (Skinner 1978). Nevertheless, by analyzing the specific background and context in which northern humanism proliferated, a distinct turn from its ideological matrix may be detected. When the Renaissance began in the mid-fourteenth century in Italy, the mixed political system known as the Holy Roman Empire was constantly threatened by religious divisions and internal conflicts. Moreover, the huge impact of the fiscal pressure of Rome on the imperial church prompted the grievances of the "German nation" against the corruption of the church and papacy. Inability to secure internal peace, coupled with the French and Ottoman threats, induced an urge to reform. As a result, throughout the fifteenth-century Latin and German-language treatises offered proposals for administrative, judicial, and constitutional measures. As for political writings, they combined arguments about the importance of the *studia*

humanitatis in educating citizens, political propaganda, and instructions for good government. Humanist learning, with its revival of Tacitus's *Germania*, also contributed to the growing sense of national identity. However, at the end of the century, the Holy Roman Empire entered a period of institutional growth and increased political importance, with the birth of effective imperial institutions, among them its parliament (the Imperial Diet) as one prominent result. Following the 1512 Diet of Cologne under Maximilian I's rule, the name "Holy Roman Empire of the German Nation" became the official title of the Empire. Not only did this term present the empire as an equal heir to the legacy of the "Holy Roman Church," but it also challenged and limited claims on the Empire from French rulers such as Francis I, who campaigned for election to the imperial throne in 1519. At the same time, the spread of evangelical ideas and the quest for church reforms helped to strengthen the link between German humanists and the Reformation. In 1520, the Augustinian friar Martin Luther (1483–1546) published his important treatise, the *Address to the Christian Nobility of the German Nation*, in which, by urging civil magistrates to take up their responsibility to reform the church, he deliberately followed the tradition of German grievances against Rome. Three further works followed – *The Freedom of the Christian*, *The Babylonian Captivity of the Church*, and *On the Papacy at Rome* – in which Luther strongly attacked both the temporal power of the Church and its authority to direct and guide Christian life (Eire 2016). Luther's refusal to recant his teachings prompted the Edict of Worms (1521), which threatened his supporters with papal condemnation and an imperial ban prohibiting his writings. Ten years later, in his *Warning to His Dear German People*, Luther sustained the right of the subjects to resist when the king or the supreme magistrate commands something contrary to the faith. The topic was also addressed by the Wittenberg reformer Philipp Melancthon (1497–1560), the most prominent intellectual among Luther's early disciples. By analyzing the status of the law of nature and its congruence with civil laws, he developed an account of political authority aimed

at counteracting Ockhamist tendencies to legitimize rebellion. His arguments echoed Luther's doctrine of nonresistance, which by contrast had a strong theological basis (Jensen 2020). These events led to a shift in the focus of political thought, from an emphasis on religious commitment and political obedience to the role of the emperor and empire (R. Von Friedeburg and M.J. Seidler in Lloyd-Burgess-Hodson 2007). Building on both Luther and Melancthon, the jurist Johannes Oldendorp (1486–1567) developed an original theory of equity and equitable lawmaking and law enforcement as part of a broader biblically based theory of natural law. All these writers laid the foundations for a new legal, political, and social trend that dominated Lutheran Germany for the next three centuries (Strohm 2017). Concomitantly, Lutheran ideas about resistance achieved immediate and widespread impact in England, Scotland, and Switzerland as envisaged in the writings of John Ponet (c. 1514–1556), John Knox (c. 1514–1572), and Jean Calvin (1509–1564). Such literature had been further developed in France by Calvin's disciple Theodore Beza (1519–1605), who in 1574 wrote the *De iure magistratuum* (*On the Rights of Magistrates*), and by the anonymous *Vindiciae contra tyrannos*, first published under the pseudonym of Stephanus Junius Brutus in 1579. Resistance theory also became important for the justification of the Dutch Revolt (1548–1648) and influenced Hugo Grotius's natural law theories.

Due to its geographical location, France cast itself as a zone of convergence and of dissemination of ideas from all parts of the continent. By the end of the fifteenth century, the University of Paris, one of the leading centers of university education in northern Europe, had produced a great number of professional officeholders who had been trained in both civil and canon law (*utrumque ius*). The most distinguished of these were the magistrates of the "parlements" (law courts) and the French higher clergy leading the faculty of theology (J.H.M. Salmon in Lloyd-Burgess-Hodson 2007). Moreover, the commitment of France's prominent scholars to Gallicanism together with the influence of European

humanists largely informed later French political thought. Although a nationalistic spirit began to emerge during the Hundred Years' War against England (1337–1453), its basis had been laid almost two centuries earlier by Gallican writers who claimed the non-Roman origins of French political and religious authority, while emphasizing the autonomy of the French church against the powers of both king and pope. At the beginning of Quattrocento, the conciliarist movement asserting the power of a general council to discipline and depose a pope became the leading political ideology of the French Church (Oakley 2003). Such ideas were forcefully developed in several political writings, such as the *Tractatus de ecclesia* (*Tract on the Church*) and *De potestate ecclesiastica* (*On Ecclesiastical Power*), written respectively in 1416 and 1417 by Pierre d'Ailly (1351–1420) and his pupil Jean Charlier de Gerson (1363–1429). Their attacks on the absolute powers of the pope were also taken up by radical anti-monarchical authors, who read Gerson's arguments in terms of the deposition of kings as well as popes. Drawing on Marsilius of Padua, they claimed the right of the community to change both its ruler and form of the constitution with reasonable cause. A challenge to this view is represented by the constitutional theory advanced by the jurist, diplomat, and propagandist Claude de Seyssel (c. 1450–1520), who, in the spring of 1515, wrote *La grant monarchie de France* (*The Great Monarchy of France*), which is considered one of the best examples of European juridical-political literature of the sixteenth century. In this work, which provided a systematic discussion of the emerging French state almost 50 years before Bodin's *Les Six Livres de la République* (1576), Seyssel held that the power wielded by the monarch was both controlled and balanced, being restricted by religion, justice, and laws. Distancing himself from Machiavelli, who had emphasized the ability of a ruler to cause the State to grow, Seyssel points to good administrative order and the loyalty of the people as a prerequisite to expansion (Boone 2007). By contrast, the development of the French legal tradition (*mos gallicus*), together with the reception of Italian humanist advice-books on good government,

constituted the background of Guillaume Budé's *Institution du Prince* (*The Education of the Prince*), a compilation of anecdotes or *apophthegmata* on political governance, composed most likely in 1519 for Francis I. His innovation as a political theorist lies in his legitimating absolute power on humanist grounds, thus paving the way for more modern historicism at the end of the century (Kelley 1970). Arguments in support of royalist rights against papal authority figured conspicuously in sixteenth-century authors, among them the jurist Charles Dumoulin (1500–1566), who in his programmatic treatise on the French monarchy (*Traité de l'origine, progrès, excellence du Royaume et Monarchie des François et couronne de France*, 1561) affirmed the freedom of the secular monarchy from the jurisdiction of the universal church in temporal affairs. His antipapal stance came about through his acquaintance with Lutheran and Calvinist ideas about the roles of church and State (Kelley 1970). Emulating Luther's teaching on the two kingdoms and two governments, John Calvin in both the early and the late editions of the *Institutes of the Christian Religion* (1536 and 1559) had affirmed a clear distinction between a heavenly, spiritual kingdom that finds its expression in the church, and a civil, earthly kingdom whose institutional expression is the civil government. Yet, despite all his ambiguities, he departed from Luther's outlook and articulated a different political theology – one that would influence the theories of later Calvinist writers, thus providing an intellectual basis for the more radical kind of Protestantism that emerged in the second half of the sixteenth century (Fergusson 2010; Eire 2016).

Spanish political thought was undoubtedly influenced by both Italian humanism and Erasmus's program of ecclesiastical reform. Erasmus's topics, such as biblical study, education, peace in Europe, and civil concord, later surfaced in the works of Juan Luis Vives (1493–1540), the great Iberian humanist who studied at Paris, Bruges, and Louvain and taught at Oxford. Yet, unlike in the great northern monarchies, Protestantism never gained a strong foothold in Spain. Instead, one of the crucial questions involved the

legitimacy of the Spanish presence in America and the nature and rights of the natives, points that inevitably affected the political debates of the time. Several pamphlets were produced in order to demonstrate that the conquests had satisfied the requisites of just war, thereby casting the emperor as a universal monarch. Concomitantly, the atrocities committed by the colonizers on the Amerindians, the practice of selling them as slaves, and the means of evangelization aroused criticism. In 1515, the Dominican friar Bartolomé de Las Casas (c. 1484–1576), invoking a universal conception of human dignity, openly advocated the rights of the natives before King Charles V. The issue was definitively addressed after two of the most dramatic campaigns in the Spanish colonization of the Americas, that is, Hernán Cortés's conquest of Mexico in 1520 and Francisco Pizarro's expedition against the Incas in 1533 (McAlister 1985; Tellkamp 2020). Las Casas's most famous work, *A Short Account of the Destruction of the Indies*, written in 1542 and published ten years later, is at the same time a condemnation of the Spanish methods of colonization and a defense of the genuine meaning of Christian evangelization. His arguments were opposed by Juan Ginés de Sepúlveda (1490–1573), a humanist who in his *Democrates alter sive de justis belli causis apud Indos dialogus* (*The second Democrates, Concerning the Just Causes of the War Against the Indians*, 1545) endorsed Aristotle's notion of "natural slavery" to justify wars of enslavements and the legitimacy of Spanish imperialism. In the same years, Francisco de Vitoria (c. 1486–1546) and Domingo de Soto (1494–1560), both professors of theology at Salamanca, firmly denied the legitimacy of arguments justifying the conquest of the Indies as well as questioning the pope's right to give European rulers dominion over primitive peoples. Furthermore, in his 1539 lecture on the Indies, *De iure belli* (*The Law of War*) Vitoria placed extraordinary constraints on the right to wage war, while underlying the role of natural law as a rational norm through which men can merge any kind of conflict and issue (Losada 1971; Scattola 2009; Beneyto-Corti Varela 2017). Broadly recognized as one of the "fathers

of international law", his theories influenced later great European thinkers, such as Alberico Gentili (1552–1608), Hugo Grotius (1583–1645), John Locke (1632–1704), and Samuel Pufendorf (1632–1694) (García and García 1997).

The reception of humanist ideas together with the religious issues brought up by the Reformation began to take root in England by the start of the sixteenth century. Nevertheless, the propagation of the *studia humanitatis* had already been promoted by several Italian scholars who went to teach at Cambridge and Oxford in the late fifteenth century. Until then, English writers had based their political questions on a range of sources largely drawn from key topics of medieval political thought, such as royal authority and community rights. Sir John Fortescue (c. 1394–1476) had turned to Thomas Aquinas's and Ptolemy of Lucca's ideas to elaborate his theory of the "political and regal king," that is a king who protected property and served the public good. The same concern with virtuous government and the good of the community as a whole was further developed in educational treatises and in English advice-books, which had similar characteristics to those produced in France, Spain, and Italy (M. Van Gelderen in Lloyd-Burgess-Hodson 2007). However, the unquestionably most famous exploration of "the best state of a commonwealth" was Thomas More's *Utopia*, the description of a republic ruled by excellent laws in which everyone lived in perfect peace and happiness while working for the common good. If it is true that *Utopia* reflects More's criticism and distaste for the corruption of his times, nevertheless, it represents his attempt at providing an alternative model of society combining private virtue and political life. As a reply to his close friend Erasmus, who in 1509 had dedicated to him the *Moriae encomium* (*The Praise of Folly*), More's *Utopia* embodies the author's demand for political and social reform. The same need for moral reform in order to promote the "commonwealth," or "public weal," informed the works of contemporary "radical" humanists and Protestant authors, such as Thomas Elyot (1490–1546), Thomas Starkey (1495–1538), and Sir Thomas Smith (1513–1577), whose works would become a

source of inspiration for Jean Bodin, Thomas Hobbes, and John Locke. Yet, the most influential advice-book of northern humanism was Erasmus's *Institutio principis christiani* (*The Education of a Christian Prince*), addressed to the future Emperor Charles V in 1516. The *Institutio*, which has been often seen as the counterpart of More's *Utopia*, combines the humanist ideal of the virtuous prince with the reformist hope for the moral betterment of the body politic. Despite his criticism of Catholic institutions and practices, Erasmus refused to endorse the radical methods of the reformers and strongly opposed Luther's destruction of unity within the Christian Church. Rather, he sought to accomplish the reform of both the church and the State through the power and development of *humanae litterae*. By covertly questioning the universal monarchy and the futility of dynastic wars, he warned against the traditional concepts of glory and honor reshaping them in the spirit of the Christian and classical virtues. A father figure to his people, the Christian prince must dispense justice and provide spiritual leadership. Thus, in exercising his power, he is subject to the law and assumes as many responsibilities as honors. Provided he promotes the public good and not his self-interest, the prince can be regarded as the likeness of God (*imago Dei*) in his manners and qualities and, in turn, as the example to be imitated by all of his people. As a such, by his wisdom, he must prevent war, which usually arises from private reasons and interests (Tracy 1978; Trapman et al. 2010). Erasmus's disapproval of the warlike policy of his age is clearly expressed in the expounded version of his most famous proverb *Dulce bellum inexpertis* (*War is sweet to those who have not tried it*, 1515), in the *Enchiridion militis christiani* (*Handbook of a Christian Knight*, 1503/4) as well as in the *Querela pacis* (*Complaint of Peace*), which appeared in 1517, just as Charles V declared war on Francis I of France. In these works, the Dutch humanist discussed the unnatural state of war and vividly illustrates how the prosperity and good order of society, as well as the advancement of the arts, sciences, and education, are all the fruitful results of peace. Finally, by rejecting any kind of enforced conversion of faith, Erasmus offered his

own contribution to the doctrinal debate over "just war" culminating in the Valladolid dispute between Las Casas and Sepúlveda in 1550–1551 (Losada 1971; Tellkamp 2020).

The primacy of virtue as articulated by Erasmus was a standard tenet in humanist political thought inasmuch as it offered a new form of legitimation to the prince's rule: not only was virtue a personal distinction, but it also was a necessary and sufficient title for the exercise of power (Hankins 2014). This argument was challenged and overturned by Niccolò Machiavelli (1469–1527), who offered in his *Il principe* (*The Prince*), completed roughly at the same time as Erasmus's *Institutio* came off the press, an alternative approach to politics developed by his humanist predecessors. Unlike them, Machiavelli's political theory was based on a redefinition of virtue as whatever human quality, moral or immoral, good or bad, made for effective political power (Skinner 1978; Quagliani 2007; Hankins 2014). This implies the prince's free choice to depart from traditional morality for the preservation of the State, if necessary. As such, Machiavelli's *virtù* is less related to the individual qualities of the ruler than to the success of his actions and, therefore it is concerned with public affairs rather than with private relationships. His aim to avoid consideration of imagined matters and examine instead the reality of political affairs (*verità effettuale*) marked a clear methodological shift from the traditional model of mirrors-for-princes literature. Several scholars have argued that the fundamental differences between Machiavelli and his humanist predecessors reflect the different political conditions of Florence in his days (Sasso 1980; Rubinstein 1982; Cappelli 2017). The events following the French invasion of 1494, in which Italy became the arena of the violent battle for supremacy between the Germanic Hapsburg and French Valois dynasties, as well as the restoration of the Medici regime in Florence in 1512, had a traumatic effect on Florentine political thinking. The instability and uncertainty of things to which Machiavelli constantly refers in his writings, according to this line of interpretation, are in fact more than a vivid picture of the current turmoil he and his

contemporaries faced. In such a desperate context, the role of virtue becomes crucial for actively overcoming the challenges of arbitrary, capricious fortune, thereby involving the ruler's ability to adapt to mutable circumstances and to prepare, in times of peace, for a sudden change. Machiavelli's analysis is also an attempt to provide a remedy to the moral degeneration and political decline of republican liberty. Because of the wicked nature of human ambitions, the monarchical regime appears at first glance as the only effective government to control and restrain people's excessive ambition and corruption (see ► ["State in Renaissance Politics"](#)). Nevertheless, in the *Discorsi sopra la prima deca di Tito Livio* (*Discourses on Livy*), Machiavelli set about defining republican liberty and establishing the conditions of how it might best be achieved and preserved. In the first 18 chapters of the work, which had been probably developed out on an early treatise on republics datable 1513/1515, he outlined the framework of the conditions that make possible the "vivere politico," that is, the specific political regime or constitution which precludes tyranny and despotic rule through the rule of law and the safeguarding of the common weal (Pocock 1975; Viroli 1992). Indeed, in the second book of the *Discourses*, Machiavelli seems to express a clear preference for free or republican government inasmuch as "it is not the particular good but the common good that makes cities great. And without doubt this common good is not observed except in republics" (*Discourses*, II, 2, in Machiavelli 2000). More specifically, the Roman Republic is regarded as a positive example with regard to the benefits deriving from the political struggle between the various "humors" that compose every political body. In this respect, his renowned and scandalous thesis that "the disunion between the plebs and the Roman senate made that republic free and powerful" (*Discourses*, I, 4, ed. cit.) paved the way for the long history of conflictualism in western political thought (Pedullà 2018). Furthermore, although Machiavelli regarded religion as the chief of three essential bases upon which any political society is grounded – the other two being laws and military discipline – his critique of the papacy and of the

Roman Church Christianity as expressed in the *Discourses* parallels the line of reasoning of the last chapter of *The Prince*. More specifically, it is the Church that "has kept and still keeps Italy divided" (*Discourses*, I, 12, ed. cit.) and is thus the cause of the loss of republican liberty. Similar criticism of the Church emerges in the *Istorie fiorentine* (*History of Florence*), commissioned by Pope Leo X in 1520 and first published in 1532; there Machiavelli highlighted the dreadful effect of sectarianism within Christianity over the centuries. Yet, in the same year (1520) Machiavelli expounded to Pope Leo X and Cardinal Giulio de' Medici (the future Pope Clement VII) a plan for constitutional reform to restore Florence to a "well-ordered republic" following the death of Lorenzo de' Medici the younger. The *Discursus florentinarum rerum post mortem iunioris Laurentii Medices* (written between November 1520 and February 1521) attempts to reconcile two contradictory needs: to give Florence the institutional structure of a "perfect republic" in which peace, prosperity, and harmony are guaranteed, and to grant the Medici absolute power.

The same concern with the political reform of Florence had been expressed by Machiavelli's friend Francesco Guicciardini (1483–1540) in his treatises on constitutional problems, the 1512 discourse *Del modo di ordinare il governo popolare*, also known as the *Discorso di Logrogno*, and the *Dialogo del Reggimento di Firenze* (*Dialogue on the Government of Florence*), composed between 1521 and 1525. In analyzing the corruption of Florence's institutions and customs, Guicciardini tried to persuade his fellow citizens to reshape their public life through virtue and good deeds. Four years later he wrote an essay to advise the Medici about how to preserve and reinforce their dominion over the city. Yet, in the *Dialogo del Reggimento*, Guicciardini reiterated his commitment to the republican ideal. As in Machiavelli's contemporary *Discursus florentinarum*, the regime he proposed for the city was, in fact, a mixed constitution, i.e., a regime combining elements of different constitutional forms, such as monarchy with aristocracy or democracy. While, however, Machiavelli looked

back to the Roman republic, Guicciardini took as his model the Venetian government, inasmuch as “all the different types of government go to make it up” (*Dialogo del Reggimento*, in Guicciardini 1974, p. 139). Such a wavering attitude perfectly matched one of the key ideas of his thought, namely that “general rules” cannot be applied to politics inasmuch as each situation is characterized by a specific set of circumstances (Rubinstein 2012). Along these lines, Guicciardini’s shift from a republican to a non-republican language of politics appears to be permeated by the same pragmatism that characterized Machiavelli’s thought. For this reason, both authors have long been regarded as the initiators of a tradition of political thinking grounded on the reason of state rather than on the art of politics (Viroli 1992). The controversial phrase *ragione degli stati* (“reasons of the states”) in fact, is never used by Machiavelli. Rather, it appears in Guicciardini’s *Dialogue*, where he claimed that in international affairs rulers must be prepared to violate divine-natural law if the reason of states requires it, thus displaying a cynical perspective that considered the theoretical treatment of politics pointless because of the imperfection and corruption of men. Such ideas were destined to mold the new intellectual and political world marked by the advent of Counter-Reformation and the revival of absolutist theories (see ► [“State in Renaissance Politics”](#) and ► [“Reason of State, Renaissance Concept of”](#)).

Impact and Legacy

The separation of political rationality from traditional morality marked the beginning of a new political position in Renaissance humanism. Around the mid-sixteenth century, Machiavelli and the idea of reason of state made their appearance in political literature and rapidly placed Italy at the center of European political theorists. Yet, whether they attacked him or tried to ignore him, they could not escape their debt to Machiavelli. Although his works had received Pope Clement’s approval at the time of their publication in the winter of 1531–2, Machiavelli was

shortly to be considered a dangerous author, and the term “Machiavellism” came to denote practical politics combining utilitarian and immoral actions for the sake of seizing and maintaining power. Writings against Machiavelli by Protestants and Catholics, who equally deplored the separation of politics and morality grounded on religion as allegedly expressed in his books, became popular throughout Europe, particularly in England and France. Furthermore, Machiavelli’s and Guicciardini’s challenge to the theories of natural law and the pope’s indirect power in temporal affairs raised objections not only from the theologians of the so-called School of Salamanca but also from the most notable leaders of the Catholic Reformation, such as the English Cardinal Reginald Pole (1500–1558), the Portuguese bishop Girolamo Osorio (1506–1580) and the Italian Jesuit Roberto Bellarmino (1542–1621), who even advocated the pope’s right to depose wicked monarchs. In opposing Machiavellian views, they also shared anti-absolutist feelings (Birely 1990).

The role of law and its relationship with religion and morality became a fundamental issue in sixteenth-century European political thought. A notable example was the influential book *Les Six Livres de la République* (*Six Books on the Commonwealth*) by Jean Bodin (1529–1596), originally written and published in French in 1576 and later accessible in a revised and expanded Latin version in 1586. Bodin’s account of sovereignty is perhaps the major event in the development of European juridical-political thought and became the prototype for a whole new literary genre in the seventeenth century. Although it had been considered the typical product of the sixteenth-century political climate, the *République* was undeniably indebted to the juridical culture of the medieval era as well as to the political humanist tradition. Indeed, the language adopted in describing the power of princes, the prudence and the virtues they must possess, as well as the notion of “sovereignty” and the questioning of mixed constitution as described by Bodin display a knowledge of both the vocabulary of the Italian theorists, such as Bartolus of Sassoferrato and Baldo degli Ubaldi, and the legal

status of Italian regimes in the late Renaissance. In fact, his other main works, including the *Methodus ad facilem historiarum cognitionem* (*Method for the Easy Knowledge of History*, 1566), the *Colloquium heptaplomeres* (*Colloquium of the Seven*, 1587) as well as the *Theatrum universae naturae* (1596) have their roots in the Platonic-Aristotelian tradition of Renaissance philosophical thought (Vasoli 2008). Yet, Bodin's doctrine also had a specific and a general significance in relation to the religious crisis of his day, reaching its climax in the religious wars between 1562 and 1598. Such events led, in turn, to a rethinking of the concept of *religio*, which, in Bodin's view, is the essential civic bond without which no political community can exist. This issue had a great impact on the coming generation of writers on reason of state, whose main concern was the relationship between secular power and religious and moral concerns (De Mattei 1979; Borrelli 1994).

A striking effort to reconcile the practices of princely government and Christian morality was made by reason-of-state authors, who harked back to the ancient historian Tacitus and his works to covertly promote Machiavelli's teachings. As a result, between the end of the sixteenth and the first half of the seventeenth centuries commentaries on Tacitus paralleled the reason-of-state literature. In this field, the jurist Domenico Ferretti (1489–1552), author of a critical edition of the *Annals* (1542), as well as the erudite humanists Marc-Antoine Muret (1526–1585) and Justus Lipsius (1547–1606) made important contributions to the rise and spread of "Tacitism" in Italy and Europe. Still, it was the Italian preacher Giovanni Botero (1544–1617) who, in the first chapter of his famous book *Ragion di Stato* (*On Reason of State*, 1589), gave a definition of "reason of State" as essentially the knowledge of the means for the preservation of the state, thus making an effort to conciliate it with the Christian religion. This reason of state, neutral in itself, was aimed at the public good and allegedly operated in conformity with Christian values. Despite

the ambiguity of Botero's arguments, the "reason of State" he outlined was a practical set of moral and political rules of conduct enabling the prince to preserve his dominion, while avoiding anything that might affect the stability of the State. Three years later, in a tract on the same subject (*On Reason of State*), published in his 1590 political work *L'idea del libro de' governi di Stato et di guerra*, Girolamo Frachetta (1558–1619) distinguished between true and false reason of state, that is, civil prudence and the pursuit of personal interest, respectively. While true reason is separated from neither moral virtue nor religion, false reason is concerned only with self-advantage, with no consideration of God and duty. According to this view, the state of reason must always be subordinate to human laws and religion, not otherwise (Baldini 1996, 1997). By contrast, at the very end of the century, Scipione Ammirato (1531–1601), in his *Discorsi sopra Cornelio Tacito* (*Discourses on Cornelius Tacitus*, 1594), took this idea further: invoking Tacitus to reject Machiavelli's republicanism, he stated that reason of state might occasionally involve breaches of the law, thus displaying the tendency of the time to put political science at the service of established power. As a result, theorists of reason of state detached political thinking from the natural law tradition and steered it toward Hobbes's views on absolute and indivisible sovereignty. This led to the transformation of politics from a matter of civic prudence to a science dealing with the principles of power, a shift that definitively took place at the turn of the seventeenth century (Scattola 2003).

Historians have also stressed the influential role that northern humanism played in the development of international law and "social contract" theories. More specifically, in distinguishing between the *lex naturalis*, the *ius gentium*, and the *lex positiva*, the neo-Thomists of Salamanca and the Jesuit theorists of the mid-Cinquecento anticipated issues and arguments that became central in seventeenth-century European political thought. Their speculations, later discussed

by Hugo Grotius and Samuel von Pufendorf, contributed to the establishment of a new political language that was fully adopted by their successors in order to build up a modern version of the natural-law theory of the state. Grotius's most famous work, *De iure bellum ac pacis* (*On the Law of War and Peace*), written in 1625, has been regarded as one of the most important classics of international thought. In this book, he elaborated his theory of man's sociability, that is, the capacity to form relationships that are "communitarian" in nature, a term that was developed later by Hobbes and other social contract theorists. Thus, in Grotius's civic philosophy, the commonwealth – or the unified body of citizens based on their free consent – was the basic unit of civil law and of all forms of authority (M. Van Gelderen in Lloyd-Burgess-Hodson 2007). Grotius's theory of sociability is also linked with irenicism. Formed in the Erasmian humanist tradition, he constantly advocated a church based on concord, peace, and unanimity. Yet, his modernity lay in his insistence on cooperation between Christians of different confessions in case of war. However, despite his devotion to peace, Grotius (or, for that matter, Erasmus) cannot be regarded as championing the principle of toleration as it is understood today. A brilliant and incisive defense of religious toleration would be published not until Pierre Bayle's *Commentaire philosophique* at the end of the century.

Poliziano, Agnolo

► [Poliziano, Angelo](#)

Poliziano, Angelo

Born: 14 July 1454, Montepulciano

Died: 28/29 September 1494, Florence

Francesco Caruso

Palermo, Italy

Abstract

Poliziano is commonly acknowledged as one of the most important European humanists of the fifteenth century and a key figure in the history of classical scholarship. In his activity as poet and scholar – or, as he called himself later in his life, *Grammaticus* – he widely read and studied the works of thinkers and philosophers, both classical and medieval. In what follows, attention will be paid especially to Poliziano as a reader, translator, and commentator of philosophically relevant texts. Despite of the obvious centrality of his literary accomplishments in his intellectual biography, they will be left in the background.

Alternate Names

[Poliziano, Agnolo](#); [Politianus, Angelus](#); [Politian](#)

Biography

Angelo Ambrogini was born in 1454 in Tuscany, in Montepulciano, *Mons Politianus*, after which he took his nickname. Very little is known about his childhood and early adulthood, which most certainly must have been darkened by the murder of his father, Benedetto. No later than 1469, we find him in Florence, hosted not too comfortably by his cousin Cino di Matteo Ambrogini. Around this time he enrolled at the Studio, the University of Florence. Once again, we are not well informed about this last stage of Poliziano's education, although it is certain that among his professors were Cristoforo Landino, Johannes Argyropoulos, and Andronicus Callistus. Landino, a Medicean bastion at the studio and a greatly influential teacher of poetics and rhetoric, was the advocate of a Neoplatonic allegoresis of literature, something on which Poliziano was never especially keen, in spite of his professed admiration for the older master. In Argyropoulos – who was among the most revered Byzantine emigrés to Italy after the fall of Constantinople in 1453 – Poliziano saw the model of the encyclopedic scholar, as well as the subtle commentator of Aristotle. Besides interpreting the “ethical” Aristotle, whose study was traditionally privileged on the Florentine rather conservative philosophical scene and by the intellectuals close to the local oligarchy, Argyropoulos introduced the study of the “logical” and “physical” Aristotle, conducted on the Greek original texts. Callistus succeeded Argyropoulos at the studio in 1471, and in the *Elegy to Bartolomeo Fonzio* (late 1473 or early 1474) Poliziano speaks of him as he who “solves the knots of obscure Aristotle” and “teaches the delightful poems of the inspired man from Smyrna [i.e. Homer]” (Bausi 2003, 35). The opposition between “obscure” Aristotle and pleasurable Homer reveals that around that time for Poliziano, the Greek philosopher was still an object of only mild fascination, whereas Homer (and classical literature in general) would always

be central to his interests. But in the *Elegy to Bartolomeo Fonzio*, with its narration of a typical day of a young humanist in the making, Poliziano fictitiously describes his encounters with other Florentine intellectuals, and there he devotes significant space to Marsilio Ficino, arguably the dominating cultural figure in Florence at that time. He portrays Ficino as a man who is highly competent in natural philosophy, medicine, astrology, and music and who “refutes the impious words of insane Lucretius and wages war against Epicurus’ errors” (Bausi 2003, 31). Poliziano seems to allude only in passing to Ficino’s achievements as a rediscoverer of Plato’s teachings and seems rather be praising the philosopher for possessing unique and awe-inspiring wisdom. At this stage, the relation between the two, among the most debated issues among Poliziano and Ficino scholars, is that of an enthusiastic pupil eager to learn and an established master who, with the publication of the letters and the poems documenting his discussion with Lorenzo de’ Medici on the Supreme Good (1474), will soon become something similar to the official philosopher of the Medici’s regime. Of the few extant letters exchanged between Poliziano and Ficino in these months, it is worth mentioning one that goes by the name of *Laus brevitatis* (I, 15 of Ficino’s epistolary), where Ficino boldly affirms: “in such brevity of time, to speak vainly is more of the philologist than of the philosopher” (Ficino 1576, 681). Whatever interpretation we want to give to this sentence, we can safely affirm that it anticipates the main reason why their respective paths will eventually part: Ficino viewed philosophy as an autonomous and superior discipline, while for Poliziano it was part of the classical “circle of learning” (*encyclopaedia*) to be investigated with the instruments of philology (*grammatica*).

At the time Poliziano enrolled at the studio (ca. 1469), his greatest concern was still that of securing a remunerated protection for himself and returning to the *dulce studium* always threatened by “envious poverty” (Del Lungo 1867, *Lat. Epigr.* 1). The late Benedetto Ambrogini had some ties with the Medici family, and this eventually favored his son’s early entrance into their

extended circle. Indeed, between 1472 and the late fall of 1473, Poliziano served as secretary to Agnolo della Stufa, a Florentine personality of adamantine Medicean faith. During this time, the inclusion of Poliziano’s uniquely learned elegy entitled *Epicedion in Albieram* (1473) in a collection of writings assembled in memory of Agnolo’s prematurely departed daughter in law, Albiera degli Albizi, marked the young poet’s thunderous entrance as one of the Florentine’s finest muses. By the end of that year, Poliziano was finally admitted into the Medici household. Already in 1470, he had successfully tried to win Lorenzo’s sympathy by presenting him with a translation in Latin verses of book II of the *Iliad*, eventually followed by that of book III (1472). It was an ambitious operation, as according to the humanists’ social code, this gift situated Poliziano in a two old intellectual line of succession: literary – that of Homer – as well as political – that of Carlo Marsuppini, humanist and Medici partisan, whose translation of the *Iliad*, interrupted by his death in 1453, was now being carried on by a practically unknown 15-year-old. Lavish praise came from Poliziano’s contemporaries, and Marsilio Ficino soon acknowledged him as “Homerus adolescens” (Branca 1983, 39).

Poliziano’s admission into the Medici family is arguably his life’s major turning point. From then until his death, he will live his life “under the laurel” that is according to that alliance of literary glory and power granted to him by the close connection with “Laurentius Medices,” head of the family of bankers since 1469. In the beginning, Poliziano served as secretary to Lorenzo but was soon appointed as preceptor of his two sons: the irresolute and inept Piero, a fulgid example of the “pedagogue’s impotence on chromosomes” (Cordero 1986, 263), and the more cold-headed Giovanni, the future Pope Leo X (1513–1521). Poliziano’s intimate relation with Lorenzo, cemented by deep intellectual affinities, also suffered multiple crises, most notably at the end of the 1470s, when he refused to accompany Lorenzo on a critical mission to Naples and fled to the Gonzaga’s court in Mantua (winter 1479–1480). In spite of these ups and downs, by

the summer of 1479, Lorenzo must have realized Poliziano's outstanding potential as a scholar. He was ready to channel them into what was termed "Laurentian cultural policy," a broad cultural project marked by an overarching classicistic stance, including the shaping of a new high-style canon in the Tuscan vernacular and the launching of classical scholarship in Florence and in its relatively recently founded university. Accordingly, in a handful of years, Lorenzo granted Poliziano a number of allowances, presenting him with a small farm near Fiesole and appointing him curator of the Medicean private library. To top it all off, in the summer of 1480, on Lorenzo's impulse, the officials at the studio designated Poliziano professor of rhetoric and poetics. On his part, on several occasions, Poliziano already demonstrated his literary ability by exploiting the contingent nature of an event and turning it into political value. First, he did it with the *Stanze per la giostra*, a poem in octaves in two books imbued with Neoplatonic references, celebrating the joust as a festive seal of the alliance of Florence with Milan, Venice, and Rome, glorifying Giuliano, the lesser but more glamorous of the Medicean *Dioscuri*, and winning the tournament in piazza Santa Croce in January 1475. But 3 years later and a few churches away, Giuliano lay dead in Santa Maria del Fiore, stabbed to death at 25 in the conspiracy plotted by the Pazzi family, the Medici's archenemies. Unlike the *Stanze* – whose composition was interrupted by the death of the people it was meant to celebrate and then left unfinished to be printed almost posthumously in 1494 – the *Pactianae coniurationis commentarium*, a pro-Medicean pamphlet reminiscent of the Roman historian Sallust and the only historical work Poliziano wrote, had a much larger echo among the contemporaries, as it was printed in the immediate aftermath of the conspiracy and was part and parcel of an extremely aggressive campaign of propaganda orchestrated by Lorenzo and his supporters against the conspirators and their political protectors.

During his tenure at the University of Florence, which lasted until his death in 1494, Poliziano lectured publicly and privately, to local as well as international students. He produced a

vast output of works, especially commentaries – most of which he meant for private use and consequently left unpublished – and introductory orations to his courses (*praelectiones*), often containing programmatic statements offering important glimpses of his esthetic and philosophical convictions. From a look at his notes, which range from Homer – whom he saw as the primordial "ocean" from which all classical wisdom originated – down to Theocritus, Cicero, Virgil, Ovid, Persius, and many others, it seems that no known classical or medieval author or work escaped his sharp eye. Poliziano's final goal was the encyclopedic and exact reconstruction, by means of language, of the whole thesaurus of antiquity, a task eased by his unparalleled command of Latin and Greek. In his own words: "the functions of philologists are such that they examine and explain in detail every category of writers – poets, historians, orators, philosophers, medical doctors, and jurisconsults" (Celenza 2010, 245). Therefore, his preference leaned not only toward the works of grammarians and the *lexica* but also toward those writers providing the most vivid accounts of what he called the "erudite centuries" and whose books were redolent with detailed descriptions and *Realien*, especially Pliny the Elder, Plutarch, and Aulus Gellius. The two "miscellanies" – the *Miscellanea Centuria prima* (1489) and *Secunda* (left unfinished and unknown until its eventful discovery in 1973) – are the quintessential product of this most fecund season of philological studies.

Although we do not have a complete or exact chronology of Poliziano's courses at the studio, it is certain that in the early 1490s, he began lecturing on philosophical works, particularly those by Aristotle. In the academic year 1490–1491, he publicly read books III and V of the *Nicomachean Ethics*, probably along with a private course on the *Physics*. The two semesters 1491–1492 were devoted to Aristotle's *Categories*, *On Interpretation*, and *On Sophistical Refutations* as well as to the works of some of his commentators, such as Porphyry's *Introduction* and (the spurious) Gilbert of Poitiers's *Liber de sex principiis*. In 1492 he taught the *Prior Analytics* and Cicero's *Tusculan Disputations*. In 1493, he completed Aristotle's *Organon*, teaching the

Posterior Analytics and the *Topics*. Poliziano's interest in Aristotle and Aristotelianism is by no means new; what is novel, however, is the almost exclusive scholarly focus on the great Greek philosopher, the decision to make him the primary object of lectures, and the systematic approach to studying the arts of speech. In Poliziano's own words, it was Giovanni Pico who revived his interest in philosophy: "[he] trained me to look at philosophy with eyes that were not sleepy, as they were before, but rather that were alive and awake, as if he were giving me life, with his voice serving as a kind of battle-trumpet" (*Ang. Polit.* 1553, 310). Poliziano and Pico met in 1479, but they became especially close after 1484, when Pico first established himself in Florence.

Pico was soon absorbed into Lorenzo de' Medici's sphere of influence, and in 1489 Poliziano could affirm that Pico had "made its nest in the laurel" (*picus* is in fact Latin for "woodpecker," while the "laurel" is obviously Lorenzo) (*Ang. Polit.* 1553, 217). And it was on Lorenzo's behalf, namely, to enrich his unique library, that, between June and July 1491, Poliziano and Pico traveled together in Northern Italy hunting for books, many of which dealt with Aristotelian philosophy. Their relation was one of mutual and nearly absolute admiration, and Poliziano must have certainly benefited from Pico's vast philosophical knowledge. This close friendship inevitably affected Poliziano's attitude toward Ficino, whose relationship with the younger, intellectually restless Pico oscillated between the two poles of disinterested generosity and thinly veiled criticism. The frictions affecting this triangle of thinkers became apparent when Pico dedicated his *De ente et uno* to Poliziano in 1491. In this work, which contained *in nuce* his attempt to reconcile the teachings of Plato and Aristotle, Pico implicitly rejects Ficino's tenet of the preparatory validity of Aristotle's teachings and of Plato's superiority in the pursuit of happiness, as the latter had written in a letter to Pico dated to 1482: "Peripatetics do not easily make us erudite, Platonists make us also wise and happy" (quoted by Sebastiano Gentile in Viti 1994, 128). In addition, Pico there argues that the soul's journey to God may take place by following diverse traditions of thought and that does not necessarily occur through the *Via Platonica*.

The fact that, in the introduction to *De ente et uno*, Pico affirms that this work originated from Poliziano's earlier lectures on Aristotle and was influenced by the ensuing discussions involving Lorenzo, not only attests to Poliziano's primary role in the revival of Aristotelian studies but also aims at ascribing to the *Signore* of Florence the role of active participant and protector of the whole enterprise. Reading between the lines, one may also notice the attempt, on the part of both Poliziano and Pico, to contain the enduring impact of Neoplatonism in Florence and consequently isolate Marsilio Ficino. This attempt must have been quite successful if, less than one year later, in the letter narrating the circumstances of Lorenzo's death (8 April 1492), Poliziano could proudly affirm that, besides the family, only three people were admitted to Lorenzo's deathbed: Poliziano, Pico, and Savonarola.

Summoned by Lorenzo at Pico's request, the Dominican friar Girolamo Savonarola established in Florence in 1490. Thanks to his powerful rhetoric and mesmerizing personality, in a handful of years, he was able to leverage great influence over Lorenzo and the intellectuals around him, so that in Lent of 1492, we find him preaching from the pulpit of S. Lorenzo, the Medici's official church. Around the same time, the Dominican convent of S. Marco, of which Savonarola was appointed prior, became the main center of learned conversation among Florentine intellectuals. If Savonarola's teachings certainly had a relevant impact on Pico and Lorenzo – whose later works acquired an unmistakable religious tone – there is no general agreement among scholars on the extent to which he held sway over Poliziano. From a careful reading of the *Apologeticus de ratione poeticae artis* (1491), it seems that the views on literature and poetry thereby expressed by the friar and prophet in the making had many points *from that of Savonarola's* contact with those professed by Poliziano in those years, especially with regard to the reassessment that devalued poetry in favor of philosophy and, inevitably, of theology. But concomitantly with the publication of the *Apologeticus*, Poliziano released the *Nutricia*, composed in 1486, but previously left unpublished and eventually printed in two different editions (Florence and Bologna) between

the spring and summer of 1491. In this grandiose Latinate poem – whose title means “wet-nursing wages” and refers to our debt to poetry, that is, our wet nurse – Poliziano celebrates poetry, sent by God to mankind, as the supreme civilizer. Besides teaching men the concepts of law, reason, honesty, decorum, and justice, it shows them “how powerful is the force seeking for the truth” (Bausi 2006, 683). This was a completely different view from that of Savonarola, who believed that poetry and truth belong in two separate realms and, more dangerously, that cultivating the former poses a fatal threat to the pursuit of the latter.

After the death of Lorenzo de’ Medici, we find Poliziano more often in Florence rather than in Fiesole. He needed to stay close to his former pupil Piero, Lorenzo’s son and successor, on whom he still hoped to exert some influence. In these very last years, Poliziano was involved in countless polemics and quarrels (against Scala in Florence, Marullo in Naples, Merula in Milan) in which the personal component is often inextricably connected with the political one. It is in this light that we should read Poliziano’s last major literary endeavor, the *Liber epistolarum*, a collection of letters. This work, whose publication was announced to Piero on 23 May 1494, was actually released only posthumously in 1498, edited by two of Poliziano’s closest *familiares*, Pietro Crinito and Alessandro Sarti, who heavily manipulated the work’s original structure. The *Liber* constituted a widely orchestrated operation of self-invention aimed at supporting Piero’s fragile diplomatic relations as well as Poliziano’s now fragile position. It had an instrumental nature: it is noteworthy, for instance, that the majority of the letters can be ascribed to the very last years of the 1480s and especially to the early 1490s, the moment when the necessity of good publicity was most pressing. From its outset, the epistolary leaves no doubt as to its real goals: we are presented with a gallery of portraits of *homines doctissimi* who make up the “international” network that would sustain Poliziano’s own reputation: Pico, Ermolao Barbaro, Pomponio Leto, Battista Guarini, Filippo Beroaldo the Elder, Niccolò Leonicensi, and many others.

Poliziano died between 28 and 29 September 1494, a few weeks before the death of Pico and the entrance of the French King Charles VIII into Florence, which ultimately overturned Piero de Medici’s power. Despite the vicious rumors spread by his detractors concerning Poliziano’s immoral conduct, with Savonarola’s approval, Poliziano was buried with the Dominican vest in the convent of San Marco, where he had held his last learned conversations and whose library he so often frequented.

Poliziano and Philosophical Texts

Poliziano approached philosophical texts at various levels. He lectured or translated them, or used them in his activity as a commentator of classical authors. It is uncertain when he exactly took an interest in philosophy, but the obvious influence of Neoplatonism in his juvenile Latin version of the first books of the *Iliad* (1470–1473) leads us to think that he did so very precociously. His earliest Latin versions of Greek philosophical works date to the summer of 1479. The first of these translations is pseudo-Alexander of Aphrodisias’ *Problemata*, which he, along with other humanists such as Theodorus Gaza and Georgius Valla, did not consider spurious. This is a collection of “problems” or “questions” covering various topics and transmitted to us in a total of four books. Poliziano translated all the questions of book I, with the exception of no. 148 of the standard Ideler edition. What led him to this semi-obscure work is unknown, but from a letter Poliziano sent to the jurist Pandolfo Collenuccio, it seems that he might have been lured by some unusual stories contained in pseudo-Alexander’s work, such as the one telling of the perverse love between the Greek god Eros and one of the Erinyes. Albeit minimal, the information we can gather about the translation of the *Problemata*, if read in the light of Poliziano’s later achievements, testifies to some central features of his *modus operandi*: the predilection for literary sources in the original Greek; the preference given to lesser-known authors and episodes of literary history, the attention to negative or harsh aspects of reality, and the interest in an ethical-naturalist approach to

ancient myths. This translation does not seem to have enjoyed much circulation and was in fact printed only posthumously in the 1498 Aldine, together with a letter by Petrus Crinitus to Giovanni Francesco Pico della Mirandola, Giovanni Pico's nephew. There, the former spoke of Poliziano's will to revise this translation, which was prevented by his death. Crinitus at first was tempted by the idea of discarding this text but decided nonetheless to include it in his master's collection.

Together with the *Problemata*, in the same summer of 1479, Poliziano translated the Stoic philosopher Epictetus' *Encheiridion* [handbook]. This work seems to have had a special appeal for Poliziano, as it offered him space for exercising his philological skills; it satisfied his craving for lesser-known or remote texts; furthermore, it could be of some practical use. This very last reason made Lorenzo de' Medici, who was the dedicatee of the work, also its practical addressee. As a matter of fact, around that time, Lorenzo was suffering pressure from every front: political, military, and financial – for warfare, plague, the unpredictable games of alliances, and the chronic need for money had all consumed him. So, if Poliziano could not actually fight by his patron's side – we should not forget that in December of that year he refused to accompany Lorenzo to Naples – he was still able to offer his support by helping him win another war: that waged within his patron against the afflictions of his own soul. In this regard, the translation was meant to furnish Lorenzo with the weapons of philosophy. Following Epictetus' golden rule ("bear and forbear") (Ang. Polit. 1553, 394), Lorenzo had to bear the turns of fate as well as the criticism of his adversaries and forbear the blows of passion. The publication of the *Encheiridion's* translation stirred a polemic with Bartolomeo Scala, the powerful pro-Medicean chancellor of Florence who had had a long-standing interest in philosophical matters, producing, among other things, a treaty *On Philosophical Sects* (1458). We do not have the actual letter carrying Scala's criticism, but we can infer its content from Poliziano's apologetic response, entitled *Pro Epicteto Stoico Epistola* (Ang. Polit. 1553, 405–409). The three allegations that Scala made against Epictetus were that he was obscure, that he taught things beyond human capabilities, and that he was mendacious. Poliziano obviously tried to

rebut these accusations, although, to our modern eye, his attempts do not seem entirely persuasive. Of course, his response is interesting in many ways, but two points need especially to be stressed: the first is unprecedented assimilation of Epictetus' Stoicism within Platonism; the second is that the very point that Scala made about the impracticability of Epictetus' teachings and which Poliziano rejects will, in fact, be at the core of Poliziano's later skeptical reflections.

The same ethical preoccupations inform the prefatory letter to Poliziano's translation of Plato's dialogue *Charmides*, dedicated to Lorenzo de' Medici. Its chronology is uncertain: it was begun most certainly after 1473 and was left interrupted probably at the end of the 1470s. In this most interesting document, the pursuit of philosophy, inspired by the Platonic teachings, is presented as the cure for human unhappiness. This is by no means an easy task, "especially for those who do not blush to consider themselves Platonic philosophers." As Plato says in the *Phaedo*, "one has to die, to have the soul itself removed from any vicious contact, and almost claim one's right and freedom." Subsequently, one has to pass the examination administered by supercilious *Temperantia* and confront a group of "chattering, trifling, disgusting, silly, insignificant, petty, envious, haughty people committed to greed as well as to opulence, who don't consider it execrable to handle and taint with their – so to say – filthy hands, like those of the Harpies", that most sacred name of philosophy" (Ang. Polit. 1553, 447). In the fiction of the letter, it is Plato – whom Poliziano incidentally meets on his own way to happiness and whom he calls "the indisputable father of all philosophers and god of all wisdom, almost like an earthly oracle, as they say" (*Id.*, 447) – the champion who will plead the good cause of philosophy against those "philosophers' monkeys" (*Ibid.*). Finally, Poliziano invokes Lorenzo to be the judge in such a trial, inviting him to free his ears and turn his attention to the Platonic teachings. This preface was neither published in Poliziano's lifetime nor alluded to by contemporary witnesses: Poliziano possibly wanted to avoid the contentions which might have arisen between him and Ficino on the interpretation of Platonism in a moment in which the

latter was establishing himself as the philosophical guide of Lorenzo de' Medici.

In the *praelectio* entitled *Lamia*, there are some striking textual similarities with the prefatory letter to the translation of the *Charmides*, but Poliziano's attitude toward Plato and Platonism has changed dramatically. As a matter of fact, if over the 1470s and for part of the 1480s Poliziano's view of Plato remained substantially unchanged, it acquired a new, more problematic profile in the early 1490s, at a time when, urged by his academic opponents, he decided to tackle the question of philosophizing. He does so in the *Lamia*, which contains his most original treatment of philosophy and of the role of the philosopher. As a matter of fact, when Poliziano started lecturing on philosophical texts, the prominent philosophers in the Florentine academe heavily resented such an intrusion on his part, so he decided to rebuke their allegations publicly with the *Lamia* at the beginning of the academic year 1492. Earlier that year Lorenzo, who was the patron of the studio as well as of Poliziano himself, had died, and for the first time, Poliziano was confronting a demanding audience without his protector's backing. So the time had come for him to attack his opponents before they could land the first blow. Building on Italian folklore and classical tradition – namely, Plutarch – Poliziano disparagingly calls them “lamias,” nosy creatures that are able to remove their eyes at will, pointing out other people's faults while ignoring their own. In the first part of the *praelectio*, Poliziano provides what we may call a revisionist account of some philosophical sects, imbued with irony when not with sarcasm; in doing so, he refrains from a frontal attack and articulates his critique along the swift lines of rhetorical association, targeting the extravagance, the sectarianism, the vacuity, and also the avidity of certain so-called philosophers. In broader terms, Poliziano expresses his discomfort with some of the traditional tenets on what philosophy is or should be, allowing us some glimpses, by contrast, of his own ideas on philosophy. Although not openly ridiculed – unlike Pythagoras and his doctrines with which they were commonly associated in Renaissance Florence – Plato and Platonism are partly exposed to Poliziano's criticism against an utterly abstract and lofty form of philosophizing.

So, if man's dedication to Platonism is the core of the preface and translation of the *Charmides*, as well as the reason why Poliziano invites Lorenzo to embrace Plato as a philosophical guide, in the *Lamia*, instead, Platonic philosophy is one of the many possible modes of philosophizing and one that appears to Poliziano as ultimately impracticable. In the second part of the *Lamia*, which textually reproduces an improvised trial to which Poliziano is brought by his detractors, he directly attacks them. The lamias' accusations do not discuss the merit of the philosophy he is allegedly professing; rather, they call into question its legitimacy, because, in their view, he did not have the professional title necessary to philosophize, a title that, moreover, he refuses: “not that I am ashamed of the name ‘philosopher’ (if only I could live up to it in reality!); it is more that it keeps me happy if I stay away from titles that belong to other people” (Celenza 2010, 199). Poliziano's defensive line is grounded in the rejection of a title that he believes does not belong to him and in embracing and opposing another one, that of *Grammaticus* (i.e., philologist): “I lay claim to no other name than that of philologist” (*Id.*, 247).

A uniquely dense text, the *Lamia* leaves open many questions, such as the identity of the nosy creatures: some scholars have detected in the oration strong anti-Ficinian traits, while others, emphasizing its academic setting, traditionally dominated by masters of strict scholastic persuasion, have set the oration in the tradition of the early humanist, anti-scholastic invective, in the footsteps of John of Salisbury and Petrarch's *De ignorantia*. But the *Lamia* also reveals a new scenario, where a comparison is made not among different styles of philosophizing, as in the first part of the oration, but between philosophy and philology. To understand the relation between these two activities, one must think that Poliziano conceived of them as two disciplines that are strictly intertwined, both of which aim at answering, within their own modalities, the question of truth. As Poliziano had already argued in his unpublished notes to Statius' *Silvae* (1478), the quest for truth is not a task exclusive to the philosopher, as he shares it with those who practice the other *bonae artes*. In this perspective, philosophy and philology, as well as the other

arts, are parallel disciplines, since they both point to the truth even if they move on different tracks. But in the *Lamia*, as we have seen, these two tracks suddenly diverge: the path of philosophy is abandoned to its lofty and dubious glory; philology, instead, is radically embraced, at the point of constituting Poliziano's new identity, that of *Grammaticus*. In fact, devising these issues in terms of a struggle between philosophy and philology can be misleading. In the *Panepistemon*, the *praelectio* to Aristotle's *Ethics* of the previous year, Poliziano had distinguished three types of philosophy: theoretical, practical, and rational. Rational philosophy "explains or narrates or demonstrates or persuades or entertains. From it, grammar, history, rhetoric and poetics are derived" (Ang. Polit. 1553, 463). In this perspective, philology in its widest meaning is a form of philosophy. Therefore, according to his statements in the *Lamia*, Poliziano sets aside theoretical and practical philosophy, that is, metaphysics and ethics. Thus his rejection is not of philosophy as such but of the idea that philosophy can actually grasp some universal truths. It is as though, over the years – that is, at the very least from 1478 onward – Poliziano had progressively circumscribed the realm of (viable) philosophy until he realized that man is constitutionally unable to reach the goals set by some subdivisions of philosophy.

These last considerations lead us to the question of Poliziano's association with skepticism, among the most debated in recent scholarship. By no means is he a forerunner of Pyrrhonism. His scant interest in theology and metaphysics should not be taken as a form of atheism or radical skepticism. He approaches them as two separate disciplines, whose documents and monuments he treats philologically. As for theology, some contemporary witnesses recorded Poliziano's engagement in subtle discussions as well as the interest he showed in works of a religious nature in the last years of his life, but it seems fair to say that he preferred not to get involved in such delicate matters (not by chance, when Poliziano occasionally lists the series of authors to explain and lecture upon, he never mentions theologians). Poliziano certainly knew the writings of the skeptical philosopher Sextus

Empiricus, but Poliziano's extant annotations betray his usual doxographic rather than doctrinal interest, which certainly cannot be compared with the extraordinary use that Pico's nephew Giovanni Francesco will make of the same author a few years later. Poliziano's philological vocation, a veritable priesthood of textuality, absorbed any expression of thought to its textual dimension, so that the questions he addressed were often reduced to the exact determination of the author's intention, without a further discussion on their philosophical, practical, or ethical validity.

Poliziano never wrote systematic philosophical works nor erected speculative monuments – things we may expect from a philosopher in the modern sense of the word. Still, his ethical concerns, his investigation of truth and its conditions, his keen interest in all things philosophical, the vast amount of philosophical texts to which he had access, the nature and number of debates in which he was involved, the quality of thinkers with which he exchanged ideas, and the vibrant environment where these exchanges took place – all deserve the attention of philosophical scholarship and historiography. But apart from the single, specific philosophical issues he addressed, Poliziano's most original contribution to Renaissance philosophy is one of the methods, namely, what we may call the "grammatical" or philological method.

This method regards a set of practices, which Poliziano refined over time through his study of the most diverse works by classical and medieval authors and which he subsequently applied to the writings of philosophers. Poliziano's main goal was the textual restoration of a given work according to the original will of its author. Secondly, he would also provide an interpretation, an explanation or some clarifications. This formidable alliance between ecdotics and hermeneutics reveals Poliziano's technique at its best. His *modus operandi* is illustrated in the two *Miscellanies*, which contain a number of ingenious insights into textual criticism stemming from relentless observation and in-depth reflection on the often not systematic methodologies of authors, readers, scribes, and "occasionally" librarians. These innovative practices feature the assessment of every single witness available with regard to its quality (genuineness, reliability, completeness)

and to its relation with other sources (Poliziano was among the first to practice the “genealogical method” in textual criticism); the replacement of a generic system of reference with precise citations, often including the place where a given manuscript or codex was kept; the use of extraliterary sources, such as epigraphs or ancient coins; and the massive, unprecedented use of sources in the original Greek, something that very few humanists could do. In this regard, Poliziano’s approach to the Aristotelian tradition is exemplary: he aggressively despised most medieval commentators, whose works he deemed as sterile appendixes in convoluted Latin despite their continued widespread use in universities, and privileged the earliest Aristotelian commentators like Ammonius, Philoponus, and Simplicius. This distinct shift obviously had major consequences not only with regard to the Aristotelian texts these commentaries were meant to illustrate but also to the very writings of these authors, which began circulating again: a splendid example of textual care turned into intellectual dissemination.

Abstract

David ben Isaac de Pomis was an Italian linguist, physician, and philosopher. His life and work are considered a paradigmatic attempt

at strengthening the relationship between Jews and Christians. He did so by comparing the two traditions, showing their similarities, and emphasizing the common destiny of Jewish and Christian peoples. The study and practice of the medical profession provided him with an intense and fruitful intercultural field but also confronted him with the strong religious prejudices and political obstacles posed by Christian society and legislation. Thus the training of Jewish students at the medical faculties of the universities in Central and Northern Italy played a significant role in defining the status of Jewish physicians and fostering interaction between Christian and Jewish scholars (Shulvass 1973). Furthermore, the discovery during the Renaissance of numerous ancient medical texts was of great benefit to Jewish medical scholars, since they often had privileged access to them through Arab intermediaries. Especially in Venice, Jews were often highly appreciated for their expertise and skills in the medical profession, and several of them were exempted from the traditional ghetto curfew and from wearing the yellow biretta, the headgear usually required of Jews. Venice was the town where David de Pomis arrived in 1569, after being compelled to migrate for a long time from one town to another by strict anti-Jewish legislation imposed by the Church. He remained there for the rest of his life. The tolerant atmosphere of the city, extolled by de Pomis in all of his writings, allowed him to practice medicine and at the same time compose his various works. He produced medical treatises, translations, and commentaries of biblical texts, but his most important works are the *Ṣemaḥ David*, a trilingual dictionary of Hebrew, Latin, and Italian, and *De Medico Hebraeo*, an apology for the Jewish medical profession. As a highly estimated physician and scholar, de Pomis must be considered a relevant figure in facilitating both the exposure of the Christian learned society to Jewish medical studies and the intellectual exchange between Jews and Christians (Guetta 2014). He was recognized by many scholars for his commitment to defending the social position of Jews,

criticizing common Christian prejudices, and promoting Jewish-Christian dialogue.

Biography

David ben Isaac de Pomis (the original Hebrew name of the family is מִן הַתַּפּוּחִים, *Min ha-Tappuḥim*) was born in Spoleto in 1524 (Luzzati 2000). In the preface to his main work, *Ṣemah David*, de Pomis traces his family's descent to one of four illustrious families that were brought from Jerusalem to Rome as slaves by Titus. The original wealth of de Pomis family was lost by his father (de Pomis 1587; Toaff 1975), the learned Isaac de Pomis, soon after David's birth: the sack of Rome in 1527 persuaded Isaac de Pomis to dispatch his property from Spoleto to the cities of Camerino and Civita. On the way, the convoy was attacked by troops of the Colonna family, and the property confiscated. Subsequently, the family left Spoleto and settled in Bevagna, where the young David received his first education from his father. In 1532, the de Pomis family again moved, this time to Todi, where David studied with his uncles, Rabbis Jehiel (Vitale) Alatino and Moses Alatino (1529–1605), who introduced him to the study of medicine and philosophy. In 1545, de Pomis began to study at the University of Perugia, where he earned the title of *Artium et Medicinae Doctor* in 1551. He then practiced medicine in Magliano Sabina, not far from Rome, and at the same time held the position of Rabbi. In July 1555, Pope Paul IV (1476–1559) issued a bull, *Cum nimis absurdum*, which placed further restrictions on the activities of the Jewish population in the Papal State, and the many religious and economic limitations led to the creation of the ghetto in Rome. This anti-Jewish policy prohibited the Jews from owning property and Jewish physicians from practicing medicine among the Christian population. Therefore, de Pomis lost all of his property and his rabbinate and began serving Count Nicola Orsini and, 5 years later, the Sforza family (de Pomis 1587). With the accession to the papacy of Pius IV (1559–1565), life for the Jewish population improved considerably. De Pomis journeyed to Rome, where he delivered a speech in Latin

before the Pope and the cardinals, thereby obtaining permission to practice the medical profession among Christians at Chiusi. Unfortunately, the Pope died a few days after that meeting, and the permission granted to him was revoked by the new Pope Pius V (1565–1572). This event moved de Pomis to spend a long period of time wandering throughout Italy. He finally settled in Venice in 1569, where he also published most of his works. Only later, with Pope Sixtus V (1585–1590), was the original permission renewed.

Works

De Pomis' medical writings reflect the specific cultural and religious atmosphere in Venice during the Renaissance. Forced to settle in Venice due to the strongly anti-Jewish legislation in the Papal State, he enjoyed the tolerance of the Venetian government by gaining high esteem and reputation in the city. During that time, David de Pomis wrote his first works, an Italian translation and commentary of *Ecclesiastes*, written in 1571 and dedicated to Cardinal Marin Grimani, and the *Discorso intorno a l'humana miseria e sopra il modo di fuggirla* (*Discourse on Human Suffering and How to Escape it*). The book, printed in 1572 and dedicated to Margaret of Savoy, was conceived as an appendix to his translation of *Ecclesiastes*. He also published a number of medical writings, such as a treatise on the plague, *Brevi Discorsi et Efficacissimi Ricordi per Liberare Ogni Città Oppressa dal Mal Contagioso* (*Short Discourses and very Effective Advice to Free Every Oppressed City from Contagion*) printed in Venice in 1577; and on the maladies of old age, *Enarratio Brevis de Senum Affectibus Praecavendis Atque Curandis* (*Short Exposition Concerning Prevention and Treatment of Senile Maladies*), which was dedicated to the Doge and Senate of Venice and published in 1588 (Münster 2003). De Pomis' most famous work is the *Ṣemah David. Dittionario novo Hebraico* (*Plant of David. New Hebrew Dictionary*), a trilingual dictionary of the Hebrew, Latin, and Italian languages. The esteem and the wide consensus he gained in Venice motivated him to write his

second widely renowned work, *De Medico Hebraeo. Enarratio Apologica* (*On the Jewish Physician. An Apologetic Exposition*), a defense of Jewish physicians, intended to highlight the similarities between Jews and Christians concerning the practice of medicine. Probably after 1591, he produced the *Index novus in singulis Hippocratis libris cum annotationis propriis*, mentioned at the end of his *Enarratio Brevis de Senum Affectibus*, but the work is no longer extant. He also wrote two discourses in Vernacular: the *Breve discorso nel quale se dimostra la maestà divina haver particular cura e custodia della repubblica Venetiana* (*Short Discourse Showing the Divine Origins of the Venetian Republic*), dedicated to Giacomo Contarini, which was lost until it was recently rediscovered by Guido Bartolucci (2005), and the *Discorso meraviglioso sopra la guerra promossa da Selim, imperatore de' Turchi* (*Wonderful Discourse on the war initiated by Selim, Turkish emperor*), dedicated to Antonio Veranzio de Schybenik, Archbishopric of Esztergom. The texts were follow-ups of a memorandum he sent to the Venetian authorities after the victory in 1571 at the battle of Lepanto between the Ottoman and the Holy League forces, in which he tried to prove the continuity between Venetian institutions and biblical history.

Šemaḥ David (Venice 1587)

De Pomis' fame derives from the *Šemaḥ David*. *Dittionario novo Hebraico, molto copioso, dichiarato in tre lingue* (Venice, 1587), the aforementioned trilingual dictionary in Hebrew, Latin, and Italian, printed by Giovanni de Gara and dedicated to Pope Sixtus V, known for his more tolerant attitude. The preface to this work includes the author's autobiography, written in Hebrew, with his genealogy back to Elijah de Pomis, Rabbi and chief of the Jewish community of Rome, who was martyred in 1298. The work was modeled after the Talmudic and Midrashic dictionary, the *Arūkh*, by Rabbi Nathan ben Yechi'el Min Ha-'Anawim (1035–1106), a signed manuscript of which was in de Pomis' possession. Other sources were the Hebrew dictionary, *Sefer Hashorashim* (*Book of Roots*), by Rabbi David Kimhi (1160–1235), and the *Tishbi* by Rabbi

Eliāhu Levi Bachūr Tedesco (1468–1549). The aim of this work is to harmonize the Mosaic Law with the liberal arts. The work constitutes something completely new to the Jewish literary scene thanks to de Pomis' exact explanation of the three languages. The Hebrew and Latin were compared side by side, while the Vernacular was separate. The dictionary yields valuable insight into de Pomis' other writings and gives us an idea of what the lost works could have been. For example, he also refers to *Sukkat David* (*The Tabernacle of David*) and *Migdal David* (*The Tower of David*) as well as alluding to translations of and commentaries on Job and Daniel, which were never printed and remain lost.

De Medico Hebraeo. Enarratio Apologica (Venice, 1588)

De Medico Hebraeo is an apology designed to combat deep-seated prejudices of the Christians, especially concerning Jewish physicians treating Christian patients. The topic was a pressing one. During the Renaissance, Jewish physicians met with an ambivalent, even contradictory, attitude: on the one hand, ecclesiastical dignitaries such as the Pope actively sought and appreciated medical treatment by Jews. Indeed modern medical knowledge coming from international sources and continuous migration, which was often the result of anti-Jewish legislation, set Jewish physicians apart from the Christians (Fuchs 1990). On the other hand, the same medical practice continued to be openly discredited in an effort to foment fear and suspicion against the Jewish population. During the sixteenth century, the authority of Popes Paulus IV (the bull *Cum nimis absurdum*, 1555) and Pius IV (the bull *Dudum e felicis recordationis*, 1562) strictly forbade Christians to be treated by Jewish physicians. Pius IV introduced the obligation of the Christian faith as a condition for graduation in medical studies in an effort to exclude Jews from practicing medicine professionally. The Church actively propagated the belief that by treating the bodies of their patients, Jewish physicians also damned these peoples' souls. It followed also Pope Gregory XIII's bull, *Contra medicos Hebraeos* of 1581–1581 against which de Pomis's reacted by writing a second

work in defense of Jewish physicians, printed in 1588 and dedicated to Francesco Maria II, Duke of Urbino.

Venetian authorities resisted those pressures and officially showed their esteem for de Pomis as well as some other Jewish physicians by allowing them to treat Christian patients. De Pomis expressed gratitude and praise of Venice in all of his works, repeatedly referring to the divine origin of the city. In the preface to *De Medico Hebraeo*, which is dedicated to Doge Pasquale Cicogna (Doge of Venice from 1585 to 1595), he glorifies the government of the city by drawing a comparison with Moses' Laws. This commendation of Venice's government is indeed a Latin translation of the *Breve discorso*. De Pomis actually praises republican ideas as the foundation of good government, comparing the Venetian constitution to the Mosaic one. This *laudatio* was influenced by the ideas of the Portuguese philosopher Isaac Abravanel (1437–1508), who bravely compared the figure of the Doge to that of Moses in his biblical comments. De Pomis' book is a good example of a Renaissance Jewish intellectual figure attempting to show not only the innocuous role of Jews in society but also to showcase their merits and the benefits they bring to Christian society. De Pomis points out the willingness of Jewish physicians to render assistance to any patient without distinction, and their loyalty in different circumstances, but also argues that this attitude is in accordance with the biblical and Talmudic teachings. In doing so, de Pomis seeks to legitimize the exercise of medicine by the Jews and to refute the general prejudices against Jewish tradition and religion. In line with this purpose, the final section of the work includes a Latin translation of a selection of Talmudic rules in order to show that there are no reasons to despise the Talmud.

Filosofía, Universidad de Sevilla, Sevilla, Spain

Abstract

Pietro Pomponazzi (Mantua 1462–Bologna 1525) was undoubtedly one of the most important philosophers of his time. After receiving his doctorate in arts from the University of Padua in 1487, he spent most of his life there as well as in Bologna teaching natural philosophy and commenting on the books of Aristotle with great success. His work went beyond the purely scholastic realm and caused an enormous controversy which finally did not culminate in an official process against Pomponazzi because of the intervention of Cardinal Pietro Bembo, among others. Pomponazzi's main intention was to analyze thoroughly the most important premises and elements of Aristotelianism in order to determine whether or not it could fit in with the great dogmas of Christian thought about the world and human beings. The result of this analysis was a handful of writings of great historical significance such as the *De immortalitate animae* (1516), the *De fato*, or the *De incantationibus* (both of these published posthumously): in all of them, Pomponazzi denied that the immortality of the soul, human freedom, or supernatural explanations for certain events, like miracles, could somehow go well with Aristotle, the

paradigm of rationality still in the early sixteenth century.

Biography

Pietro Pomponazzi was born into a prominent family from Mantua in 1462. Probably influenced by his familiar context, he was always proud to be a Mantuan: this could be seen in his own writings, where he never missed an opportunity to cite the verses of another famous Mantuan, Vergilius Maro – usually called by him “Vergilius noster.” In 1484, Pomponazzi entered the University of Padua. There, he was lectured by three important scholars who played a decisive role in the formation of his own thinking (Pomponazzi always professed great affection for them). Francesco Neritone taught him the metaphysics of St. Thomas and gave him the theoretical bases of Thomism. Pietro Trampolino taught him natural philosophy, imbuing him with the elements of Aristotle’s psychology. And, finally, Pietro Rocobonella, a professor of medicine, showed him the interconnection between the body and soul and made him well aware of its importance to get effective therapeutic procedures.

In 1487, Pomponazzi obtained his doctorate in arts and almost immediately lectured on natural philosophy in Padua, soon achieving the respect and consideration of his students: in a letter to Tommaso Lippomanno dated October 4, 1489, Francesco Gonzaga – illustrious countryman of Pomponazzi – precisely mentioned the “opinione grande già concepta e stabilita” that the students had of the knowledge and personality of his teacher. According to the curriculum of this university, Pomponazzi had to expose the natural books of Aristotle (*De anima*, *Physica*, *De caelo*, and *De generatione et corruptione*) and the commentaries of Averroes; on holidays, he discussed the *Meteorologica* and the *Parva naturalia*.

In 1492, Pomponazzi held the chair of ordinary philosophy “secundo loco”; 3 years later, he received his doctorate in medicine, which promoted him to the chair of ordinary philosophy

“primo loco.” His *concurrrens* was Agostino Nifo (Suessanus), who would eventually become a powerful opponent in the debate on the immortality of the soul. Pomponazzi always felt for him a deep aversion that he could barely hide behind academic courtesy.

After 8 years of teaching in Padua, Pomponazzi moved to the court of Alberto Pio in Carpi, where he served as professor of logic and, together with Alberto Pio himself, studied the English mathematician Richard Swineshead (Calculator). As a result of the confrontation between Alberto and his brother, the former was forced to leave his city and head into exile in Ferrara, where his court stayed. Pomponazzi remained there until 1499, when he was summoned from Padua to succeed Nicoletto Vernia, who had just passed away.

In this second Paduan period, Pomponazzi had illustrious *concurrentes* like Achillini, Nifo himself, Francanziano, and Bacilieri. Also, at this time, Pomponazzi had some brilliant students who shone in different areas afterwards, such as Gasparo Contarini – future Cardinal – with whom Pomponazzi always maintained a cordial and affectionate relationship beyond their doctrinal differences over the immortality of the soul; disciples of him were also Andrea Mocenigo, Antonio Surian, and the humanist Lazzaro Bonamico. Over these years, the academic success of Pomponazzi was enormous: in 1504, the senate granted him the exemption to be subject to students’ vote at the end of the course. As a matter of fact, thanks to the work of his disciples, a collection of courses delivered in this transitional period has come down to us: among other manuscripts, we have those which compile his comments on Book III of Aristotle’s *De anima*, a *Quaestio de materia caeli*, a *Lectura super 8 Physicorum*, and some *Quaestiones de immortalitate animae*, *de unitate intellectus*, *quomodo fiat intellectio* (Pomponazzi 1966).

In 1509, Pomponazzi, who had lost his first wife, was claimed by the Duke of Ferrara, Alfonso d’Este, to take up a professorship at the university of that city. Pomponazzi achieved the dispensation of his contract at the University of Padua

from the Venetian Senate, and headed to Ferrara, where he stayed only 1 year since the war between Venice and the League of Cambrai forced to close the *Studia* (a little earlier also the University of Padua had to suspend all its activities).

From Mantua, where he had lived for nearly 2 years, Pomponazzi went to Bologna to lecture at its university as an ordinary professor of philosophy. He remained in Bologna until his death in 1525.

In 1516, Pomponazzi published his *Tractatus de immortalitate animae*, which immediately caused a bitter controversy from which Pomponazzi tried to defend over the next 3 years (Pomponazzi 2013b). Ambrogio Fiandino, Suffragan Bishop of Mantua, was the first to lead a severe criticism from the pulpit against the doctrine contained in the *De immortalitate animae*. Despite this, in a face-to-face interview in Bologna that year, Fiandino denied Pomponazzi having attacked him and announced that Agostino Nifo was preparing a text against the *De immortalitate*. At the same time, some Dominican friars in Venice denounced Pomponazzi as heretical to the Patriarch of Venice, Antonio Contarini. He resolved the complaint by condemning Pomponazzi. The sentence was approved by the Senate of Venice, which also instigated a public burning of his book, whose sale was banned. In addition, the book was sent to Cardinal Pietro Bembo so he would take action, but he did not find any heresy in it, nor did Silvestro Mazzolini, Master of the Sacred Palace. In the meantime, in Bologna, some prominent theologians attacked Pomponazzi's book in their lectures but did not write any work against him. Among those theologians, Vincenzo Colzade ran the Dominican school of Bologna and was Master of Bartolomeo Spina, who would become one of the fiercest opponents of Pomponazzi. Likewise, Pietro Manna, a renowned Thomist theologian, criticized Pomponazzi and shared an important epistolary relationship based on the question of immortality.

Over the next 3 years, Pomponazzi was the object of very harsh criticism. One of the attacks came from Silvestris of Prieras, a theologian at the court of Leo X who probably did much to ensure that the Pope publicly recriminated Pomponazzi.

Indeed, this finally happened on June 13, 1518; Leo X ordered him to keep his teaching in accordance with the doctrine of the Lateran Council. However, the discreet intervention of Cardinal Pietro Bembo, Papal Secretary, succeeded in revoking the warning and aborting the process before it could begin. Meanwhile, the scandal failed to undermine the academic authority of Pomponazzi, for that year he was released from the obligation to teach with a *concurrens* and allowed to choose the books and passages he would comment on in his public readings. Besides, in 1518, Pomponazzi published his *Apologia* in Bologna on February 3, although it is likely that he had completed it at the end of 1517 (Pomponazzi 2011a, 2013a). The work is composed of three books of variable length. Very interesting from the biographical point of view, the third narrates in the first person the different episodes of the controversy over the immortality of the soul that happened hitherto.

Even in 1519, the difficulties related to the contention did not stop. The *Defensorium*, i.e., the extensive response that Pomponazzi had written to Agostino Nifo's *De immortalitate animae adversus Pomponatium* (published in Venice in October 1518), was blocked by ecclesiastical authorities (Valverde 2010). The inquisitor Giovanni Teorfinnis and Alessandro de Peracinis, General Vicar, ordered that the book of Pomponazzi had to be accompanied by a formal rebuttal of the mortality of the soul. Then, the latter wrote to Crisostomo Javelli – a prominent Dominican theologian – asking him to redact some *Solutiones* to reaffirm the idea that the immortality of the soul was an article of faith. In this letter addressed to Javelli, Pomponazzi protested the fact that his position had been completely misunderstood: he had never tried to demonstrate the mortality of the soul, but only wanted to highlight that this was the position that better fit Aristotle's doctrine. Furthermore, he accepted without reservations the immortality of the soul as an article of faith. Apparently convinced of Pomponazzi's fideism, Javelli accepted his request and wrote those *Solutiones* which guaranteed the publication of the *Defensorium*. In any case, neither in the *Apologia* nor in the *Defensorium* did Pomponazzi retract the doctrine

exposed in his previous *Tractatus de immortalitate animae* (Nardi 1965, p. 27).

Throughout 1520 and probably the beginning of 1521, Pomponazzi worked on two of his most important books: the *De naturalium effectuum causis sive de incantationibus* and the *Libri quinque de fato, de libero arbitrio et de praedestinatione* (Pomponazzi 2004a, 2011b). In the first, the author addressed the analysis of portentous events under the assumption that they were simple deceits or must be explained as natural events whose very *raison d'être* is in the course of nature and in natural laws. In the second, Pomponazzi tried to prove that Aristotelianism represented not only a hostile domain for the immortality of the soul but also for individual freedom. Probably fearing that the controversy over the *De immortalitate animae* would intensify, Pomponazzi decided to leave unpublished the manuscripts of these two works. They were edited posthumously, both in Basel: the first in 1556 and the second in 1567. Also in 1520, his brother, Pier Giovanni, passed away and Pomponazzi took charge of his two children, Marco and Giulio, whose maintenance and education were carefully looked after.

In 1521, the *De nutritione et augmentatione* was edited in Bologna (Raimondi 2013). It is an extensive writing on the issues which the title announces. Pomponazzi had finished it in early September: it was his last work. In 1524, Pomponazzi got sick from kidney stones. He was forced to interrupt his lecture of the *De partibus animalium* (Pomponazzi 2004b; Perfetti 2004). In the manuscript, collected by a disciple, the disruption of Pomponazzi's teaching is recorded. Given the worsening of the disease, Pomponazzi issued his will in May. Just 1 year later, on May 18, 1525, Pietro Pomponazzi died. Two days after that, a direct witness of his last period, Antonio Brocardo, related the terrible suffering of his Master in a letter, stating that he refused to eat and speak. Finally, on his last night, he dared to say he was leaving happy. One of his disciples asked him where he was going, to which he responded: "where all mortals go." Just a month earlier, the *Tractatus acutissimi* had been published in Venice: this volume collected

all his edited writings, except for the aforementioned *De incantationibus* and the *De fato*, and his *Dubitationes in quantum meteorologicorum*, which appeared posthumously in 1563 (Pomponazzi 2013c; Perfetti 2012; Valverde 2013).

The *De immortalitate animae*: A Naturalistic Vision of Aristotle's Psychology

In December 1513, the Fifth Lateran Council, at its eighth session, finally approved the promulgation of the Bull of Leo X entitled *Apostolici regiminis*. The text reissued the condemnation of the Council of Vienne in 1311 against all those who dared to deny or doubt the immortality of the rational soul or considered it as unique for all men. It dictated that all those authors or supporters of any doctrine which might suppose an attempt against the Christian dogma of the soul should be pursued as heretics. Likewise, the text ordered professors of philosophy to refute these doctrines in their university teaching. This last mandate really forced the philosophers to play the role of theologians and second the ecclesiastical task of preventing the spread of teachings which could turn off toward fields unacceptable for the theological orthodoxy. Philosophy was then at the service of theology to explain, clarify, and defend the principles of the Christian doctrine; this way, the *Philosophi* were invited to sustain the dogma of the immortality of the individual soul, to do so by means of compelling and persuasive arguments, and to refute those who were against this dogma (Di Napoli 1963, pp. 220–221; Nardi 1965 p. 25; Kristeller 1979, p. 192–194).

In the background of the Bull, there was present a tradition – especially consolidated at the universities of Northern Italy – by which their teachers publicly commented on the texts of Aristotle aiming to make them understandable to their students and scrutinize the consequences of these texts as well as those of their most outstanding commentators. In this sense, Averroes was in a privileged position, as is known. This purpose was explicitly carried out in the field of natural reason, not in that of faith, whose superiority was

recognized beforehand, thus leaving the way open to philosophical discussion.

With regard to the question of the nature of the soul, a debate which had been started by Italian Aristotelians in the late fifteenth century became heated during the early sixteenth century in spite of the Bull of Leo X. Among the different interpretations of the psychology of Aristotle, those which came from the Averroists were doubtless many and widespread, but the alternative via of Alexander of Aphrodisias gradually gained general agreement: his paraphrase of Aristotle's *De anima* was translated into Latin for the first time in 1495 (Kessler 2011, pp. 49–81). In any case, it is true that the variety of approaches to the texts of the Master was enormous, especially throughout the sixteenth century, with the result that they are barely covered under the headline “Renaissance Aristotelianism.” Such a variety was also the motor of an interesting exegetical and doctrinal polemic around the question of what had been the real thinking of Aristotle with respect to the immortality of the soul (Di Napoli 1963, pp. 179 ff.; Poppi 1970, p. 22; Pine 1986, pp. 55 ff.). Some commentators, in fact, stressed those texts in which Aristotle had explicitly stated the special character that the intellect had with respect to other psychic powers; others emphasized the unquestioned hylomorphic character that, in Aristotle's opinion, the structure of living beings had. So, what appeared to be, after all, the perfecting factor of something could not be separated from that of which it was the perfection. In short, this was a discussion – not free from influences coming from outside Aristotle's own texts – that reflected a living and dynamic Aristotelianism (Schmitt 1983).

Clearly, in this area, the texts of Aristotle not only were not hospitable to a perfectly finished and seamless doctrine, but also the brevity and lack of clarity with which he sometimes expressed his own thought gave rise to different lines of interpretation regarding the question of the separable nature of the human soul (at least, with respect to its most perfect manifestation, thought). This question had a double character, epistemological as well as biological. From this second perspective, the soul is – in Aristotle's opinion –

only the principle of the activity of a living being. Thus, in this, we may differentiate (perhaps only conceptually) inert matter from this principle which organizes matter, gives it biological functions, and this way allows to develop of a series of activities that go from a lesser to a greater range of perfection. This is the famous hylomorphism of Aristotle, a concept prominently manifested in this general definition of the soul given in *De anima* II.1, 412a29: “The soul may therefore be defined as the first actuality of a natural body potentially possessing life.” Therefore, every activity of a living organism lies in its soul as the very principle of such an activity, since all living beings, from plants to men, are unified under that common definition beyond the degree of complexity of their activities. It was obviously an effective conception, but it closed, or seemed to close, the road to the possibility that the soul might be a separate entity from that matter to which it brings life. The soul must be understood, then, as the true source of the vital functions of a living being, and if this living being – of which the soul is a part – dies, it dies, too. This is valid both for plants and for animals, and eventually also for men, even though the human soul possesses a relative greater complexity and the activities of a human being are more perfect.

Now, was Aristotle categorical about denying the human soul a separate entity? Did he consider that rational thought and the knowledge that came from it could be understood as any other activity of a living being? Aristotle had definitely approached this question in a problematic manner: “In most cases it seems that none of the affections, whether active or passive, can exist apart from the body. This applies to anger, courage, desire and sensation generally, though possibly thinking is an exception. But if this too is a kind of imagination, or at least is dependent upon imagination, even this cannot exist apart from the body” (*De anima*, I.1, 403a6–10). This is the disjunctive hypothesis from which Aristotle sets out the question of the separability of the soul: if the human soul is separable, it must possess an activity that properly belongs to it, carried out without the assistance of the body and labelled as immaterial. May thought be such an activity? In this

passage, Aristotle seems to postpone the answer, but he clearly states the condition on which it depends: it is necessary to verify that thought has not any sensory dependence. Pomponazzi turned his attention to the cited text and affirmed that, taking into account what Aristotle said in *De anima* III (“when one contemplates one must simultaneously contemplate an image”), the answer that Aristotle finally gave was absolutely negative: human intellectual activity, like the rest of the activities we are able to execute, is linked to the body, in this case, through sensory perception.

Pomponazzi's view of this question, which had an illustrious precedent in Alexander of Aphrodisias, did not exhaust its enormous complexity. If we appropriate here Husserl's famous *noesis-noema* distinction, we can say that to think is in a certain aspect a paradoxical fact: it is individual but its result can be universal; it is the product of a temporarily defined process, but it can transcend all limits of time. Every cognitive act has a structure whose base is inevitably linked to sensory perception, never common, and yet, in the end, the building to be erected is unique and valid for all, that is to say, science. Theoretically, the man who thinks does not do it only for himself. In fact, he wishes to get a truth that belongs to all men in every historical moment. Thinking is, in short, an immanent activity that all men are able to do, since we are, after all, biological entities. Its own nature responds to a biological scheme: it is a process that progressively actualizes the possibilities that are present in an individual human being, so that it is only a continuous improvement for a man who keeps in himself future perfections: nothing is more biological. However, despite this, thinking is also a transcendent act because it gives us the opportunity to rise above our own existential limits and allows us to project our activity onto a universal level.

Given this ambiguity, many philosophers have wondered to what extent the act of thinking belongs to the individual who exercises it. For sure, the person who does it is *this* man, the one who is perfected and the acquired perfection first belongs to him. Nevertheless, can it be ensured that this act has been done by him with only his own intellectual instruments, or must he perhaps

share his authorship with a higher reality? From the textual information we have at our disposal, it is evident that Aristotle faced this problem, and the solution he found had the incredible potential to compensate the reader for its lack of clarity by being an endless source of stimulus for reflection.

Hence, the problem to be solved was twofold: first, it was necessary to explain how the material world can act on us and produce intellectual knowledge, that is, how this world can be at the origin of an activity which has an intangible nature. On the other hand, Aristotle also had to explain how we may be able to exceed the knowledge of the individual and take hold of universal structures, namely, how to transcend the realm of the particular sensory experience and achieve with (rather than in spite of) it universal concepts. Aristotle said basically that the passage from the thing sensorily perceived to the intelligible concept, from the particular to the universal, was possible only through the intervention of an active principle which he called *poiētikós*. It is true that the style of the text in which Aristotle mentioned this principle (*De anima*, III.5) is particularly laconic. Those who have commented on it in the course of history have questioned whether, in the mind of Aristotle, that principle is transcendent and unique for all men, or rather a single principle belonging to the faculties of the subject. The beginning of the aforementioned fifth chapter seems clear with respect to the fact that Aristotle points out that this principle is present *in* the human soul. All the same, despite this, the attributes he subsequently gives to it suggest a transcendent nature: it is described as separable, unmoved, without any mixture, and in a state of continuous activity by its very essence (*De anima*, III.5, 430a18-19). Many have considered that from the perspective of Aristotle, these attributes can never belong to a principle completely immanent to an individual thinking subject so as to speak of a transcendent active intellect.

Moreover, around this debate on the transcendence or immanence of the agent intellect, another equally problematic debate was raised with consequences far more important than those located exclusively in the epistemological field: can we

situate some kind of immortality in the thought of Aristotle beyond that which he explicitly attributed to separate entities in *Metaphysics* XII? Or, in other words, is it conceivable that the extraordinary nature Aristotle gives to the *poiētikós nous* involves some kind of immortality for our own advantage? If many participated in the discussion on the external or internal nature of the active intellect, many more debated whether or not, on the basis of its immortality, we may aspire to some sort of individual immortality from an Aristotelian point of view. The question was really difficult to resolve. Those who decided to confront the opinion of Alexander of Aphrodisias could do so only by emphasizing the intrinsic nature of the active intellect (as is known, in his *De anima*, Alexander of Aphrodisias identified the agent intellect with the first cause and stressed the perishable nature of the human soul. Like Pomponazzi eventually, Alexander regarded intellective activity as one of the operations linked to the body since it required images from the senses). These Aristotelians had to face not only Alexander of Aphrodisias in his role of renowned commentator of Aristotle's works but also those others like Themistius, Simplicius, or much later, Averroes himself, who had held a collective noetic and rejected more or less explicitly the possibility of individual immortality (Nardi 1958). The grand champion of anti-Averroism placed St. Thomas, but among Arabs Avicenna had tried to reconcile, in an unusual pirouette, the immortality of the individual soul with the common nature of the active intellect.

The question of the origin of the soul was also linked to this issue as an indivisible part of it. Cardinal Bessarion had already emphasized that, according to Aristotle's approach, it was necessary to establish full reciprocity between the terms "immortal" and "ungenerated" as well as between "corruptible" and "generated," which made the immortality of the soul *a parte post* a conception alien to the Aristotelian principles. Pomponazzi echoed this argument at the beginning of his *De immortalitate animae* and put it directly in the Debts column of St. Thomas' doctrine: "Beloved teacher, in former days when you were expounding the first book of *De caelo* to us,

and had come to that place in which Aristotle tries to show by many arguments that the ungenerated and the incorruptible are convertible, you set forth the position of St. Thomas Aquinas on the immortality of the soul. Although you were in no doubt that it is true and most certain in itself, yet you judged that it is in complete disagreement with what Aristotle says" (Pomponazzi 1956, p. 281). St. Thomas, in fact, had to go to the direct intervention of God to explain that the rational soul does not have its origin in the same process of natural generation which produces the other souls, but it is created by God and introduced into the compound at the culmination of that process.

In his *De immortalitate animae*, Pomponazzi formulated his own idea of the nature and destiny of the soul from the criticism that he had previously made of Averroes and St. Thomas' doctrine. In opposition to both, Pomponazzi thought that the human soul is in itself mortal and immortal only in a certain aspect or, in other words, it is essentially mortal and only relatively immortal. Also, in contrast with Averroes and St. Thomas, Pomponazzi affirmed that, if the soul is to be the form of human beings in the full sense, it has to lack a separate and distinct entity. This is because, in all its activities, including those of the intellect, our soul depends on the corporeal and material, and due to its plurality, it can be understood only from its relationship to the body, never as an independent entity. Finally, Pomponazzi sustained that the origin of the soul can only belong to the same process of natural generation that produces the compound of which the soul is itself an inseparable part. Only this way can Aristotle's text be saved, as well as the intermediate position attributed to man between the upper beings and merely earthly creatures. Rereading the Platonic *topos* of man as a microcosm, Pomponazzi considered the human soul as the most perfect of material forms since it possesses some activities that bring it closer to the Intelligences, which were the only entities Aristotle recognized as pure forms subsisting by themselves. However, this resemblance of activities between the soul and the celestial Intelligences is always limited: "since it is the noblest of material things and lies at the boundary of immaterial things, it savours somewhat of

immateriality, but not unqualifiedly. Whence it possesses intellect and will, in which it agrees with the gods; but rather imperfectly and equivocally, since the gods themselves are completely abstracted from matter, while it knows always with matter, since it knows with phantasms, with succession, with time, with discursiveness, with obscurity. Whence in us intellect and will are not truly immaterial things but relatively and to a slight extent.” (Pomponazzi 1956, p. 322).

This was for Pomponazzi the only way one can bridge the enormous gap between those beings who operate completely independently of matter and those whose being is totally sunk in matter. Indeed this bridge cannot be built from an impoverishment of the first beings, but rather from a kind of sublimation of the second by the intellectual activity that only men are capable of exerting (Perrone 2005). Notwithstanding, this activity, certainly able to go up into the abstract and universal natures, was subjected to a process which in the case of men inevitably departed from the images of the senses. Hence, Pomponazzi insisted that the human intellect required bodily organs which provided the initial object of its activity. This does not mean, as he himself pointed out, that the intellect must be identified with the corporeal sense or that it must be placed in a specific organ as vision in the eye: “Whence we say that the intellect does not need the body as subject in its knowing, not because knowing is in no wise in the body, since if the intellect is in the body it cannot be that its immanent operation is not in it in some fashion. For where the subject is, there must be the accident of the subject. But knowing is said not to be in an organ and in the body only in so far as it is not in it in a quantitative and corporeal manner. Wherefore the intellect can reflect upon itself, think discursively, and comprehend universals, which organic and extended powers cannot do at all. But all this comes from the essence of the intellect, since as intellect it is not dependent on matter or on quantity. But if the human intellect depends on matter, this is as it is joined to sense; whence as intellect it is accidentally dependent on matter and on quantity. Wherefore its operation also is no more abstracted than its essence. For, unless the intellect possessed something that

could exist by itself without matter, its knowing could not be exercised except in a quantitative and corporeal way.” (Pomponazzi 1956, p. 318).

The theoretical framework of this discourse is placed on the conception that there are three modes of separation from matter corresponding to the three ways of knowing that we can find in the universe: there is (a) the total separation from matter by which the Intelligences know and, on the other hand, there is (b) the lowest separation from matter by which the sensitive powers know, in need of a body both as their subject and as their object and limited to particulars. But there is (c) a third and intermediary kind of separation in which the body is required as object, but not as subject: the human intellect. It is a material form, a bodily function generated by the parents and not by special divine creation. Certainly, it represents the supreme and most perfect of material forms, though unable to operate in any way or existing without the body. However, in conclusion, the soul’s essential operation of knowing shows that in a certain manner, it participates in immortality, as it can grasp the universal and the immaterial. In short, while knowing requires material conditions, and is thus the activity of a human body, it does not function materially, but rises above the limitations of those conditions to grasp universals and truth. Knowing demands a body, though it does not take place in any localized part of the body (Randall 1956, p. 273; Kessler 1988, pp. 485–534).

Thence, Pomponazzi probably wanted to stay away from the reductionism of Galen, who had already considered the intellect as a mere organic principle. Yet, doing so, he had to set up a difficult doctrinal equilibrium: the soul is essentially material and only in an incidental way immaterial. Naturally, this could be accomplished only by minimizing the importance of those texts in which Aristotle (following Anaxagoras) clearly claimed the unmixed nature of the intellect in the sense that the material elements do not interfere in its activity or expressly said (*De anima*, III.4–5) that it is immaterial and immortal or that it originally comes from a source external to natural generation (*De generatione animalium*, II.3). Without doubt, Pomponazzi was aware of these

texts and the difficulties that their interpretation involved, as well as of the apparent hesitations of Aristotle himself: "From all of which" it is obvious that many things said by Aristotle about the intellect seem mutually contradictory, when they really are not at all. For he says at times that it is material and mixed, or not separable, but at times that it is immaterial and separable. For in the definition of the soul it is said that it is the act of an organic body; but at times it is said that it is not the act of any body. These seem indeed contradictory. Whence different men have turned into different paths, and some think that Aristotle did not understand himself" (Pomponazzi 1956, p. 324).

Pomponazzi estimated that when Aristotle expressed his own opinion about the intellect in this way, he did so by referring to an intellect *per se* different from that present in man. The intellect *qua human* depends on images, and because this dependence is linked to the body by close bonds, its possible separation is therefore precluded. The intellect *qua intellect* belongs to the celestial Intelligences, which occupy the highest hierarchy of the universe. However, Pomponazzi did not want to enter upon a discussion on the type of relationship between that intellect *per se* and our intellect. He simply states that the human intellect is moved to the reception of all the images by an active intelligence that is not a part of it. With regard to our own intellectual activity, this separate *noûs* has the same causality as the universal motor with respect to the reception of forms by prime matter. It has already been indicated (Pine 1986, p. 77; Valverde 2012) that there is a certain Averroist tone in this assumption, which involves that knowledge is something imposed rather than the product of human creativity. In the Peripatetic tradition, the function of abstracting universal concepts from sensory perception belonged to the active intellect, so if, as Pomponazzi seemed to opine, man lacked this power, then it lacked the capacity to abstract the intelligible forms from perceptible data. It is possible, in fact, that Pomponazzi had to sacrifice on the altar of coherence something as important as the creative capacity of the human mind. This was the toll that he had to pay for defending the idea that the active

intellect is alien to the natural constitution of human beings, an idea crucial to build his thesis of the integral materiality and mortality of man. He tried to explain (or maybe mitigate) this position by means of that ontological scale where human beings occupy such privileged position that permits them to have a soul which, not ceasing to be a material form, is capable of giving them the highest activity in the universe: abstract thinking. In that imperfect version we are able to pursue, this activity can only be a very pale imitation of that fullness of Intelligences, for Pomponazzi strongly denied any ontological link between men and the divine. Indeed, he openly criticized Averroes for placing human happiness in the union of the active intellect with the possible. Pomponazzi built this criticism by turning to common experience: how many men were engaged in the study? It was evident that many more lived as if they did not have any interest in science and knowledge (Bianchi 2003). Furthermore, the way men reach the knowledge of the universal, that is, through a slow and uncertain discursive process, demonstrated by itself, according to Pomponazzi, that our nature is quite another of the separate intelligences, which can reach such knowledge immediately and intuitively. From an Aristotelian point of view, Pomponazzi thought that the only mediation between animals' sensory perception and the pure and separate intellect is that which makes possible the human intellect, but this mediation does not involve the immortality of our soul.

Undoubtedly, Pomponazzi made a courageous reading of Aristotle's texts; despite the fact he had some precedents (Gilson 1961, pp. 173–183; Di Napoli 1970, pp. 214–226; Perrone 1999, pp. xxvii–xxix), we must recognize that he went further than anyone else in the thesis that, from the Aristotelian discourse, the nature of the human soul in its totality is mortal. He also wanted to examine and refute all the extraneous moral and pragmatic arguments for immortality. To know the soul is mortal is in fact a great achievement since it makes possible a secular and human morality, at last, corroborating this way those values the humanists held dear. The whole

human race is like a single man with differing members. All men should communicate in three intellects – the theoretical, the practical, and the productive – for no man fails to possess something of each. The general end of mankind is to participate relatively in the theoretical and productive intellects, but perfectly in the practical. If man is mortal, every man can have the end which suits man from a universal point of view, though not what suits the most perfect part. And this power can make almost everyone blessed. For the rewards and punishments of the hereafter, Pomponazzi has only scorn. The essential reward of virtue is virtue itself, and the real punishment of vice is vice itself. As he says in Chap. 14 of his *De immortalitate*, if one acts virtuously with the hope of reward, his act is not considered as virtuous as that of one who expects no external reward. And he who is punished externally, thereby, diminishes that guilt which is the greatest and worst punishment of vice (Randall 1956, p. 274).

This courageous statement, strongly influenced by Stoicism, is one reason among others which emphasizes Pomponazzi's historic importance (Kristeller 1983). Ernest Renan correctly stated that Pomponazzi really represented the living thought of a time, a brave spirit who adapted scholastic teachings to a new age (Renan 1852, p. 281). But in his eagerness to offer his students and readers a firm alternative to Thomism and in his zeal to observe strictly the basic principles of Aristotelianism, he brought to light its inconsistencies, these of a philosophy that was gradually losing its supremacy in the face of new ways of thinking. One can say, as Pine did (Pine 1986, p. 345), that Pomponazzi unwittingly staged the intimate contradiction which the Aristotelian explanation of the intellect and the intellectual activity involved because it is remarkable that, even if Pomponazzi emphatically affirmed that corruption of the organic functions produced the disappearance of the human intellect, he did not dare to openly state its organic nature; otherwise, he preferred to hide behind that immateriality *secundum quid*, whose lack of definition was criticized later. This latent conflict appeared in Pomponazzi in a double form: first, the more he

analyzed all the psychic functions, the more he found their essential unity and continuity. Thus, it was impossible to attribute organic characteristics to the lower faculties without also doing so to the highest. In contrast to this, he was aware that, if the intellect was considered an organic and material entity, its activity would also be limited in space. This had very dangerous consequences since, how is it possible to explain that an organic faculty is able to generate universal and objective knowledge? How can it be possible that what is limited in time and space is able to produce conceptually knowledge unlimited in time and space? At this crossroad, we find a Pomponazzi not fully defined between a materialistic naturalism and a peripatetic tradition that in one way or another emphasized the essentially immaterial nature of our mind. This tension between the organic and the immaterial, the corporeal divisibility and the spiritual indivisibility, between mind and body, in short, was in fact a constant feature of many Renaissance Aristotelians. On the one hand, they tried to explain the psychology of Aristotle defending the integral unity of all the faculties of the living being. On the other, they wanted to explain the special character of human beings by integrating an external and superior principle into that unity.

The *De incantationibus*

This naturalistic perspective addressed by Pomponazzi to explain Aristotle's psychology was also applied to other natural fields. He showed that in nature, there is an orderly uniformity of law which does not admit miracles nor demons or angels or even any direct divine intervention. This conception had some precedents precisely in the ranks of Mediaeval and Renaissance Aristotelians. For them, the universe is moved by the Prime Being, i.e., the first of the separated Intelligences which generate the motion of the heavenly spheres; just under them, the sublunary field is the arena of birth and decay. As Pine says (Pine 1986, p. 235), this entire emanation proceeds through an eternal, necessary

structure controlled by the Prime Mover Himself. From a strict Peripatetic point of view, the multiplicity of natural effects needs a multiplicity of intermediary causes, not the direct activity of the Prime Mover. These intermediary causes can only be the Intelligences which move the heavenly spheres. But, as the activity of these Intelligences is eternal, constant, and necessary, it is clear that the possibility of miraculous suspensions of natural processes must be laid aside. However, those Aristotelians, as Christians, were able to recognize that God is the real creator of nature; as such, He can impede or suspend natural laws at will. These two perspectives – one denying miracles and the other admitting them – can be formulated by the same Aristotelians, but taking into account that each of them belongs to a different plan. Rather than affirming a kind of “double truth,” they subordinated the Aristotelian view to the Christian view noting that science produced probable theories rather than absolute truths, which are present only in the realm of faith and sacred revelation.

When Pomponazzi wrote his *De incantationibus* (which remained unpublished), he took the path that Albert the Great, Roger Bacon, Siger of Brabant, or Pietro d’Abano had previously mapped out, but once again, he went further. He sought to explain all miraculous cures and events through purely natural causes, natural powers and the constant and regular influence of the heavens. When such events really occurred, they had to be understood as natural phenomena rather than miracles. Therefore, Pomponazzi tried to incorporate them into a universal law conforming to the normal processes of nature. Some of these strange things could be tricks of unscrupulous people or mere *figmenta* of imagination. Nevertheless, it is impossible – Pomponazzi admits – to explain all of them as an effect of trickery or credulity: many reputable historians have reported them as true stories. No doubt, such things happened, Pomponazzi said, but they were caused by conjunctions of the heavenly planets guided and directed by the divine Intelligences. Unlike Pico’s denial of astrology as incompatible with human freedom, Pomponazzi tried to make an orderly and rational

science of the stars, as opposed to all superstition. In his *Apologia*, edited for the first time in 1518, he stated: “All prophesy, whether vaticination, or divination, or excess, or speaking with tongues, or the invention of arts and sciences, in a word, all the effects observed in this lower world, whatever they be, have a natural cause.” Thus, the recorded and related miracles of religion are not events contrary to the natural order, but they are merely unaccustomed and rare. The very conception of an immaterial spirit precludes any particular operation: “In vain do we assume demons, for it is ridiculous and foolish to forsake what is observable, and what can be proved by natural reason, to seek what is unobservable, and cannot be proved with any verisimilitude” (*Apologia*, II, Chap. 7). “No effect is produced upon us by God immediately but only through the means of his ministers. For God orders and disposes everything in an orderly and smooth manner and imposes an eternal law on things which it is impossible to transgress” (*De incantationibus*, Chap. 1).

Many wondrous events, such as, for example, miraculous cures, can be explained as natural if we understand the special properties inherent in all natural beings, many of which are used in medicine. The properties of herbs, stones, minerals, and parts of animals can affect the body in three ways: by direct alteration of the body, by indirect alteration through the transformation into vapours, and finally, by invisible or occult properties. Confronted with these effects of the occult, it is not surprising that the rude ascribed them to God and demons, even if their cause was perfectly natural. The existence of these natural and occult properties in mineral, plant, and animal life leads inevitably to the conclusion that they must also exist in man. “As a microcosm combining and uniting the vegetative, sensitive, and intellectual powers found in nature, man’s own being must also possess, in some degree, the same properties which his constituent parts possess in nature” (Pine 1986, p. 242).

Pomponazzi also gives a naturalistic account of the origin and development of religions: “Those men who are not philosophers, and who indeed are like beasts, cannot understand how God and the heavens and nature operate. Therefore, angels

and demons were introduced for the sake of the vulgar, although those who introduced them knew they could not possibly exist. For in the Old Testament many things are alleged which cannot be understood literally. They have a mystic sense and were said because of the ignorant vulgar, which cannot understand anything not bodily. For the language of religions, as Averroes said, is like the language of poets: poets make fables which though literally impossible yet embrace the truth of the intellect. For they make their stories that we may come into truth and instruct the rude vulgar, to lead them to good and withdraw them from evil, as children are led by the hope of reward and the fear of punishment. By these bodily things they are led to the knowledge of what is not bodily, as we lead infants from liquid food to food more solid.” (*De incantationibus*, Chap. 10). All religious phenomena are thus products of the eternal laws of motion. In this view, religions are seen as governed by the eternal cycle of birth, growth, and decay. Controlled by heavenly powers, these cycles produce the new religions from within the dying forms of the old religions. With the introduction of new religious ceremonies, old ceremonies and usages corrupt, “just as with the introduction of the male sperm, the menstrual cycle disappears” (*De incantationibus*, Chap. 12). Therefore, religions are born and die like all things human; for their renewing, striking signs are needed among men. And powers are placed in nature, whose exercise is rarely called for. “Since a change of religion is the greatest of all changes, and it is difficult to pass from the familiar to what is most unfamiliar, for the new religion to succeed there is need that strange and surprising things be done. Whence on the advent of a new religion men making ‘miracles’ are produced by the heavenly bodies and are rightly believed to be sons of God. It is with religions as with other things subject to generation and corruption: we observe that they and their miracles are weak at first, then they increase, come to a climax, then decline, until they return to nothing. Whence now too in our own faith all things are growing frigid, and miracles are ceasing, except those counterfeit and simulated, for it seems to be near its end.” (*De incantationibus*, Chap. 12).

The *De fato*

In the *De fato, libero arbitrio, et de praedestinatione* (written in 1520 though unpublished like the *De incantationibus*), Pomponazzi made his choice between human freedom and natural law. After a detailed survey of the attempts to reconcile freedom and providence, he concluded that none of them had succeeded. Not being a satisfactory answer to this dilemma, only the Stoics had the most consistent theory in this regard. Accordingly, the order and structure of the universe are the results of direct divine intention; therefore, having established the most rational order possible, God will not change it since any change would imply the destruction of the eternal coherence of nature. As Pomponazzi himself declared, God is “crippled by nature” (*De fato*, II, Chap. 7). So, even God’s freedom is limited by the order that He has established. At the same time, the movement of the heavens, stemming from the Prime Mover Himself, gives rise to a chain of causes which controls man by establishing the disposition of his nature and the directions of his actions. In conclusion, God and man are chained to an eternal, cyclical order of causes and neither is truly free (Pine 1986, p. 297; Perrone 2004, p. xi). The great variety in human habits and customs, and the existence of different moral dispositions, are just evident expressions of the diversity present in nature, which is necessary for its coherence no less than the divergence of animal, plant, and mineral natures. There can be no question here of justice or injustice and cruelty or kindness for two reasons: the universe requires this diversity for its order and the fixed compositions of all natures indicate, again, that God cannot alter the smallest aspect of the universal order. Thence, within human history, the oppression of the poor by the rich, the weak by the aggressor, and the martyr by the tyrant is all a necessary working out of human dispositions. A balance is, nevertheless, achieved by historical cycles which will ensure that one day the oppressed will be oppressors, the strong weak, and so on: “Humana enim natura – Pomponazzi said – est quoddam universum” (*De fato*, II, Chap. 7). We see that just like some men

live *veluti Dii* (e.g., all the prophets and saints), others live like animals and show the same habits as lions, vultures, or wolves. But this should not be imputed to a perverse will in God himself. The greatest advantage of the Stoic system, Pomponazzi concluded, was that it removed such imputation of evil from God. The varying dispositions of men, which under the heavenly influence produce the saint, hero, and warrior, are not the result of a free divine act. Rather, they are part of an eternal, universal structure, unalterable in its very nature. Therefore, good and evil exist as an integral part of the eternal, unalterable structure of the universe, and the human will is simply an element in this eternal process.

Anyhow, this Stoic determinism that Pomponazzi extracted from the core of Aristotelian physics (Perrone 2004, p. lxiii) is not his final word. In books III through V, he proposed a novel Christian solution to the problem of divine providence versus free will. This was nothing less than an attempt to develop a rational Christian theology as an alternative to this Aristotelian-Stoic determinism and involved a great shift in method for Pomponazzi. All his earlier treatises stressed the opposition between reason and faith. Indeed, they maintained the opposition to these two modes on the ground that faith is either superrational or irrational. Now, one could find that Pomponazzi explicitly wanted to defend the religious view of providence after accepting the assumptions of faith. As Pine and later Perrone said, the complexity of the *De fato* consequently made it entirely different from Pomponazzi's other works. The previous opposition between rational philosophy and a superrational faith was then dissolved. In its place, we find a dialectic between two different rational arguments. The first, based on pure reason alone, defends the strict Stoic-Aristotelian determinism, while the second seeks to discover, within the givens of revelation, a basis for divine and human freedom (Pine 1986, p. 302).

This dramatic change of perspective in Pomponazzi's procedure has been interpreted in

very different ways. Giovanni Di Napoli, for example, says that Pomponazzi played the role of the theologian only to deride Christian doctrine, proclaim the absurdity of predestination, and in the end reduce the Christian God to an immoral monster. The first question we must ask – says Di Napoli – is: does Pomponazzi seriously present a theological study in the last three books of the *De fato*? Di Napoli's answer is negative: such a study would indicate full acceptance of the basic elements of faith as a mystery beyond philosophic inquiry and would then attempt to illuminate certain aspects of this faith through rational inquiry. The result would be a systematic science of faith as a sacred science which is the organization of certain aspects of faith into comprehensible formulas, not faith itself. Thus, in theory, there could be as many formulas or theologies as theologians, although the greatest theologians have made their presence felt by attracting followers and creating schools.

As Pine says referring to Di Napoli's interpretation, Pomponazzi did not proceed in this theological mode: he simply equated the Thomistic position with faith itself. And, while professing great admiration for Thomas' profundity, he proceeded to make a mockery of his conclusions calling them absurdities, involutions, and irrationalities. So, what Pomponazzi's discussion produced was a quarrel with certain theologies, notably the Thomist one, rather than an independent theological system which sought to protect the essentials of faith and illuminate certain aspects of it through dialectic. Thus, the proposal to *do theology* was for Pomponazzi a pose which allowed him to ridicule the wisdom of God by reducing it to a series of theological absurdities whose emptiness was revealed through philosophical examination (Di Napoli 1970, pp. 185–186; Pine 1986, p. 306).

More recent scholars, such as the aforementioned Pine and Perrone, have stressed, on the contrary, the complex and problematical character of the last books of Pomponazzi's *De fato*, which cannot be reduced to a mere trick to discredit the Christian theologians' attempt to demonstrate

human freedom. In fact, he never rejected the basic attributes of the Deity as given by Christian revelation: an omniscient, omnipotent Deity who freely created the universe out of His own goodness. What he vehemently excluded were all the traditional attempts to square these characteristics of the Deity with human freedom. In other words, he condemned the traditional theological formulations of Thomism, Scotism, and Ockhamism. Since none of these was the equivalent to faith, one must hold that in his exploration of Christian theology, Pomponazzi did not refuse or attack faith directly. He immodestly argued that all previous solutions to the issue of divine power and human freedom involved absurdities, which his own position eliminated. Whether Pomponazzi was successful where others had presumably failed is certainly debatable. In any case, we must grant that he made a serious attempt to save human freedom within the traditional modes of Christian theology (Pine 1986, p. 309).

Impact and Legacy

As we have seen in the biography, the *De immortalitate animae* – published in 1516 – generated an enormous scandal which made Pomponazzi not want to edit his last two works, the *De incantationibus* and the *De fato*. In spite of this polemic, Pomponazzi was never condemned, even if the *De immortalitate* was temporarily banned in the city of Venice. As Perrone has remarked, this could be proof of the fact that his fideism was perceived as sincere by the majority of his contemporaries, including some high authorities in the Roman Curia (Perrone 1999, p. xcvi).

Other scholars, on the contrary, have stressed that, by breaking the link between reason and faith so openly, Pomponazzi's fideism could hardly avoid some paradoxical consequences (Biard and Gontier 2009; Sgarbi 2010). Surely, he has left the path open for natural reason and scientific research, setting them free from all external and alien intromission. He emphasized the rigorous

order of natural laws and the natural and temporal dimension of human existence, which was demonstrated by the indivisible unity of the body-soul compound that constituted our reality and by the substantial connection between all its functions (Vasoli 1988, p. 71). But, at the same time, he belittled the fruit of that method to irremediable inferiority with regard to a truth to which it could not aspire. For this reason, some as Pine and Di Napoli have said that this fideism is simply untrue and simulated by him, only to hide the destructive results of his discourse under a conventional appearance. In this sense, Pomponazzi has been considered a forerunner of the free thinkers, especially due to the use the French Enlightenment put on him (as well as on other Italian Aristotelians). Namely, this was the conception that Ernest Renan transmitted of the Mantuan philosopher in his celebrated book on Averroism. Still, as Paul O. Kristeller has shown, it is one thing to say that Pomponazzi held the same views as later free thinkers, and another to state that he represented an earlier phase in a development that in one of its later phases was to produce the views held by those free thinkers. In the latter sense, Pomponazzi was a forerunner of the free thinkers. In the former sense, he was not: "Hence we should not praise or blame him, depending on our own preferences and values, for being a free thinker, since we lack the factual basis for either judgment. Yet in a different sense we may praise or blame him, and I am inclined to praise him" (Kristeller 1964, p. 90).

In any case, beyond the question of the real intention of Pomponazzi's thought, the truth is that he was the most original and influential sixteenth-century Aristotelian philosopher. The school to which he belonged flourished for another 100 years or more after his death, and within this tradition, his name remained famous and his views on such questions as the immortality of the soul and the unity of the intellect continued to be cited, discussed, and even admired. The posthumous publication of several of his writings later in the century also gives testimony to his continued fame. As Kristeller says, the

number of manuscripts that copied his lectures and questions was quite large compared with other professors of philosophy at the time, an indication of his popularity among his students. Moreover, the considerable number of manuscripts containing the *De incantationibus* and the *De fato* proves that these works circulated widely (Zanier 1975).

Abstract

John Ponet was a Marian exile whose political work, *A Shorte Treatise of Politike Power* (1556), laid the foundation for the development of political philosophy when it applied a secularizing perspective to bear upon the political implications of the radical Reformation tradition. Writing to encourage rebellion against the Marian regime, Ponet influentially espoused the idea that monarchs receive their authority from the people and can be deposed if they fail to secure and maintain the well-being of society.

Biography

The Right Reverend John Ponet was an English Protestant ecclesiastic whose significance as an important contributor to the development of

early modern political thought has recently been recognized and duly assessed. Born in Kent circa 1514, Ponet was educated at Queen's College, Cambridge, graduating with a Bachelor of Arts in 1533 and obtaining a Master of Arts in 1535. Ordained a priest in 1536, he became chaplain to Thomas Cranmer and archbishop of Canterbury in 1545; bishop of Rochester from 1550 to 1551; and bishop of Winchester from 1551 to 1553. When Catholic Queen Mary I (nicknamed "Bloody Mary" by Protestants) ascended the English throne in 1553, Ponet left England for Europe to escape the rule of a Catholic monarch who was antagonistic toward Protestants. In so doing, he joined the ranks of "Marian exiles" such as John Foxe, John Knox, John Bale, and John Jewel, Protestants who left England for more hospitable climes such as the Netherlands, Switzerland, and Germany. Ponet died in Strasbourg in 1556.

Ponet authored several works including *A defence for mariage of priestes by Scripture and aunciente wryters* (1549), *A notable sermon concerninge the ryght vse of the lordes supper* (1550), *A short catechisme, or playne instruction, conteynyng the summe of Christian learninge* (1553), and *A Shorte Treatise of Politike Power* (1556). An advocate of the reformed religion, he involved himself in doctrinal debates including the subject of whether priests should be allowed to marry. His *Defence for mariage of priestes* constituted a detailed defense of clerical marriage in Edwardian England.

Ponet is best known for his *A Shorte Treatise of Politike Power* (Ponet 1942), an explication of resistance theory and defense of tyrannicide. First published in Strasbourg in 1556 and reprinted in London editions in 1639 and 1642, *A Shorte Treatise* has recently attracted the attention of scholars for its contribution to the development of political thought in the early modern period (Nyquist 2013, pp. 57–91; Strier 1995, pp. 165–177). This contribution places him in the company of Reformation worthies such as Christopher Goodman (1931) and John Knox (1985) as well as George Buchanan (2004), the radical Calvinist theorist of *De Iure Regni apud*

Scotos Dialogus (A Dialogue on the Law of Kingship among the Scots) (1579) (Walzer 1965, pp. 100–109; Kelley 1988). Ponet wrote this treatise while he was in exile in Strasbourg to encourage rebellion against the Marian regime. Citing evidence from both Old Testament history and European history, he argues that it is lawful for a people to remove a tyrant from power and commit regicide, the first such polemical document in the early modern period to do so.

Ponet's radical position stems from the premise that it is the people who confer upon kings their authority to rule, which means that they also have the prerogative to revoke this authority from the ruler to whom it has been given. A tyrant can be deposed because he does not derive his authority from God. In Ponet's conception of society, the king, who is the head, is only one member of the body politic that constitutes the commonwealth. Tyranny is born when this head seeks its own desire and imposes its will on the people.

In *A Shorte Treatise*, "politike power" – the functioning of civil and political authority – is instituted by God, and its rightful exercise involves maintaining justice, defending innocence, and punishing evil, functions required for the good and order of postlapsarian society. While Ponet may appeal to biblical prooftexts to lend divinely sanctioned support to his treatise, his work also possesses a distinctively secular dimension. Ponet prizes peace, quiet, and prosperity as important signifiers of social order, arguing that a governor or king is put in place for the purpose of ensuring and maintaining the *weal* or well-being of the commonwealth (Lim 2006, pp. 30–41).

The challenging divine right theory that identifies rebellion against monarchical authority as sin, Ponet's work would be remembered in the 1640s during the English Civil Wars or Wars of the Three Kingdoms (1642–1651), a time of violent conflict between parliament and the crown that resulted in the execution of Charles I in 1649. Bringing reason, the law of nature, and divine revelation into rhetorical conjunction in constructing his argument for tyrannicide, Ponet bequeathed a revolutionary idiom to supporters of the political republic in seventeenth-century

England. Inflecting scriptural evidence of God's views on ungodly rulers through the faculty of reason and common sense, this idiom contributes importantly to the development of what today we refer to as political philosophy.

Pontano, Giovanni

Born: 7 May 1429, Cerreto di Spoleto

Died: 17 September 1503, Naples

Matthias Roick

Theologische Fakultät, University of Göttingen,
Göttingen, Germany

Abstract

Philosopher, poet, and politician, head of the Neapolitan Academy, named afterwards *Accademia Pontaniana*. Pontano was the most influential humanist in Southern Italy in the second half of the fifteenth century.

Alternate Names

[Pontanus, Johannes](#); [Pontanus, Johannes Jovianus](#)

Biography

Born in Cerreto di Spoleto, Pontano lost his father in factional strife when still a child and had to move to Perugia, where he received his education under the rhetorician Guido Vannucci. Having presented himself at King Alfonso I's camp in Tuscany, Pontano returned with the royal entourage and entered Naples in 1448, where he continued his studies and started his career in the royal chancery. In 1451, he accompanied Antonio Beccadelli, il Panormita, on a diplomatic mission to Venice. Beccadelli was Pontano's main point of reference in court, but he was also supported by a network of patrons from the Aragonese administration. Thus, he became a scribe under Giovanni Olzina, the king's first secretary, in 1452. Pontano also became the teacher of John of Aragon, the king's nephew and future Archbishop of Zaragoza, and opened a school for the sons of the Neapolitan nobility. His grammatical treatise *De aspiratione*, published in 1481, belongs to this period.

After the death of Alfonso I, Pontano took sides with Ferrante, Alfonso's son, against the

French contender to the throne, Jean d'Anjou, in the First Barons' War (1458–1464). During the war, he strengthened his ties with the Aragonese rulers, marrying the Neapolitan noblewoman Adriana Sassone in 1461 and being promoted to a more senior position in 1462. Following Ferrante's victory over his rival, he started to tutor Alfonso, Duke of Calabria, and work as his secretary. In 1466, he received a call as chancellor and professor of rhetoric in Perugia. An intervention of Pope Paul II, however, canceled his appointment. Pontano wrote his most important political works in the aftermath of the First Barons' War, including his educational letter *De principe*, the dialogue *Charon* and the treatises *De oboedientia* and *De fortitudine*. In 1471, he received Neapolitan citizenship and succeeded Antonio Beccadelli upon his death as head of the Neapolitan Academy. Under Pontano, the Academy became one of the most important humanist networks in late fifteenth-century Italy and was posthumously named *Accademia Pontaniana* (Furstenberg-Levi 2016). Beccadelli is remembered in Pontano's dialogue *Antonius*.

From 1475–1482, Pontano served as secretary to Ippolita Sforza, Duke Alfonso's wife. The 1480s were a time of unrest for the monarchy. The War of Ferrara (1482–84) and the Second Barons' War (1485–86) enabled Pontano to unfold his diplomatic talents, serving first as an envoy of the Duke of Calabria, then as a first secretary to King Ferrante from 1487 onwards. He faced the difficult task to mediate between the king and Pope Innocent VIII. The protracted conflict between the two powers came to an end only in 1492. In his dialogue *Asinus* he takes a satirical and somewhat bitter view of these negotiations. During his time as a first secretary, Pontano saw the publication of his treatises *De fortitudine* and *De principe* (1490), *De oboedientia* (1490), and his early dialogues *Charon* and *Antonius* (1491), all with the printer Matthias Moravus in Naples.

The situation of the kingdom precipitated into confusion when King Ferrante died in January 1494 and the French king Charles VIII invaded Italy in 1494–1495. Ferrante's son, now King Alfonso II of Naples, abdicated in January 1495

and fled to Sicily. In February, the Aragonese forces under his successor King Ferrante II left Naples, too. It fell to Pontano to negotiate the surrender and to hand the keys of Castle Capuano over to the French. On this occasion, he also held a speech in defense of the Neapolitans. It was probably this speech that led to later allegations of betrayal. With the fall of the Aragonese, Pontano retired from public life and returned to politics only occasionally. His last official document is a letter to King Louis XII of France in May 1503, shortly before Naples fell to the Spanish troops.

For the main part of his retirement, Pontano dedicated himself to his literary activities, however, depicted in his dialogues *Actius* (1495/99) and *Aegidius* (1501). In 1498, he published his treatises on the social virtues *De liberalitate*, *De beneficentia*, *De magnificentia*, *De splendore*, and *De conviventia*, which he had finished writing c. 1493/94. Belonging to this last phase are the treatises *De prudentia* (c. 1498/1500), the first two books of *De fortuna* as well as *De magnanimitate* (c. 1499), the third book of *De fortuna* and *De immanitate* in 1501. Pontano's last great treatise before his death in September 1503 is *De sermone*, written in 1501/02.

Heritage and Rupture with the Tradition

Pontano writes in the second half of the fifteenth century, a time in which the humanist movement in Italy reached its apogee. After a first phase characterized by the development of a new intellectual outlook and an aggressive stance towards more traditional approaches, reaching from Petrarca to Valla (Fubini 1990), Pontano participates in a second phase more concerned with consolidating the humanists' success and to further strengthening their position in politics and society.

Nevertheless, his early dialogues *Charon* and *Antonius* (Pontano 2012a) still show an aggressive stance, signaling rather infighting between different strands of humanist learning than an attack on "scholastic" authors as such. Lorenzo Valla, the main antagonist to Pontano's teacher Antonio Beccadelli, plays a crucial role here. Valla will remain a highly ambiguous *éminence*

grise in Pontano's writings. On the one hand, he criticizes Valla's militant intellectual style and rejects his radical reshaping of Aristotelian philosophy. On the other hand, he almost fully subscribes to Valla's philological method in which the discussion of the fine points of Latin style ("elegantiae") does not only concern rhetorical elegance but also implies philosophical discussions and semantics (Nauta 2011).

Later dialogues, most importantly *Aegidius* (Pontano 2013), celebrate the triumph of humanist culture, especially the creation of a new "Latin philosophy" that combines philological sensibility with philosophical acumen. Pontano's main point of reference is Aristotle. In fact, scholars of Italian Renaissance humanism have long noted the preponderance of Aristotelian thought in Pontano's treatises, although they tended to see Pontano's propensity towards Aristotle in a largely negative light: "His admiration for Aristotle never meant originality" (Vasoli 1961: 607). More recent studies argue instead that Pontano's Aristotelianism is not a trite repetition of platitudes but rather a reconfiguration of Aristotelian thought in sometimes intricate patterns and textures. He clearly continues the humanist project of taking Aristotle's writings out of the hands of the "scholastics," following in the footsteps of Leonardo Bruni and his retranslations of the *Ethics* and the *Politics*. Nonetheless, Pontano does not retranslate Aristotle but rewrites his moral and political thought, accomplishing a blend of different genres such as paraphrase, commentary, and dialogue (Roick 2017: 97–120).

Of course, Aristotle is not Pontano's only point of reference. As Pontano himself argues in *De immanitate* (Pontano 1970: 1–2), his writings combine the approaches of Aristotle, Cicero, and Seneca. Thus, the Ciceronian and Senecan influences are very pronounced in his earlier political works *De principe* (Pontano 2003), *De oboedientia* (Pontano 1518–1520: i, 1r–48v), and *De fortitudine* (Pontano 1518–1520: 49r–86v). They also show the influence of medieval authors such as John of Salisbury, Thomas Aquinas, and Giles of Rome (Cappelli 2016). First and foremost with Seneca, Pontano could hark back to the propaganda which had transformed the foreign conqueror Alfonso into the "magnanimous" ruler of

Naples, centered on Seneca's treatment of Roman monarchy (Stacey 2007; Delle Donne 2015). In Pontano, the emphasis moves from laudatory writings such as Beccadelli's *De dictis et factis Alphonsi regis* (Beccadelli 1538) to a well-founded theoretical and doctrinal approach.

In later works such as *De prudentia* (Pontano 1518–1520: i, 147r–225v) and *De fortuna* (Pontano 2012b), Aristotelian learnedness outshines the influence of Cicero and Seneca. In these treatises, Pontano develops a more general vision of man and his life, integrating his moral and political discussions mainly with cosmological explanations (Tateo 1960; Trinkaus 1985). Pontano was a specialist in astrology and the author of *De rebus coelestibus*, an astrological treatise in 13 books. He made ample use of his astrological knowledge, in his philosophy as well as in his poetry and his self-fashioning (Soranzo 2014). Regarding philosophy, this is especially the case for *De fortuna*, based mainly on Aristotle's arguments in the *Physics* and the *Liber de bona fortuna*, a compilation of the chapters on fortune in the *Eudemian Ethics* and the *Magna Moralia* (Roick 2017: 151–155). Here, Pontano also falls back on Middle Platonism and the Thomistic version of Aristotle's thought.

In other treatises, most notably the treatises on the social virtues (Pontano 2012b) and *De sermone* (Pontano 2002), Pontano goes beyond the scope of the original Aristotelian thought by painting a lively picture of the culture of his time. *De magnificentia*, for one, teems with examples of Renaissance buildings and comportments. *De sermone*, which discusses the art of pleasant conversation, gives interesting insights into courtly culture, including examples from classical and contemporary literature (Boccaccio).

Innovative and Original Aspects

At first sight, Pontano is not an innovative author. Far from the iconoclasm of Lorenzo Valla, Pontano's intellectual outlook is "conservative" in the sense that he does not want to dissolve traditional ideas by his return to the classics but to refine contemporary culture. In his treatises, he tries to reestablish and appropriate the authority of

Aristotle, explicitly arguing against Valla and his ideas of pleasure as the highest good, prudence as a mere intellectual ability, and a concept of virtue that is no longer defined as *habitus*.

Still, it would be a mistake to see Pontano as a mere epigone both to the classical tradition and to his humanist predecessors. In general, Pontano's moral and political thought reacts to major changes in the political landscape of Renaissance Italy and the moral culture of his time. From the late thirteenth century onwards, the urban civilization of the communal settlements in Northern Italy had given rise to new ruling classes, destabilizing traditional notions of moral and political authority (Ruggiero 2015). The innovative moments in Pontano's philosophical thought come to light only from this historical perspective. Like most humanists of the time, Pontano had strong ties with the new ruling class, in his case, the Aragonese. Their claim to the Kingdom of Naples was weak from a dynastic point of view. Therefore, it necessitated a strong ideological response, which was wrought by the humanists at court. Like his predecessors, Pontano shifted the discussion from mainly legal arguments to the language of virtue and wisdom. Some historians have placed this move firmly in the context of the "rise of the art of the state" and the "degeneration of politics," with Pontano exemplifying the "ideological trend connected with the establishment of princely rule over most Italian cities" (Viroli 1992: 112).

In a wider perspective, however, Pontano does not simply appropriate the new language of politics developed in the "republican" regimes in Northern Italy, adapting it to the Aragonese monarchy in the South. Instead, he rethinks the power of the ruler as well as the relation to his subjects. The key term of his analysis is *maiestas*, formulated mainly in *De principe*. It comprises a heightened sense of oneself, together with self-control and the effort to make cohere "internal" virtue and "external" representation of virtue (*De principe*, §§ 46–80). Accordingly, the "much-expanded interest in the more ritualistic aspects of princely government" (Skinner 2002: 136) coincides with a more radical understanding of the public role of the *princeps*, which involves a permanent control of his moral and political

comportment (Cappelli 2016: 95–98). Pontano's emphasis on the princes' virtues does not only reflect a laudatory stance, therefore, but also implies a kind of compact between the prince and his subjects (Cappelli 2016: 34). In *De obedientia*, Pontano continues *De principe*'s project by considering political organization as a whole, expanding his thoughts on the virtuousness of all parts of the body politic.

In contrast to his earlier works, Pontano's treatises of the 1490s and early 1500s do no longer focus on political virtue but rather investigate the role of virtue in one's personal conduct, both in terms of individual behavior and social comportment. This does not exclude political questions, as Pontano writes for a high-brow audience of nobles and functionaries. Still, the scope becomes broader.

De prudentia does not only discuss the Aristotelian virtue of prudence (*phronesis*) as such but rehearses the first books of the *Ethics* concerning the question of the best life (I) and the general definition of virtue (II). Only then does it turn to the intellectual virtues (III) and discusses the "parts" of prudence (IV), giving a long catalog of examples (V). On the surface, many of Pontano's discussions do not yield any new insights into Aristotelian virtue theory. When studied in detail, however, they reveal a surprising ability to reconfigure Aristotelian thought. Regarding the question of the good life, for example, Pontano proposes a model in which the active and the contemplative life do not exclude but complement each other during the course of one's life. Pontano's ideas on the topic are strongly inspired by his own autobiography. They clearly show to which extent philosophical thought and humanist learning had an impact on Pontano's self-perception, clearly shaping the narrative of his own life.

On a doctrinal level, Pontano reaffirms the definition of virtue as a mean (*mediocritas*) and as an inclination to act in certain ways (*habitus*). For Pontano, the mean does not so much imply a "golden mean" or the "middle way" but rather an aptness in the Ciceronian sense. Hence, it does not necessarily aim at moderation. Rather, the mean depends on the particulars of the situation. The emphasis on appropriate acts and the context of one's actions is a general trait in Pontano's

thought, and it explains why his use of examples goes far beyond the scope of mere illustration. It also helps to understand his propensity to subdivide virtues into their "parts" (*De prudentia* IV, *De sermone*) and to elaborate on the Aristotelian scheme of virtues and vices, adding new virtues such as *splendor* (magnificence on a household scale) (Pontano 1999) and discussing the nameless virtues. Thus, he terms the nameless virtue regarding ambition *ambientia* in *De magnanimitate* II (Pontano 1969).

Notwithstanding his "contextualist" or even "situationist" account of virtue, Pontano does not give up on the notion of self-cultivation and character development in his ethics. He highlights the necessity to acquire permanent dispositions (*habitus*) by a whole range of techniques of the self, including formation, regulation, and cultivation. However, Pontano is not always able to balance his insistence on the particular with his classical approach to *habitus*. Thus, he sometimes has difficulties drawing the boundaries between the intellectual virtues, especially between prudence (*prudentia*) and skill (*ars*) (*De prudentia* III). Nonetheless, he defends the status of prudence as a virtue, against Valla's arguments that prudence is a kind of ingenuity, neither good nor bad in itself. One could argue, however, that his discussion of the parts of prudence, famously including simulation and dissimulation, destabilizes the notion of prudence as a virtue. His historical examples, too, do not always work along the lines of a classical theory of virtue and include strong elements of what might be labeled as "strategic" approach.

De fortuna is a further example of Pontano's complex rewriting of Aristotelian doctrine. Here, he examines the notion of fortune from a wide range of perspectives such as Aristotelianism, Middle Platonism, Christian doctrine, and astrology. But despite Pontano's eclecticism, his argument has a specific twist to it. Central parts of the treatise propose a concept of fortune as "irrational nature," as a natural or divine impulse. Falling back on discussions of fate and fortune in Thomas Aquinas and Giles of Rome, the treatise moves between the poles of astrological determinism and a renewed belief in the powers of man.

De immanitate serves as a counterpoint, exploring the explanatory possibilities of Aristotelian moral psychology regarding “inhuman” behavior. Whereas his other treatises set positive standards, *De immanitate* seems to fathom the depths of negative human experience.

Impact and Legacy

After Pontano’s death, his works were published by his pupil and friend Pietro Summonte (Naples: Sigismund Mayr, 1505–1512). During the course of the sixteenth century, his *Opera Omnia* were printed also in Venice by the heirs of Aldo Manuzio (1518–1520), in Florence by Filippo Giunta (1520), and twice in Basle, by Andreas Cratander (1538–1540) and Heinrich Petri (1566). These reprints show that Pontano’s works were generally valued throughout Europe.

In his works, he treats many topics that will become important in the course of the sixteenth century, shaping the culture of early modern Europe. Themes such as prudence and fortune will reappear in Machiavelli’s works, although it is not clear to which extent the Florentine secretary had knowledge of Pontano’s writings (Ginzburg 2009; Robertis 2015). In the *Cortegiano*, Castiglione will make use of Pontano’s discussions on pleasant conversation; other topics such as magnificence and splendor will come to prominence, too.

Nonetheless, Pontano enjoyed long-lasting success mainly as a poet and literary scholar, while his impact as a philosopher became much more limited in later times. In Italy, his treatises came under critique rather early, mainly for their idiosyncratic attitude. They fell victim both to changes in the philological approach to Aristotle and a new trend toward writing in the vernacular (Lines 2013: 836). For transalpine Europe, the situation changes. Although we have only episodic evidence of Pontano’s influence, we know that Philipp Melanchthon held Pontano in high esteem as a humanist scholar (Pontano 1534). As Melanchthon was a crucial figure in the development of post-reformation education, it is probable that Pontano exerted a certain influence on his

treatment of Aristotle’s *Ethics*. Still, Pontano did not easily fit into a Christian version of Aristotelian morality, as a short letter on *De prudentia* by the German humanist Mutianus Rufus shows (Mutianus 1885: 383–5). Another indicator is that the Basle editions omitted *De fortuna* entirely.

There can be little doubt, however, that Pontano developed a new mainstream for early modern moral and political thought, rarely mentioned or quoted explicitly, but still strongly present in the ethical discourses of the time.

Porro, Branda

Born: 1487

Died: 1571

Silvia Fazzo

Milan, Italy

Abstract

A minor figure, no doubt, in spite of his high consideration in Milan among his fellow citizens, Branda Porro is a sample of the kind of Aristotelian scholarship in vigor when Girolamo Cardano joined the University of Pavia (*Studium Papiense*). There he was a University teacher in Philosophy, an Academic (a member of the Accademia degli Affidati in Pavia), a Catholic, and a friend of members of Milan's Senato (which governed the Università of Pavia). He left, apparently, no printed work.

Biography

Porro was Cardano's professor of Philosophy in Pavia, quoted by the latter in his works and especially in the *Theonoston*. A *Medicinae* doctor and a philosopher from a noble family in Milan, he taught Philosophy (mostly on Aristotle and Aristotle's commentators) in several places in Italy and especially in Pavia, at the *Studium Papiense* (which would be called "University" later on). He left no printed works, and no special innovation or legacy is to be found from his teaching. He can rather be taken as a sample of the kind

of Aristotelizing approach to philosophical teaching in Pavia in the times when Girolamo Cardano attended the Studium. Cardano himself, in his *De propria vita*, proudly recalls the public dispute (*disputatio*) he won against Branda, thus showing a more exact acquaintance even with Aristotle's text, which seems to have been the favorite field of his teacher. The fact, Cardano says, was recognized as true by Branda before the Milan Senate during the following days: "Accidit autem per eos dies ut Branda Mediolanum iret, res scripta erat senatui; interrogant an verum esset (It happened during those days that Branda was going to Milan; the matter was written to the senate; they ask whether it was true. A sincere and upright man, he certainly answered, it is very true.). Vir sincerus et probus, certe respondit, nimis verus est" (It happened during those days that Branda was going to Milan; the matter was written to the senate; They ask whether it was true. A sincere and upright man, he certainly answered, it is very true.). As it appears from the fact that he encountered the Milan Senate, Branda was a noble. This is confirmed by Paolo Morigi's *La nobiltà di Milano* (1595), which has a short entry with his name and praises him as "the most famous philosopher in his times" (with reference, I presume, to the Milan milieu) and as very close to the Catholic religion. This is further confirmed by the 'Impresa' (impresa being a member's designed emblem expressing his 'life's purposes') he got among the Accademia degli Affidati in Pavia, which is recalled in Contile's *Ragionamento sopra le imprese degli Affidati*. He taught, apparently, in Pisa as well (1551–1552). A minor and shadowy figure, no doubt, yet his fellow citizens would regard him as the best philosopher in his times: see AAVV *Storia di Milano*, VIII, 437, with special reference to a *Tractatus de anima* by him, where Aristotle's view is seen in contrast with Plato's. His close relationship with the Milan Senate, which governed the University in Pavia, may explain the increasing salary he was attributed year after year. The record of his academic career can be traced in Fazzo (1999) along with those of all the other teachers at the University of Pavia in Cardano's times. His works, if he had any, did not survive him. He left no printed works. Lohr (1988, p. 363), lists three *Commentaries* by Branda Porro

on Aristotle's works that have been found in manuscript form: Milano, Convento dei PP Cappuccini 5 (63), (A.D. 1551–1552), as follows: 1. In *Physicam*; 2. In *Primum De caelo et mundo*; 3. In *De anima*. Based on the given date, it seems possible that these commentaries were connected with Porro's teaching in Pisa. Due to the lack of further literature, it cannot be assessed whether the commentary on the soul is the same as to the *Tractatus de anima* mentioned above.

Portaleone, Abraham ben David

Born: 1542, Mantua

Died: 1612, Mantua

Gianfranco Miletto

Universität zu Köln, Cologne, Germany

Seminar für Judaistik, Martin-Luther-Universität, Halle-Wittenberg, Halle (Saale), Germany

Abstract

Abraham ben David Portaleone (Mantua 1542–1612), a Jewish physician and author of an encyclopedic-religious work written in Hebrew, the *Shilte ha-gibborim*, and of a Latin treatise in form of dialogue on the properties of gold (*Dialogi tres de auro*) which features epistemological considerations on the

value of human knowledge and on its relation to religion and faith.

Biography

Abraham ben David Portaleone was born in Mantua on March 18, 1542. The scion of a Jewish family of illustrious physicians, he received extensive education in both rabbinic tradition and secular sciences from the best teachers of the time like Rabbi Meir Katzenellebogen of Padua (1473–1565), Rabbi Josef Sarko (Date of birth and death unknown), Rabbi Josef Sinai and Rabbi Jacob Fano (XVI Century, exact dates of birth and death unknown). In Mantua, Portaleone studied Latin and Philosophy under Judah Provenzali and Abraham ben David Provenzali. Thanks to a Papal dispensation Portaleone graduated in medicine and philosophy from Pavia on March 22, 1563 (Colomi 1950). The Duke of Mantua, Guglielmo I Gonzaga (1538–1587), granted Portaleone the permission to be examined by a board of physicians of Mantua which unanimously on December 3, 1566, admitted him into the College of the Physicians (Archivio di Stato di Mantova, Archivio Gonzaga S III 9, 3391). On March 1, 1576 Duke Guglielmo enforced the Papal ordinances which forbade Jewish physicians to treat Christians. However, thanks to the support of several noblemen and, in particular, Count Camillo di Castiglione (1517–1598), the Duke (9/18/1577) bestowed a privilege upon Portaleone allowing him to treat all the Christians of the Duchy. Only in 1591, after long and laborious negotiations, the ducal privilege was confirmed by Pope Gregory XIV. Of Portaleone's four children, David, Lazzaro, Yehuda and Rebecca, only David continued the family medical tradition. David graduated in philosophy and medicine at the University of Padua (19/3/1597) and inherited the entire medical and philosophical library of his father including about 1000 books. (Miletto 2013).

In the summer of 1605, Portaleone suffered a paralytic stroke. He considered his illness a chastisement from God because in his youth he preferred to occupy himself “with the seductive words of the Greek wisdom,” (Portaleone, *Shilte*

ha-gibborim, p. 2b) and neglected the study of the Torah. At the end of his life, he wanted to write a religious work the *Shilte ha-gibborim* (“The Shields of the Heroes”) as a sign of his repentance and as atonement for his sins. The book was published in July 1612 shortly before his death happened.

The *Shilte ha-gibborim* is a Hebrew description of Solomon's Temple. However, Portaleone does not restrict himself to the description of the Temple complex and the cultic acts. Despite Portaleone's censure of philosophy and secular sciences, the numerous topics related to the Temple are used as a framework to deal with different aspects of the culture of his time. The mundane topics that Portaleone inserts into the description of the Temple can be summarized as follows: the Greek and Latin alphabet with other alphabets of real and imaginary languages as an introduction to the following 90 chapters; music and musical instruments (chapters 4–13), physiognomy (chapter 38) with an innuendo to the Aristotle tract *De historia animalium*, politics and administration (chapter 40), military art and weapons (chapters 41–43), gems and minerals (chapters 48–49, 54), zoology and the medical application of animals (chapters 50–53), coins and medals with their exchange rates and the price list of gems and pearls (chapters 55–56), weights and measures (chapter 72), different oils and wine types (chapter 75), different types of salt and the description of their extraction (chapter 76), and herbs, spices, and scents (chapters 78–88). Chapter 86 offers suggestions about the storage and the making of wine and vinegar, and chapter 88 describes the process of distillation. This variety of subjects show clear parallels with the contents of a *Wunderkammer* or of the *studioli* at Portaleone's time, which are more or less explicitly related to Solomon and his Temple. According to mnemonic-encyclopedic theories of the sixteenth century, particularly of Giulio Camillo Delminio (1480 ca.–1544), the Temple of Solomon was regarded as a microcosm of divine origin, representing the plastic, visual realization of the identification between science and divine word, and the architectonic exemplification of the harmonic cohesion of the variety of the creation. The seemingly contradictory mixture of religious and mundane topics is resolved in this way in the description of the Temple.

The *Shilte ha-gibborim* has been quoted by Menasseh ben Israel (*El Conciliador*, 4 vols., Amsterdam, 1633–1651), by Yom Tov Lipmann Heller (1579–1654) in his commentary on the Mishna tract *Middot* (Prague, 1614–1617) and by Rabbi Yoel Löwe (alias Brill, 1762–1802) in the introduction to the Psalms (Berlin, 1788). Portaleone was also known to Christian authors. He was one of the sources used by Johann Christoph Wagenseil in his Latin commentary on tract *Sota* (Altdorf, 1674). Wagenseil made known Portaleone to the German authors of the seventeenth–eighteenth centuries who dealt with the Temple and Hebrew antiquities like Johann Oelreich, Johann Lund, Josias Heinrich Opitz, and Johann Jakob Quandt. The chapters about music of the *Shilte ha-gibborim* were quoted by Athanasius Kircher in the *Musurgia Universalis* (Rome, 1650). Kircher made known Portaleone to several music historians of the seventeenth–eighteenth centuries like Andreas Senert (*Exercitationum philologicarum Eptas altera. IV. De Musica*, Wittenberg 1678), Wolfgang Caspar Printz (*Historische Beschreibung der edelen Sing- und Klingkunst*, Dresda, 1690), John Hawkins (*A general history of the science and practice of music*, Londra 1785), and Johann Nikolaus Forkel (*Allgemeine Geschichte der Musik*, Lipsia 1788). Biagio Ugolini translated into Latin some chapters from the *Shilte ha-gibborim* including them with the original Hebrew text (very misprinted) into *Thesaurus antiquitatum sacrarum* (Venice, 1744–1769).

Portaleone also composed a dialogue in Latin on the gold properties: *Dialogi tres de auro, Three dialogues on gold* (Venice, 1584). The dialogue is an epistemological treatise on the limits and value of human knowledge and experience.

Finally in the National Library of Paris (Bibliothèque Nationale, MS Latin 13,004), there is a manuscript with Portaleone's medical responses compiled by his son David (Berns 2011).

Porzio, Simone

Born: 1496, Naples

Died: 1554, Naples

Eva Del Soldato

Romance Languages/Italian Studies, University of Pennsylvania, Philadelphia, PA, USA

Abstract

Simone Porzio was the most important Aristotelian of his generation. He spent his life in Naples and Pisa, but he earned an international reputation for his works. As a student of Agostino Nifo, he preferred to endorse the exegesis of Alexander of Aphrodisias, though correcting it when he found it incoherent (Vasoli 2001; Del Soldato 2010a). This attitude was particularly clear in Porzio's interpretation of the *De anima* and also in his *De rerum naturalium principiis* (Porzio 1553). Other works by Porzio were devoted to ethical and theological problems and testify to the sympathy of the philosopher for heterodox religious ideas. Interestingly, these two sides of Porzio – the loyal Aristotelian and the theologian – never interfered, and he considered philosophy and faith two independent realms. Porzio was also a skilled philologist, and as a member of the Florentine Academy, he made a contribution to the literary debates of his time.

Biography

Simone Porzio was born into a prominent family in Naples in 1496. He studied in Pisa under the guidance of Agostino Nifo, with whom he returned to Naples around 1525. He began teaching at the local university in 1529, and he quickly gained the esteem of the city's intellectual elites and in particular of the Viceroy Pedro de Toledo, who named Porzio his personal physician. Despite these honors, Porzio was not satisfied with his position in Naples, where he felt restrained by the restrictions imposed by the

Viceroy on cultural life, a sentiment that was probably accentuated by Porzio's ties to members of the evangelical circle led by Juan de Valdés. In 1544 he found an excuse to leave the city and started teaching at the University of Pisa as *professore sopraordinario*, a position which granted him a high salary and a number of other benefits (Del Soldato 2010a). Porzio quickly became one of the favorites at the court of the Duke Cosimo de' Medici, who shared his interest in natural philosophy. During this period in Tuscany, Porzio began a collaboration with Giovan Battista Gelli, a respected member of the Florentine Academy, an institution patronized by the Duke and devoted to the promotion of the vernacular as a language of elevated discourse. In harmony with the program of the Academy, Gelli translated in the vernacular a wide selection of Porzio's works, especially those dealing with ethics, religion, and *miranda naturae* (Perrone Compagni 2003; Puliafito 2011; Del Soldato 2015a). Most of Porzio's books were published while he was in Tuscany, a further confirmation of his uneasiness with the repressive environment in Naples. The works published in Tuscany include the edition/commentary of the *De coloribus* by Ps.-Aristotle (Porzio 1548); the medical *De dolore* (Porzio 1551b); the *An homo bonus vel malus volens fiat*, on ethics (Porzio 1551a); and the controversial *De mente humana*, which did not cause him problems at the time of its publication (Porzio 1551c). In 1552, ill and prematurely aged, the philosopher left Tuscany for good and went back to Naples, where he spent his final days in Posillipo together with his friend Girolamo Seripando. He died in 1554.

Porzio had many students both in Naples and Pisa who became prominent university professors, but none of them endorsed the revised Alexandrism of their teacher, preferring a more traditional Averroistic allegiance: among them were Francesco Storella, Girolamo Balduino, and Giovan Bernardino Longo (Del Soldato 2010a). Furthermore, his teaching style was considered too complex and unappealing to large groups of students. Even though he did not leave behind a school, Porzio was still praised and

admired throughout Europe in the years following his death: thinkers and collectors such as Ulisse Aldrovandi, Gian Vincenzo Pinelli, Claude Dupuy, and Nicolas-Claude Fabri de Peiresc searched for unpublished works of the philosopher or even just for pieces of information about his life. Nonetheless, his posthumous reputation quickly deteriorated: thanks to a biographical legend that described Porzio as a pupil of Pomponazzi because they both propagated a mortalistic exegesis of the *De anima*, he was incorrectly reduced to an epigon of Pomponazzi (Fiorentino 1911). By the seventeenth century, Porzio's name appeared almost exclusively in association with that of Peretto. Some of the works of the philosopher, however, still enjoyed circulation. The edition of the *De coloribus* by Porzio was repeatedly published and praised even by Goethe, and the *De mente humana* was discussed by Giulio Castellani, Giacomo Zabarella, and Fortunio Liceti. The *De rerum naturalium principiiis* was reprinted in Germany and then quoted by George Berkeley, and references to the *Parva Naturalia* booklets appear in works by Giovan Battista della Porta and Francesco Lana de Terzi. The crisis and then the implosion of Aristotelianism nonetheless condemned Porzio to long oblivion, which was interrupted only at the end of the nineteenth century, thanks to the pioneering studies by Francesco Fiorentino, who had the merit of restoring and highlighting the significance of Porzio for early modern philosophy and of attracting the attention of other scholars to the "most important Renaissance Alexandrist."

Porzio's books are characterized by a rigid separation between philosophy and theology: he does not tolerate reciprocal interferences between the two disciplines, and this clear distinction makes it unnecessary for him to make an explicit appeal to the doctrine of the "double truth." It is notable that in his theological works, such as the commentary on the *Pater Noster*, Porzio never quotes philosophical sources. At the same time, in his philosophical texts, he declares his hostility toward the attempts of certain theologians to mix "different broths." In his view, both philosophy and theology share an ambiguous idea of man, a

being composed of matter and soul and therefore divided between high and low. The ambiguous nature of man represents therefore a *fil rouge* in all the works of the Neapolitan philosopher, regardless of the context he was working in: it was useful for praising the theoretical balance of Aristotle, the only philosopher capable of describing the human being in all its complexity, for confining man inside the finite and material world and, paradoxically, for allowing him to become closer to God as well. Such a double standard is particularly evident when Porzio discusses two crucial topics: the question of the soul and the human will.

Porzio's *De mente humana* is one of the most radical readings of the Alexandristic exegesis of the *De anima* and represented the culmination of reflection on the topic lasting at least 20 years. The Neapolitan philosopher affirms the mortality of the individual soul by offering a number of arguments, mostly based on an analysis of the ambiguity of human nature, divided between divinity and bestiality, which anchors men to their finite materiality. Most importantly, he corrects Alexander of Aphrodisias about the nature of the active intellect. According to Alexander the active intellect was in fact God, but Porzio finds this solution too abstract and metaphysical because it would place the active intellect beyond the sphere of the Moon. To explain a direct action of the active intellect on the possible intellect, Porzio moved it below the Moon, and he considered it a *vis* scattered in the sublunar material forms. At a certain point, he even suggests, without endorsing it, the identity of active and possible intellect. The distance from Pomponazzi's *De immortalitate* is evident, since Porzio prefers to stay completely faithful to the paradigm offered by Alexander, to the extent of making the interpretation of the Aphrodisius more coherent. Nonetheless, when discussing human will from an ethical perspective, Porzio prefers to put his mortalistic interpretation of the *De anima* aside. Making an exception to his typical hostility to any fusion of philosophy and theology, Porzio claims that the *Nicomachean Ethics* is in fact central to theology, and his reading of the text in the *An homo bonus vel malus volens fiat* has a clear theological subtext. In the

An homo, the emphasis on the ambiguity of human nature is not meant to demonstrate the mortality of the soul, but rather to justify the need for salvific grace to guide the actions of men, who cannot be absolutely free nor absolutely slaves. The implicit interlocutor of Porzio throughout the work is Erasmus, an author with whom the Neapolitan philosopher was well acquainted, as demonstrated by his commentary on the *Pater Noster* (where he seems to rely also on Valdés and the *Beneficio di Cristo*). A different approach to the problem of the human freedom is offered in Porzio's final work, the *De rerum naturalium principiis*: here Porzio comments on the first two books of the *Physics* and, while rescuing the matter from the traditional label of *prope nihil*, accepts the solution proposed by Alexander of Aphrodisias in his *De fato*, according to which fate affects humans *ad speciem*, rather than *ad individuum*, and rejects the solutions to the problem offered by theologians. The *De rerum naturalium principiis* was discussed and debated even after Porzio's death, in particular by Francesco Vimercato, and possibly influenced the thought of Giordano Bruno about matter (Badaloni 1955). The same loyalty to Aristotelian principles is present in minor works by Porzio, such as the booklets on *De puella germanica* (Porzio S.L.D.) – the explanation of an apparently miraculous fast undertaken for months by a German young girl, which the philosopher conceived while teaching the second book of the *De anima* – and the epistle *De conflagratione agri puteolani* (Porzio 1539), in which he discusses the terrible earthquake that destroyed Pozzuoli in 1537. In order to undermine astrological readings of this natural disaster, he relied on arguments found in the *Meteorology*. Porzio also wrote some short texts on love, often as commentaries to Petrarchan lyrics. The most significant of these, the *De amore*, was originally composed during the period spent in Salerno and then completed when Porzio entered the Accademia Fiorentina. These works deal with a traditional Platonic topic from an entirely Aristotelian perspective and share almost nothing with works on the same arguments composed by Porzio's teacher Agostino Nifo. These writings

were never printed, like the catalog of fishes (*De piscibus*) that Porzio began, but never finished. The *De piscibus* was intended to be accompanied by drawings by the painter Bacchiacca. Despite the fact that it was never finished and hews closely to Aristotelian schemes, the *De piscibus* puts Porzio together with Rondelet, Belon, and Aldrovandi among the pioneers of early modern zoology and attracted the interest of a young Giovan Battista della Porta, who assisted Porzio while he was collecting material for the work (Del Soldato 2008). Porzio's medical expertise is evident in texts like the *De coloribus oculorum* (Porzio 1550) and the *De dolore*: the first one intertwines anatomy and physiognomy, and the second one takes position against Galen and insists on an Aristotelian hylomorphic conception of men in order to explain the nature of pain. Porzio was also a refined philologist: he edited and translated the pseudo-Aristotelian *De coloribus* into Latin, offering sophisticated observations about the paternity of the work. However, this was no surprise: familiarity with Greek commentators and the Greek Aristotle is a feature of his entire body of work as a philosopher.

Possevino, Antonio

Born: 12th July 1533, Mantua

Died: 26th February 1611, Ferrara

Luana Salvarani

Università degli Studi di Parma, Parma, Italy

Abstract

Antonio Possevino was a Jesuit, diplomat, scholar, college founder and administrator. A very active member of his order in the core phase of its worldwide diffusion, he travelled throughout Northern and Eastern Europe as a diplomat, trying to prompt conversions and build alliances between Catholic and Orthodox countries against the Protestant Reformation and the Turks. While on the road, he established several Jesuit seminaries and colleges (Lukács 1955). Possevino is most renowned for his *Bibliotheca Selecta*, a two-volume *in-folio* bibliographic project, listing and commenting on all the works he deemed as fundamental for a complete Christian humanistic culture. Very influential in his time was a pedagogical treatise drawn from the *Bibliotheca* and translated by him into vernacular Italian, the *Coltura degl'Ingegni* (“Cultivation of Man’s Wits”), based on a

theory of natural talents governed by free will and emphasizing the educational value of real-life experiences.

Biography

Born to a wealthy but obscure family – his possible Jewish ancestry has still not been definitively proven (Donnelly 1986; Castaldini 2001) – Possevino followed the pathway of a classical humanities formation and started his career as Ercole Gonzaga’s secretary. He entered the Jesuit Order in 1559 and made his solemn profession 10 years later. He established from the very beginning good relationships with aristocrats across Europe, starting with Emanuele Filiberto of Savoy and then with the French court that entrusted him with the management of the Collège de Clermont in Paris, and he was appointed Rector of the Jesuit Colleges in Avignon and Lyon. Pope Gregory XIII charged him with important missions in Sweden – where he tried unsuccessfully to obtain from King John III Vasa, who had a conciliatory attitude to Catholicism, a formal conversion to the Church of Rome – then in Poland and Russia. He narrated his eastern travels and his meeting with Ivan IV “The Terrible” in his *Moscovia* (Possevino 1596; Graham 1977). His freedom of action inside the Order diminished after Claudio Acquaviva’s election as General and most of all after Gregory XIII’s death (1585). Possevino progressively retired in the Venetian province, even if he continued to be involved in his later years with delicate hubs in the diplomatic network of the church, such as the Venetian Interdict crisis, exchanging letters with the English ambassador Henry Wotton and writing pseudonymous controversies against Paolo Sarpi. Some of his letters (e.g., ARSI OO.NN. 333) show his resentment about his being confined between Mantua, Padua, and Venice (and later Ferrara), after his globetrotter life and his privileged relationships with the earlier Jesuit General Mercurian and the pope. When he died at age 77, the Jesuit Order had already reinforced its hierarchical and institutional structures, losing the experimental character of its first decades, and

had fully assumed the role of bastion of orthodoxy. This was the role Possevino had faithfully performed during his entire life but had also endlessly questioned and interpreted in a very flexible and sometimes independent way.

Innovative and Original Aspects: Impact and Legacy

Possevino's philosophical profile, as expressed by his choices in the *Bibliotheca* and by his declarations in the *Coltura*, was quite original (Possevino 1593). Drawing on Ficino's and Pico's Platonism, Cappadocian theology, and Christian kabbalah, it made for a problematic synthesis with developing Jesuit Aristotelianism (Casalini and Salvarani 2008). This as well as his unassuming death – so unlike the martyrdom of so many of his contemporary Jesuit brothers – may well account for his relative popularity. Nevertheless, the influence of his educational ideas, on whose basis he managed his colleges, was visible for decades after and contributed to the overall profile of the seventeenth-century Catholic man of letters. He stands as a lively example of the cultural complexity and intellectual freedom of the early Jesuits.

Abstract

Guillaume Postel (1510–1581), primarily known as a Christian Kabbalist, was a sixteenth-century polymath, an eclectic scholar and philosopher, a self-taught linguist and geographer, a Jesuit, and a heretic. He held the first chair of Arabic in Europe, and he is

often considered the first European Orientalist. With his works, he has indeed contributed to renovating the representation of Islam in the Western culture, exploring and describing the Ottoman society and tradition. He has enlarged the scope of the fifteenth-century humanistic interest in the Hebrew language and the Jewish esoteric tradition. As a traveler and wandering scholar, he established relationships with literati from all over Europe, becoming their friend, master, and collaborator. Along with Orientalism, he has offered an invaluable contribution to early modern universalism as well. In a period of transition such as the sixteenth century, Postel was a child of his time, proclaiming himself a prophet, a New Elias, and announcing the forthcoming Age of Restitution, the Fourth Age of Man, i.e., the realization of a global religious and political unity of all people.

Biography

Born in Normandy, close to the small village of Barenton, in the hamlet of La Dolerie, in 1510, Postel lived his early life in France, as a teacher in a village near Pontoise, Sagy, and then in Paris. He was an orphan of humble birth and suffered from severe illness during his first years in Paris (Thevet 1584). After a brief spell near Chartres, working at a farmhouse, Postel attended the Collège Sainte-Barbe of the University of Paris. A leading center in geographical studies, the Collège was strictly connected to the Portuguese Kingdom and the Spanish cultural milieu, thanks to its director, Diogo de Gouveia, to whom Postel was presumptively close (Baghdiantz McCabe 2008). During his stay at the Collège Sainte-

Barbe, Postel gained knowledge about geography – an overlooked interest of Postel’s philosophical production, despite the fact that he drew a world chart (Grendi Milanese 2011) and wrote on cosmography (Destombes 1985). But, above all, he learned various languages. The study of ancient and oriental languages, and in particular of Hebrew – conceived as the original language – played a fundamental role in Postel’s conception of global harmony and universal monarchy. Moreover, Postel was able to teach himself Spanish and Portuguese just by listening to students speaking at the Collège (Thevet 1584). He already mastered Greek, and once at the service of Jean Gelidius, an Aristotelian humanist at the Collège, he helped him with lessons and the translations of Themistius’s *Commentaries* on Aristotle. Although Jews were expelled from France already in the fourteenth century, Postel learned Hebrew thanks to a Jewish family that still resided in the neighborhood: they lent him a grammar book and a Hebrew-Latin *Book of the Psalms* (Thevet 1584). In those years, he became interested in Arabic as well; as a result, the King of Portugal, John III, offered him a chair in Lisbon, a position Postel refused to pursue his studies. We also have traces of an epistolary exchange with the Portuguese humanist Damião de Góis about their shared desire for reform (Kuntz 1981). It was during these years that he came into contact with Ignatius Loyola, who arrived at Sainte-Barbe in 1528, where he gathered his first companions. Loyola’s proselytism, zealous spirit, and spiritualism made a lasting impression on Postel: indeed, in 1544, he joined the Society of Jesus (1540) in Rome, albeit for less than 2 years. Nevertheless, it would be incorrect to make Postel’s thought and the Jesuit spirit coincide. Postel’s political vision, philosophical-religious universalism, and self-proclamation as a prophet mark a clear boundary between him and Loyola’s order.

In 1536, Janus Lascaris sponsored Postel to the French Crown to make him be part of Jean de la Forêt’s company, the first official French embassy at the court of Sultan Süleyman the Magnificent. With this delegation, King Francis I attempted to secure an alliance with the Ottoman Empire against the Hapsburgs and Emperor Charles

V. During the expedition, Postel was formally in charge of recovering the treasure of a dead French jeweler from Tours, which the man had brought from India and had partially sold to the Grand Vizier of Süleyman, Ibrahim Pasha (Kuntz 1981). The unfortunate result of this mission notwithstanding, crossing the Mediterranean, from Tunis to Egypt and Istanbul, Postel collected manuscripts for the royal library of Fontainebleau and had the chance to pursue his study of Arabic and learn Turkish for the first time. In some of his published works, the French Orientalist reports his impressions of the Ottoman society and the way he learned Arabic from a local, who showed him the passages in the Qurʾān which referred to Jesus Christ. He declares that the Ottomans compared him to a demon, for his talent and fastness in learning Arabic, professing himself to be satisfied by having become capable of speaking anywhere, without the help of an interpreter.

After his first voyage to the Ottoman Empire, he published in Paris *De originibus seu de Hebraicae linguae et gentis antiquitate* (Postel 1538a) and *Linguarum duodecim characteribus differentium alphabetum, introductio, ac legendi modus longe facilimus* (Postel 1538b). In the first treatise, following a humanistic pattern, Postel recognizes in Hebrew the primordial language, the most precious gift of God to Adam (Simoncelli 1984; Kuntz 1997), demonstrating it through examples and fabricated Semitic etymologies, which Postel has defined as “emithologies” (Secret 1958). In the second book, he collects the alphabets of 12 different oriental languages, reconstructing the pronunciation of letters, giving examples of translation, and confirming the Hebrew derivation of them all. In 1537, on his way to Paris, Postel stopped in Venice. There, he met the Antwerp printer Daniel Bomberg and the former Hebrew teacher of Giles of Viterbo, Elias Levita, with whom Bomberg was working on the *Books of Job and Daniel*, as well as Teseo Ambrogio (Postel 1538a). Ambrogio was the first European scholar of Syriac, teacher of Johann Albrecht Widmannstetter. Postel met the German scholar in Rome almost 10 years later and collaborated with him on the *editio princeps* of the Syriac New Testament (1555). To Ambrogio,

who published in 1539 his *Introductio in Chaldaicam linguam, Syriacam, atque Armenicam, et decem alias linguas*, Postel asked the types to print the Arabic and Armenian letters in his *Linguarum duodecim characteribus differentium alphabetum, introductio*. At this stage, although the French scholar remained in Venice for less than a month, it becomes evident that Postel established significant intellectual connections with the Venetian humanistic circles (Kuntz 1988). Through them, moreover, he entered in contact with the Roman group formed around the Hebraist Giles of Viterbo, presumptively getting acquainted with the ideas of the Florentine Neoplatonists, too.

Back in Paris, in 1538, King Francis I appointed Postel *lecteur royal* to the chair of Greek, Arabic, and Hebrew at the Collège Royal, founded under the recommendation of the humanist Guillaume Budé. The establishment of this royal college displays the political struggle between the French Crown and the Roman Church in the monopoly of production, organization, and regulation of knowledge. Indeed, concurrently with the declaration of French as the national language, the teaching of oriental languages by professors paid directly by the monarchy, in an institution independent of the Sorbonne, and before the Vatican Sacred Congregation for the Propaganda Fide, was a remarkable, culturally revolutionary act (Baghdiantz McCabe 2008). In particular, Postel held the very first chair of Arabic in Europe. The urgency of teaching Arabic, Greek, Hebrew, and Syriac and the institution of the related chairs in Bologna, Paris, Oxford, Avignon, and Salamanca had already been declared at the Council of Vienne (1311–1312), under the tenacious pressure of Ramon Llull’s educational and missionary ideals (Southern 1962). However, it was never put into practice before Postel’s appointment. From 1541 to 1543, Postel’s patron, Chancellor Guillaume Poyet, fell into disfavor with Margaret of Navarre, the King’s sister, and was imprisoned in the Bastille. Between 1540 and 1541, Postel found support in the Bishop Bouvery, close to Poyet and patron of Jean Bodin. Despite the troubles suffered by Poyet, Postel was extremely prolific (Secret 1970; Postel

1992). He was able to produce and publish several works, and write in just two months his main oeuvre (Bouwsma 1957), *De orbis terrae concordia libri quatuor* (Postel 1544). Once completed, Postel submitted this work to the theologians of the Sorbonne for approval; several months later, it was returned to him carrying the label *ad facultatem non pertinens*. He eventually published it in 1544 in Basle at Oporinus' printing house, which had already re-printed his *De republica, seu magistratibus Atheniensium* (1541). For the Basle edition, Postel decided to remove the final section because of the harsh criticism against the Protestants it contained. He printed it separately as *Alcorani seu legis Mahometi et evangelistarum concordiae liber* (Postel 1543).

The very structure of the *De orbis* demonstrates the consistency of Postel's production and interests: the role played by linguistic studies in the construction of a universal concord is extensively specified. Indeed, according to Postel, the recovery of oriental languages allows discovering the hidden correspondences between the Bible, the Qur'ān, and the Gospels, through the reading of *testimonia ex variis linguis* (De La Cruz Palma 2015). Thus, the study of languages shapes and defines the unity under a unique God, in a single *Ecclesia*. Although Postel conceives the religious unity between nations as a global concord under a Christian vessel, the Christian identity is renovated according to humanistic ideals. Refutations notwithstanding, he generally adopts a somewhat proto-tolerant view. Postel firstly judges ancient Judaism as the very heart of Christianity, he establishes a historical derivation of the Ottomans from the Jews (Lestringant 1985), and recognizes a shared identity between Muslims and Christians. Secondly, he describes the veneration of and the love for God as a natural and universal fact, based on the rational and intellectual instruments common to all humankind. On this very basis, he proclaims a global political union, under the French Crown, forecasting and laying the ground for Jean Bodin's political thought. Most of Postel's vision was deeply inspired by his first voyage to the Ottoman Empire and reveals that Postel was

influenced by, among others, Nicholas of Cusa, Marsilio Ficino (Kristeller 1988), Pico della Mirandola, and Annius of Viterbo. In this period, Postel already proclaimed himself a prophet of a new time and, presumptively, in this sentiment lies the reason why he warned King Francis I for an urgent reformation of his court, his people, and the entire world. Postel defends his political argument of the historical primacy of the French: descendants of the Galls, they are direct heirs of Noah's sons, as demonstrated, in parallel, by the direct derivation of French from Hebrew (Dubois 1972). Furthermore, *De orbis* and its messianic globalism establish a long-lasting relation with the religious and intellectual milieu of Basle, showing a specific inter-confessional dimension of the religious debate of the time in Europe (Rotondò 1974). Although Postel blames the Protestants, whom he calls *cenevangelistae*, and negatively compares to Muslims, the French scholar maintained close relationships with many of the Basle *literati*. In addition to Oporinus, Postel sympathized with Philip Melancthon's ideology and became friends with the Zurich Orientalists Konrad Pelikan and Theodor Bibliander, the editor of the first Latin printed edition of the Qur'ān (1542–1543), who undoubtedly shared an irenic ideology with Postel.

In 1544, dismissed from his position in France, Postel went to Rome and joined the Society of Jesus, until December of the following year. In the papal city, he met an Ethiopian priest, with whom he discussed the *Book of Enoch*, and Johann Albrecht Widmannstetter. Alongside their collaboration on the Syriac New Testament, thanks to Widmannstetter, a friend of Giles of Viterbo, Postel became more interested in Kabbalistic studies, on which research studies on Postel have almost predominantly focused (Secret 1981, 1998; Kuntz 1981; Weill 1987; Matton 2001; Petry 2004). In 1546, Postel wrote *De restitutione humanae naturae*, which he tried unsuccessfully to send to Oporinus. Possibly intercepted for its unorthodox opinions by apostolic authorities, this book was later incorporated in the *Restitutio rerum omnium* (1552). In Rome, Postel got acquainted with the Papal Vicar Filippo Archinto,

who showed an interest in Postel's oriental and esoteric studies, and with the Flemish scholar Masius (Andreas Maes). A Hebraist himself, Masius became a disciple of Postel in Arabic.

Between the end of 1546 and January 1547, Postel was back in Venice, where he remained until the summer of 1549; this period was crucial for the further development of Postel's messianic globalism. He indeed encountered the Venetian Virgin or True Mother of the World, whom Kuntz has eventually identified with Mother Johanna, or Madre Zuana (Kuntz 1981), an elderly woman who assisted the poor and indigents at the Ospedaletto of Saints John and Paul, where Postel served caring for people in need of spiritual guidance. Mother Johanna was not only a pious lady but also a mystic; Postel became her confessor, her spiritual father, and at the same time, her spiritual son, making her both his mystical daughter and spiritual guide. The ideal proclamation of a forthcoming Fourth Age of humankind, the Age of Restitution, the Sabbatism, was drastically confirmed to Postel by the prophetic encounter with the Mother of the World. She would have been the New Eve, the earthly embodiment of the sefirah *Shekhinah*, who would have restored the global unity between all people, spreading the ancient mysteries preserved by the ancient sages (*prisci theologi*) to renovate the True Religion. With the older, unlettered woman, Postel read the *Zohar*, of which he providentially (according to him) got hold. He stated that he had explored the hidden *arcana* of the text and had discovered in it, thanks to Mother Johanna's inspired comprehension, the confirmation of the venue of a new Angelic Papacy, that of Mother Johanna. In this period, Postel also succeeded in seeing some of his works published, such as his *Absconditorum a constitutione mundi clavis*, *De nativitate Mediatoris ultima*, and *Πανθενωσία* in Basle, by Oporinus, in 1547, and the Latin translation of his *Candelabri typici in Mosis Tabernaculo [...] interpretatio* (Postel 1548; Postel 1966) originally written in Hebrew. Then, he started translating the *Sefer ha-Bahir* and the *Sefer ha-Zohar*. Oporinus received Postel's translation of the *Bahir* and its apology

(*Dell'apologia*) in 1549, but he never published either his *Bahir* or his *Zohar* (Rotondò 1974).

In 1549, Postel departed again for the Ottoman Empire, joining the embassy of Gabriel d'Aramon, in which officially participated André Thevet, among others. The purpose of the ambassador was to prevent a possible alliance between the Sultan and Charles V after the Franco-Imperial Treaty of Crépy (1544). During this second voyage, traveling across the Ottoman Empire, from Anatolia to Persia, from Syria to Egypt, Postel collected rare books and manuscripts, especially Arabic works on science, astrology, and medicine, as well as Syriac and Arabic copies of the New Testament. This itinerary, of which Postel provides several details in letters to Masius and the Cardinal de Granvelle (Wilkinson 2007), is a rare example of knowledge and material transfer across the Mediterranean from the East to the West. The books and manuscripts he bought, despite his financial difficulties, later served as the core for oriental funds and collections in the major European libraries, and they were essential to the development of European oriental studies.

After this voyage, Postel published books on the Ottoman culture, such as *De la république des Turcs* (Postel 1560a) and *Histoire et considération de l'origine, loy, et coustume des Tartares, Persiens, Arabes, Turcs, et tous autres Ismaélites ou Muhamediques, dicts par nous Mahometains, ou Sarrazins* (Postel 1560b). Even though he composed these works after his second crucial voyage to the Ottoman Empire, these texts are based on Postel's records of his first voyage (Isom-Verhaaren 2017). Back in Europe, presumptively in August 1550, Postel stopped in Venice and discovered that Mother Johanna was deceased. During this very short sojourn, Postel consigned rare manuscripts to Bomberg and worked on the Syriac New Testament. Once in Paris, Postel was received at the new court of King Henry II, where he enjoyed the favors of his sister Margaret of Valois, to whom Postel dedicated *Les très merveilleuses victoires des femmes du nouveau monde* (Postel 1553). On January 6, 1552, Postel experimented with the "immutation," the

mystical union with the Mother of the World. Mother Johanna's spirit descended into his body, restoring the union between the male and female principles in his spirit and making him rise from the ashes as a new man, son of Christ and Mother Johanna (Kuntz 1981). The proclamation of his new birth and of the restoration of humankind in a new era caused his definitive estrangement from the French court. He consequently left France, arriving in Basle in June 1553, where he found generosity and friendship in Oporinus and Bibliander. He supported Servetus's ideas against Calvin; in 1555, presumptively in Padua, he wrote his *Apologia pro Serveto Villanovano*. Postel significantly established a lasting friendship with Theodor Zwinger, his future correspondent, Caspar Schwenckfeld, and, possibly, with Sebastian Castellio and David Joris. In August 1553, Postel was back in Venice, hosted by the printer Giunti, and, thanks to Moses of Mardin and his manuscripts, he worked on the Syriac New Testament. He furthermore offered a substantial contribution to Widmanstetter's edition, who at the time was in Vienna and welcomed there both Mardin and Postel.

Postel was obliged to leave Vienna in May 1554: the Venetian Inquisition included some of his books, such as his *De nativitate Mediatoris ultima* (Postel 1547), in the Index of the Prohibited Books. Back in the city, Postel asked for an audience at the Inquisitional Tribunal. In financial troubles, Postel was forced to ask for Masius' help in selling some of his oriental books to the Elector Palatine, Duke Ottheinrich. After the first inquiry, in 1555, Postel wrote and printed two more books, presumptively in Padua, as we know from the report of the Holy Office's procurator (Kuntz 1981), on the topics of his "immutation" and the mysteries of the Mother of the World. Postel was interrogated and imprisoned in the *cason* at Santi Apostoli, i.e., the Venetian prison in the *sestiere* Cannaregio, for the publication of *Il libro della divina ordinatione* and *Le prime nove del altro mondo* and their content. On September 17, 1555, despite Postel's denials, the Holy Office irrevocably

judged Postel a mad and delirious man, whose fanatic ideas were dangerous and heretical (Postel 1972). After that, he was charged with life imprisonment in Rome, and his suspected books were condemned. Kuntz (1981) has observed that the sentence of madness may have been released to save his life from a death condemnation. Benjamin Nehemiah ben Elnathan from Civitanova Marche was later confined in the same papal prison in Rome, and the chronicle he kept gives us substantial details of Postel's imprisonment (Secret 1965). Upon the death of Pope Paul IV (1559), all prisoners were freed; in the same year, Postel eventually saw his *Zohar* in Aramaic published in Cremona, and, from this version, he began to work on a second Latin translation. He unsuccessfully tried until his death to get the Latin text published, as his letters to Zwinger document. After his liberation, Postel went to Cremona, Basle, Venice, and Trent, hoping to encounter the delegates of the Council to expose his ideas against papal supremacy and then to Augsburg. In 1562, he settled down in Lyon, where a lawyer accused him of planning the substitution of Christians with Muslims and having formed a rebellious movement, the *Postellisme*.

Then, he returned to Paris, where he attempted to teach in public; eventually, he was incarcerated in the Monastery of Saint Martin des Champs for 3 months because of the demonstrations he nurtured. Charged, as in Lyon, with the organization of the *Postellani* – an accusation he vehemently denied –, Postel was grabbed from Joseph Scaliger's house, where he had found refuge. Despite his efforts to find support from Queen Catherine de' Medici, he was confined to the Monastery in 1564. However, it seems that he enjoyed some freedom during his detention: for example, in 1566, he was in Laon, where he assisted in the exorcism of a young woman. Postel interpreted this event as a miracle, recognizing it a sign of the Age of Restitution, as he explained in later books signed under several pseudonyms, such as Rorispergius – the most significant –, Petrus Anusius Venetus, Petrus Anusius Synesius, and Jehan Boulaese or Boulese (Kuntz 1981).

During these years, moreover, thanks to the mediation of his close friend Masius, he extensively contributed to the publication of Plantin's Antwerp Polyglot (1568–1573). Although Postel's name does not appear in the preface, most of the people involved were his disciples or friends.

He died in Paris, in the Monastery, on September 6, 1581.

Practical Knowledge

Eric H. Ash

Wayne State University, Detroit, MI, USA

Abstract

The incorporation and elevation of practical knowledge were one of the most important innovations in Renaissance natural philosophy. Manipulating nature for productive ends came to be seen as a principle means of studying the natural world and the ability to do so as the best evidence that a true understanding had been achieved. As improving the human condition through the acquisition of practical knowledge gradually became a vital goal of pursuing natural philosophy, the social and intellectual status of those who possessed it was enhanced through their association with elite patrons and power brokers. At the same time, those elite patrons increased their own power and status by harnessing their clients' practical knowledge, both to enrich themselves and to bolster the power and legitimacy of the burgeoning early modern nation-state.

Heritage and Rupture with the Tradition

Dating from ancient Greece, various types of human knowledge had long been understood and classified hierarchically, based on the degree of philosophical certainty they possessed. At the top of the hierarchy was *episteme*, a theoretical form of knowledge rooted in immutable philosophical ideas and acquired through logical reasoning, deduction, and mathematical demonstration. *Episteme* was considered the least contingent and therefore the most certain type of knowledge, the bedrock upon which a true natural philosophy should be based. At the bottom was *techné*, which was acquired through sensory interaction with physical things in an

ever-mutable material world. *Techne* was practical knowledge and was certainly valuable in terms of material production, but because it was rooted in the contingencies of the physical world, it was too uncertain to have any philosophical value – it could not reveal any underlying truths about nature. The relative value of each type of knowledge was likewise attributed to those who possessed it, with contemplative philosophers enjoying a far greater intellectual status than mere artisans and craftsmen, who could productively manipulate nature but were held to have no philosophical understanding of it.

With some notable medieval exceptions (particularly in alchemy), this hierarchy of knowledge persisted until the Renaissance, when the philosophical value of practical knowledge began to be reassessed. Many philosophers came to believe that artisans actually learned a great deal about the natural world through their physical manipulation of it and that their knowledge was capable of real certainty despite being derived from mutable, material things. Some even advocated that natural philosophers should make a point of acquiring practical knowledge themselves, as a necessary and revealing complement to their logical deductions and mathematical reasoning. At the same time, some learned artisans worked to enhance their intellectual reputations, writing books in an effort to codify and systematize their knowledge for a more philosophical audience. A fruitful interaction developed between philosophers and artisans, giving rise to a new, more practically minded natural philosophical method.

Impact and Legacy

The philosophical turn toward practical knowledge became a hallmark of the new natural philosophy that emerged in sixteenth- and seventeenth-century Europe. Though he was certainly not alone, the most influential philosopher in this regard was Francis Bacon (January 22, 1561 – April 9, 1626), who argued that

inductive, experiential knowledge was the only appropriate basis for building a natural philosophy. Bacon believed that acquiring practical knowledge was both a means and an end in studying the natural world: the ability to manipulate nature for productive ends, he suggested, was the best possible evidence that the philosopher had gained a true understanding, while improving the human condition was the most important reason to study nature in the first place. The Baconian method was deeply influential in natural philosophy throughout the seventeenth century, inspiring the early members of the Royal Society, among many others.

Beyond its new-found philosophical value, the great material value of practical knowledge attracted the interest of monarchs, royal ministers, and other elite patrons, who wished to gain control of such knowledge for their own ends, and offered their patronage to those who claimed to possess it. Practitioners put their skills and knowledge in the service of such patrons, enhancing their own intellectual and social status through the association, while their savvy patrons added to their own wealth and power in harnessing a wide range of productive knowledge. The burgeoning nation-states they served, meanwhile, also gained greater power and legitimacy through their growing ability to manipulate the natural world.

Predestination

► Fate, Renaissance Concept of

Predestination in Renaissance Philosophy

Antonio Gerace

Research Unit of History of Church and Theology, KU Leuven, Leuven, Belgium
Fondazione per le scienze religiose “Giovanni XXIII”, Bologna, Italy

Abstract

This entry deals with the concept of predestination, as it was developed in Christian debates in the time of the Renaissance. First, a brief philological introduction will be given, to show the origin of this debate. Second, Augustine's view of predestination will be examined. Thereafter, the focus will be devoted to the centuries XIV–XVII, first analyzing John Wycliffe and Jan Hus, then Luther and Calvin, Jacob Arminius, the inner-Catholic debate of the so-called “*de auxiliis* controversy,” and finally turning to competing conceptions of God's grace within three schools of Roman Catholic thought: the anti-Pelagian, Augustinian-minded school in the Spanish Netherlands – which later lead to Jansenism – the Thomist-Bañezian School in Spain, and the Jesuit Molinist school. In the course of the treatise, the difference between supralapsarianism and infralapsarianism will be clarified. Moreover, it will be necessary to consider several notions that are tightly linked with predestination, such as “grace,”

“foreknowledge,” “merit,” “free will,” “election,” and “vocation.”

Introduction

The theological problem of predestination, and the possibility (or impossibility) of human free will, has been debated since the beginning of Christianity. The opposition between Catholicism and Protestantism in the modern era was only one manifestation of this centuries-old debate, which also saw the opposition of, for instance, Augustine (Thagast, 354–Hippo, 430) and Pelagius (c. 360–418) in early Christianity, and Gottschalk of Orbais (c. 805–c. 868) and John Scotus Eriugena (c. 800–c. 877) in the Early Middle Ages. One of the results of this debate was the elaboration of two opposed theories of salvation. On the one hand, Pelagianism asserts the possibility for men to attain salvation on the basis of personal merits without the assistance of divine grace. On the other hand, Calvinism, with its doctrine of double predestination, makes a clear distinction between those whom God has already saved and those whom God has already damned from all eternity. Catholicism takes an intermediate position between these opposed theories, although it has also seen an internal debate in the sixteenth century regarding the respective roles played by God’s grace and human free will – one which produced a polarization between the Thomist and the Augustinian-minded traditions on the one hand, and Molinism on the other. The origin of these discussions was the use of the verb προορίζω (*proorízo*), literally “to determine before” in the New Testament, a term that appears just five times in the Pauline corpus (Rm. 8:29; Rm. 8:30; 1 Cor. 2:7; Eph. 1:5; Eph. 1:11) and once more in the Acts of Apostles (Act. 4:28). This “before” in which God determines is the a-temporal dimension that precedes the creation of the world. The term, *proorízo*, was then translated in Latin as *praedestino* and in English as “to predestine.” The theological analysis of this verb seemed to be liable to different interpretations, since the effect of such predetermination could be the

annihilation of human free will. This led to several distinct and even opposing Christian schools of thought. The moment in which God predestines is a matter of discussion between two opposite factions: first, the infralapsarians, also known as postlapsarians or sublapsarians, who affirm that God by His foreknowledge saw Adam’s sin and allowed him to fall. After this original sin, God predestined men, bestowing His grace. Second, supralapsarian or antelapsarians, who maintain that God predestined men before Adam’s fall. The latter view totally refuses an active role of human beings in their path to salvation, while the former potentially leaves space for men’s free will.

Augustine’s View on Predestination

In one of his last writings, *The Predestination of the Saints*, Augustine furnishes a complete analysis of predestination. He first clarifies the difference between grace and predestination, arguing that the latter is preparation for grace, while grace is the gift itself. Hence, “the grace is effect of this predestination” (Augustine 1962: 10.19). Second, Augustine says that predestination depends on foreknowledge (*prescientia*). If there is predestination, there is foreknowledge, but not vice-versa: if there is foreknowledge, this does not mean that there is also predestination. Actually, God foreknows what he predestines, what he will create, but he also foreknows those things that do not depend on his will, such as sins. While he foreknows them, given his omniscience, he does not predestine them; otherwise, this would have the absurd consequence that God is the cause of men’s sins. Although sinners act against God’s will, they accomplish God’s will: they act against God’s will by sinning, but the effects of their sins are not in their power, for this is the effect of God’s will. In other words, only men are the cause of their sins, but God is the cause of the effects of those sins. Since God predestines from eternity and bestows his grace in time, men achieve no merits in obtaining salvation. “Grace” itself indicates what is freely given. Two reflections should be made. First, men who

are predestinated from eternity and receive grace in their lifetime are free, and their will is free. According to Augustine, freedom is to be understood not as the possibility to choose to do *a* or *not-a*, but instead as “freedom from sins.” In this perspective, a person who sins is a slave of sin; hence, human will is free only if subjected to grace and not to sins. Second, God predestines through vocation, but Augustine distinguishes two kinds of vocation: the first not efficacious, as that of the Jews that refused Christ; the second efficacious, “according to (his) purpose (*propositum*)” (Augustine 1962: 10.19). The latter vocation is addressed only to the elects, who were chosen not because they have believed – so for their merits – but in order that they could believe – so by grace. Therefore, in Augustine’s view, God foreknows his creation and predestines before creation those who will receive grace by means of vocation, choosing them on the basis of his own purpose. Starting from these premises, theologians and philosophers developed further Augustine’s view on predestination, marking out three major lines of thoughts: first, a fatalist or determinist model, in which God predestines to both damnation and salvation, the so-called double predestination, which excludes any human concurrence in the economy of salvation; second, a less strong model in which God predestines men to salvation, but not to damnation; and third, a model in which God predestines all men, bestowing his grace on everyone, but leaves it to man’s decision to positively answer His vocation.

John Wycliffe and Jan Hus

John Wycliffe (Ipreswell, 1331–Lutterworth, 1384) and Jan Hus (Husinec, c. 1371–Constance, 1415) were two promoters of the second model: God determines those who reach eternal salvation, but not damnation. He foreknows their sins, but He allows those sins. Actually, Wycliffe calls the former “predestined,” and the latter “foreknown” (Levy 2006: 355). Concerning the predestined, he writes: “predestination is God’s chief gift most freely given, since no one can merit his own predestination”, and grace “cannot be lost, since it is the foundation of glorification or beatitude, which

cannot be lost either” (trans. Levy 2006: 223). The Bohemian Jan Hus, although following Wycliffe, stresses the importance of acting well, as a sign of having been predestined (Leff 1986). According to them, the “Church” is the set of predestined people, but it determines “the denial of any visible identity of the church” (Leff 1986). This principle had political consequences: because there is no necessity to assume an identity between the church as a set of Christians and the Church as an institution, it denies the legitimacy of the Church as an institution. Hus wrote during the time of the Western Schism (1378–1417), in which the Roman Church suffered an internal division resulting in the simultaneous presence of three Popes in three different sees: Rome, Avignon, and Pisa. This situation was later solved during the Council of Constance (1414–1418), during which Jan Hus was sent to the stake as a heretic.

Luther and Calvin

The question of predestination was later a subject of discussion in the Reformation era. Martin Luther (Eisleben, 1483–Eisleben, 1546) never wrote an exhaustive treatise on the matter, but in his *On the Bondage of the Will* (1525), he describes the necessity of God’s will and also the necessity of His foreknowledge. Moreover, he recovers Augustine’s concept of human free will, which is free because it subjects to God’s grace and not to sins. Luther describes human will as a horse with two riders, Satan and the Holy Spirit. Man could not choose to act well or badly, but instead acts on the basis of the presence or absence of grace in him (Luther 1823: 62). Since God foreknows and wills necessarily, Luther seems to accept a “double predestination,” but John Calvin (1509, Noyon – 1564 Genève) developed this doctrine much further. The French theologian actually maintains that God, from eternity and only according to his own judgment decrees who is to be saved and who is to be damned. In his *Institutes of the Christian Religion* (1536), the Reformed theologian actually writes: “God by his eternal and immutable counsel determined once for all those whom it was his pleasure one day to admit to salvation, and those whom, on the

other hand, it was his pleasure to doom to damnation. I maintain that this counsel, as regards the elect, is founded on his free mercy, without any respect to human worth, while those whom he dooms to destruction are excluded from access to life by a just and blameless, but at the same time incomprehensible judgment” (Calvin 1962: II 201-1). For Reformed theologians, predestination is therefore God’s eternal decree to bestow an irresistible grace on people whom He had chosen from eternity. This doctrine is, therefore, to be considered supralapsarian, since God decrees a person’s doom before Adam’s fall. This doctrine is also called “unconditional election,” since God decrees a person’s doom only according to His own will, without being “conditioned” by a man’s use of his free will. God bestows his grace at once, and this grace is “irresistible.” Those who receive such grace could never lose it; it leads them inevitably to eternal life. Calvin’s idea of double predestination was later promoted by his successor in Genève, Theodor Beza (Vézelay, 1519 – Genève 1605). This view on predestination was also later accepted and codified by Reformed churches in the Belgian Confession (1561) written by Guido de Brès (Mons, 1522 – Valenciennes, 1567).

Debate Within Reformation: Unconditional Election versus Conditional Predestination

Jacob Hermandszoon (Oudewater, 1560 circa – Leiden, 1609), best-known as Arminius, was a Calvinist theologian who took his distance from Beza’s interpretation of Calvinism, trying to save individual free will. His view soon diverges from Calvin’s supralapsarian double predestination, proposing instead an infralapsarian “conditional predestination.” This is the doctrine that predestination becomes effective after a believer’s free and positive answer to God’s grace, while rejection is due to a person’s free refusal of it (Stanglin 2007: 84). Because of Arminius’ defense of human free will, he was accused of being a Pelagian (Stanglin 2007: 126). Arminianism was later refused by the Reformed Synod of Dordrecht (1617–1618), in which Calvinism asserted its five

points: (1) Total depravity of human nature: humans are completely corrupted by original sin; (2) Unconditional election: God elected some men without considering their merit; (3) Limited atonement: Christ died only for the elected; (4) Irresistibility of God’s grace: the elect cannot refuse God’s vocation; (5) Perseverance of the saints: the elect cannot lose grace or salvation.

The Catholic Answer

The Catholic Church maintains that “No one, moreover, so long as he is in this mortal life, ought so far to presume as regards the secret mystery of divine predestination, as to determine for certain that he is assuredly in the number of the predestinate” (Waterworth 1848: 39–40). This principle is stated in chapter 12 of the Decree on Justification, issued on the 13th of January 1547 by the Council of Trent. Moreover, the Tridentine fathers condemned the idea of double predestination in the 17th anathema of the same decree. The Council of Trent also declared the importance of human free will and its actions in the economy of salvation, although the cooperation of God’s grace is needed, since God’s grace is always first. In this way, the Church rebuts both Reform-minded theologians and Pelagius (360–420), who considered men able to reach salvation without the concurrence of grace. Catholicism, therefore, focused its interest more upon the relation between God’s foreknowledge and human free will rather than predestination. In particular, three schools arose: (1) the anti-Pelagian, Augustinian scholars in the Spanish Netherlands, (2) the Thomist-Bañezian theologians in Spain, both of whom stressed the efficacy of God’s grace, and (3) Molinists (see “► [Molinism in Renaissance Philosophy](#)”), who stressed the importance of human free will. The debate between the first two theological schools and the third one was fierce: the Thomist and Augustinian-minded scholars called their Jesuit opponents “Pelagians,” while the Jesuits in turn called them “Calvinists” (Craig 1988: 170). In 1597, Pope Clement VIII was forced to constitute the *Congregatio de Auxiliis* (“Congregation on [Grace’s] aids”), in order to resolve the debate

between the two parties, Domingo Bañez (Mondragón, 1527 – Medina del Campo, 1604) and the Jesuit Luis de Molina (Cuenca, 1535–Madrid 1600). A similar debate also took place in the Spanish Netherlands, between Michael de Bay (Meslin-l'Évêque, 1513 – Leuven 1589) and the Flemish Jesuit Leonard Lessius (Brecht, 1554 – Leuven, 1623). Again the former stressed God's grace, while the latter stressed human free will (Van Eijl: 1994). Finally, in 1607, Paul V intervened in the discussion, accepting both views as legitimate and forbidding the opponents to define each other as heretics. Within this discussion, predestination was always conceived as Augustine had conceived it, namely as "preparation for grace." The problem was therefore addressed to the concept of grace.

Which Grace? Adjuvant, Efficacious, Cooperative, Sufficient?

Catholic theologians diverged not only on questions regarding the nature of grace itself but also on questions regarding who the proper recipient of grace is. The radical anti-Pelagian, Augustinian-minded theologians and the Thomist-minded Bañezian theologians both maintain that God did not bestow the possibility of salvation on everyone, thus denying some sufficient grace that, on the contrary, would assure the possibility of conversion to everyone. Opposing this view, the Jesuits affirm that God created human beings not for their perdition, but for their salvation, giving them all the instrument – sufficient grace – to obtain eternal life. Moreover, Augustinian-minded theologians consider God's grace efficacious of itself. Men do not have to earn eternal life through their merits, since grace itself guarantees them their salvation, although they retain in principle the will to refuse God. Against this view, the Jesuits maintain that God bestows his sufficient grace on everyone, but each person must act well in order to be worthy of salvation. Therefore during a person's life, God sends his aids, such as preaching and sacraments, and so the adjuvant grace which induces men to believe. Once they convert themselves, their will

is helped by God in cooperation in which both human free will and God's grace work together for salvation.

Printing Technique, Renaissance

Shanti Graheli
University of Glasgow, Glasgow, UK

Abstract

The advent of print is widely acknowledged as one of the defining factors of the Renaissance. The printing process developed upon pre-existing techniques, such as the handpress already in use for block printing. Its fortune was largely supported by the dissemination of paper throughout Europe in lieu of parchment and other animal supports. Indeed, print usually developed in the proximity of papermaking centers. Moveable types were made of an alloy formed by lead, tin, and antimony that made them suitable for the mechanical process of printing. A printing shop included various roles within its walls: the pressmen, the compositor, and the master printer (though these may vary depending on the size of the workshop). The production of a book as a finished commodity relied on a number of different trades, depending on the presence and typology of illustrations, or the customization required by the reader.

Heritage and Rupture with the Tradition

The advent of the handpress book in early modern Europe around 1450 was a media moment of exceptional importance. The production of books was thus made much faster than it ever had been. Medieval Europe had been full of books; the production of manuscripts was a very efficacious commercial enterprise before the printing press and continued to be so well after (Pettegree 2010). Since the twelfth century, the trade of manuscripts had included procedures for the serial reproduction of text. The *pecia* system allowed to quickly replicate a text – traditionally, student handbooks – by splitting a manuscript into quires and assigning each to a scribe. Rather than an exercise in contemplation, the production of manuscripts evolved into the book trade alongside the growth of the major European universities and soon turned to devise the most suitable strategies to increase sales. As Elizabeth Eisenstein put it, “book production . . . had thus moved out of scriptoria three centuries *before* the advent of print” (Eisenstein 1979). The printing industry revolutionized the manufacturing of books by increasing the speed of serial reproduction of text dramatically. Originally this was the main objective of the book merchants who invested in a printing press: printed books were essentially the surrogate of manuscripts, designed to replicate the traditional features of their predecessors. The following decades in the history of printing were marked by the gradual detachment from the manuscript world.

Printing built on two pre-established techniques: the handpress, already used for block printing in the fourteenth and fifteenth century and itself based upon the much older wine press, and rag paper, imported into Europe via the Arab world in the twelfth century and perfected thanks to the spreading of linen textiles (Febvre and Martin 1976; Harris 2017). While representing the single most expensive element in the production of books – amounting to some 40% of the entire production cost – paper was significantly cheaper than the traditional skin and lent itself much better to the printing process if treated properly. The paper industry required a regular supply

of rags or rope, as well as clear-running water, both to operate the paper mill and for the rag paste that would become paper (Febvre and Martin 1976). The ideal location for papermaking, therefore, was near cities, where used rags would be easier to purchase, and uphill, so that water may run clean and fast. The flourishing of Fabriano, Italy, in this industry is thus easily explained, given its location in the mountainous Marche region, not far from densely populated areas. The consolidation of the great printing centers naturally took place in areas that had quick access to paper; the area around Lake Garda in Italy served the rapid expansion of the Venetian printing press, while paper mills in the Troyes area were the key paper suppliers in Paris. Indeed, the prominence of Troyes paper in Paris pre-dated the printing press and was well established before printing ever commenced (Febvre and Martin 1976).

Printing in itself already existed in late-medieval Europe in the form of block printing. Hundreds of thousand impressions – mostly of saints and other devotional subjects – had already been circulating in the late fourteenth and the early fifteenth century. The earliest dated example is a woodcut of St Christopher (1423), held in the John Rylands University Library, Manchester. Block printing was even used for short books, such as the *Biblia pauperum* or the *Ars moriendi* (Febvre and Martin 1976). Images were well suited to be carved in wood; however, the same material was not appropriate for the carving of small letters, which required a higher degree of precision. As a rule, only limited text was included with these iconographic blocks and was usually quite rudimentary. Text carved into a wood block of course would also create a certain fixity in the use of the block itself – therefore, while it might be suited for standard images intended for wide dissemination, it was not very useful in the case of books. Individual letters that could be composed into any text were much better value for money, as they could be used *ad libitum*, until they were worn.

Print was not the invention of one individual, but it was in many ways a natural development for the book world; around mid-fifteenth century,

others were at work trying to come up with the method that Johann Gutenberg is largely credited with today. In the words of Daniel Berkeley Updike, “Gutenberg’s invention consisted . . . in making brass moulds and matrices by which type could be *accurately cast in large quantities*” (Updike 1922). Many of the proto-typographers were goldsmiths by training; the skill in metalwork was essential in identifying the most suitable alloy for metallic characters, neither too hard (as it would break) nor too soft (as it would bend). Metal types were made of lead, tin, and antimony, though the compound varied in its proportions well into the eighteenth century (Febvre and Martin 1976). The alloy composition made it easy to work with, giving it a low melting point and a stable volume once the metal had cooled down (Gaskell 1995).

Like other features of the early printed book, types were designed to mimic script. Different declinations of the gothic script inspired many early types, especially in the Germanic territories. The revival of classical learning in Italy led to the development of humanist scripts – thought to be based on classical models, but in truth mimicking the Carolingian minuscule from medieval manuscripts. Roman types, common in Italy and soon imitated throughout Europe, were a mixture of the humanist script for lowercase letters and Roman epigraphic letters for the uppercase. The expressions themselves “lowercase” and “uppercase” derive from the distribution of the individual characters in the typographical case, from which the compositor would select them to set a text in metal type.

Non-Latin scripts took longer to develop due to technical difficulties. Among these scripts, Greek was the most important to the printing presses in Renaissance Europe. Greek printing in the fifteenth century was largely experimental (Gaskell 1995). The Aldine Press, founded by Aldus Manutius the Elder in the late fifteenth century, was the first to employ a cursive Greek script that was soon imitated throughout Europe (Barker 1992; Gaskell 1995). The Aldine Greek remained a widely sought-after model and was hugely influential in the printing and reading of Greek texts for some 300 years (Gaskell 1995). Wise to

the importance of his investment, when he was finally satisfied with the result of the commissioned Greek type, Aldus requested a privilege from the Venetian government to prevent others from imitation (Barker 1992).

Soon after, the Aldine Press released yet another font of type, inspired by the Latin cursive script (McLeod 2015). The Aldine italic was immediately a great success, and it was imitated throughout Europe, despite Aldus's efforts in securing another privilege. The new italic type was more compact than Roman types, despite allowing for a lighter-looking page; therefore, it was particularly well suited to small-format books, and indeed it came to fame through its use in the famous Aldine enchiridia or pocket-size books.

In the early years of printing, the printing shop usually also owned the matrices to produce their types; therefore much of the identification of early books can be done by looking at the type. The online portal, *TW – Typenrepertorium der Wiegendrucke*, developed alongside the *GW – Gesamtkatalog der Wiegendrucke*, offers many such examples. From the mid-sixteenth century onward, it became customary that printers and publishers could acquire the type but did not own the matrices. These remained the property of the type designer, who could then sell the type to multiple customers (the examples of Claude Garamond or Robert Granjon are prominent). By this stage, printing types can no longer be used as means for the identification of editions.

Innovative and Original Aspects

The best analytical description of the typographical materials, the printing process, and the individual roles in a printing shop are given by Philip Gaskell (1995). Much of the process remained unchanged for some three centuries, so the illustrations of Diderot and D'Alembert's *Encyclopédie* remain for the most part on point for the Renaissance printing technique. English-speaking readers may use the version with an introduction by Giles Barber (1973), as well as

consulting the original *Encyclopédie*, available in open access on Gallica.fr.

The common press was formed of a wooden frame, fixed to the floor and the ceiling so to avoid movement. To this frame, two core moveable parts were attached: the carriage assembly that held the paper and the type and could slide in and out, and the impression assembly that performed the actual printing, pushed down onto the sheet and type by use of a lever (the bar). The carriage assembly was formed of a series of frames that folded onto one another: the sheet of paper was placed upon the tympan and fixed with pins; the frisket was then folded onto the sheet of paper, covering any parts of the sheet that should not be inked, similarly to a stencil; the tympan was then folded over onto the press-stone, and the coffin was rolled under the press. The rear of the tympan was padded with parchment and other recycled materials so that the impression would not tear the paper. The impression assembly was actioned by pulling the bar that would in turn move a wooden or metal nut which would cause the hardwood (or metal) platen to hit the tympan and the sheet of paper through it. The wooden press was operated by two pressmen: one pulled the bar and changed the sheet and the other inked the type. Pulling of the bar was a significantly heavier job, therefore the pressmen took shifts.

Handpress books were produced one sheet at a time, or indeed, one side of a sheet. The volume of work undertaken by the pressmen would vary considerably, though the highest figure for a day's work would have been in the region of 3,000 impressions (not sheets). Detailed account books such as those by Christophe Plantin offer real-life examples based on well-documented work undertaken at the Officina Plantiniana (Gaskell 1995). In setting up the printing, a number of preliminary operations had to be performed. The compositor or the master printer had to calculate the number of words in the text, so to estimate the overall length of the edition and to allocate work – a process known as “casting off” (Gaskell 1995). Thanks to such calculation, the composition of the text could be done by formes, i.e., the inner side of an entire sheet first, followed by the outer forme. While these calculations were usually fairly

accurate, the signs of a slightly erroneous casting off can be detected in the increased presence of abbreviations (when there was more text than anticipated) or added spaces between words or letters (when there was less text than anticipated), especially in the first page of a gathering.

The compositor worked with the type cases, choosing the characters one by one and composing the text (usually two lines at the time, but Gaskell [1995] suggests a different number of lines depending on the region) using a composing stick. The lines of text were then transferred onto larger trays known as “galleys.” Once the text set in metal reached the length of one page, it was completed with running title, page or leaf number, catchword, and signature; these elements were not always present, though they became increasingly more common throughout the sixteenth century and beyond (Sayce 1966). The type-set page was then tied with string, to ensure that all the lines were kept together (dropping type was one of the most common accidents in the printing workshop; Bowers 1949). Once the pages for a whole side of the sheet were set in type – the number of individual pages depended on the format – the process of imposition took place. The pages were distributed in the correct order, that is, the order in which they should be once the printed sheet was folded; they were then locked within a frame (the “chase”), using wedges and pieces of wood to fill in all the empty spaces, so that the type could not move. The chase was then transferred to the press, and the forme was ready for printing. A proof was usually printed, so that any mistakes could be removed from the text, though stop-press corrections were also extremely common, meaning that during the printing of a full run, the printing was halted, a correction was made, and the printing recommenced with the altered text. The two versions thus printed are what are called “state” variants (Bowers 1949). In most cases, the sheets printed before the identification of a mistake were still commercialized, as the cost of the paper made it uneconomical to discard them as waste. Often errors were only noticed much later in the process; printing shops such as the early Aldine Press would often make interventions in manuscript to correct the

erroneous instances. More commonly, an “*errata corrige*” (“mistakes to be corrected”) was printed at the end of the text, so that readers could make the corrections themselves if they so wished. Most of the time, however, mistakes went unnoticed and uncorrected. The type was usually distributed back into the cases immediately or soon after printing (Gaskell 1995).

The pile of sheets to be printed was wetted the day before and left under weight overnight. This was essential, as dry paper would have torn under the press, despite the padding provided by the tympan. Damp paper was also better suited to receive the ink, and this preliminary operation ensured a much better and even inking. Printing ink was made of varnish and color, resulting in a fatty liquid; consistency was important so that the inking balls run smoothly over the type, and the ink should dry quickly (but not too quickly, or it would not transfer onto the paper) but without staining (Febvre and Martin 1976; Gaskell 1995).

Inking in more than one color was achieved by printing each sheet in the first and then in the second (and subsequent) color. The frisket was cut accordingly, so to cover the sections of the sheet that ought not to be printed. The most common combination was red and black, the traditional coloring of books of liturgy. Elizabeth Upper Savage has been investigating the evidence provided by remnants of red frisket sheets in detail, with an ongoing census as part of her study (Upper 2014). The early printers attempted to print in two colors in one go, which resulted in contamination between the inks (Gaskell 1995). The process was, in any case, time-consuming, which accounts for the higher cost of such books. Occasionally other colors were used under the press in early printed books (e.g., yellow) though these experiments are in the minority. A recent collection of essays (Stijnman and Savage 2015) explores the use of color in pre-1700 printmaking, offering the first systematic treatment of the topic in a pan-European context.

While woodcut illustrations were printed through the same process as moveable type and could therefore be embedded in the same composition, copperplate engravings were produced on a

different press altogether. Copper allowed for a much finer detail but required constant retouching due to the softness of the metal; such illustrations usually exist in a set of states, following the necessary touching up. Engravings were printed with a special rolling press, and indeed, often the illustrations to accompany a text were printed in a separate workshop from the rest of the book. Engraved illustrations were significantly more expensive than woodcut ones, and they might amount to more than all the other production costs put together (Gaskell 1995).

Few early modern accounts of the printing process are preserved, as such handbooks tended to be for the internal use of a workshop and were thus used for destruction. Neil Harris has made a comprehensive list of known contemporary sources (Harris 2004). Most printing shops relied on different trades, such as paper as discussed above, punch cutters for the provision of type, and engravers and chalcographic presses for copper-engraved illustrations. Books were very rarely bound in the same place where they were printed, as binderies were separate businesses altogether (and indeed, the decoration of the bookbinding may be performed by a gilder). Customization processes added after printing continued to exist alongside the circulation of standard copies, usually by commission of the customer/reader – such as the bookbinding or the hand-coloring or illumination of the book. The production of the book as a finished commodity, therefore, relied on several different crafts.

Impact and Legacy

The impact and legacy of print can hardly be emphasized enough. It has been defined as a revolution (Eisenstein 2012), transformative of the cognitive and epistemological processes (McLuhan 1962). While scholars continue to discuss the extent of this impact on society, it certainly influenced and catalyzed the growth of literacy and the standardization of European vernacular languages through the circulation of compositorial practices.

Proclus in the Renaissance

Guy Claessens
Institute of Philosophy (HIW), KU Leuven,
Leuven, Belgium

Abstract

From the beginning of the fifteenth century onwards, Greek manuscripts of the works of the fifth-century Neoplatonist Proclus start to circulate among humanists such as Cusanus, Bessarion, Ficino, and Pico, although some of the medieval Latin translations by William of Moerbeke continue to play an important role as well. Proclus' metaphysical interpretation of Plato's *Parmenides*, and especially its theory of the One, i.e., the first principle of reality, had a major impact on the thought of Cusanus, Ficino, and Patrizi. Cusanus follows Proclus' sharp distinction between the first One – which transcends being – and the second One – which *is* – and he uses Proclus' qualification of the One as “not other” (*non aliud*) as a name to express both God's transcendence and immanence. Ficino makes extensive use of Proclus' commentaries in his own exegesis of Plato's *Parmenides* and *Timaeus*. Like Cusanus, he appears to adopt Proclus' distinction between the first two principles, although he mainly

uses Proclus as a doxographical source. Patrizi provides us with one of the most comprehensive receptions of Proclean metaphysics in the Renaissance. His discussion of the first principle, where he distinguishes between the absolute One and the essential One, is clearly based on the Neoplatonic interpretation of the first hypothesis of the *Parmenides*. In the sixteenth century, the rediscovery of Proclus' commentary on Euclid's *Elements* sparked off an intense debate on the certainty of mathematics, whereas its central claim, namely, that mathematical concepts are innate, was adopted by Kepler at the beginning of the seventeenth century.

Heritage and Rupture with Tradition

In the Latin Middle Ages, Proclus' influence had been both direct and indirect. For a long period, it was mediated through the works of Pseudo-Dionysius the Areopagite and the *Liber de causis*, until, in the second half of the thirteenth century, the Flemish Dominican William of Moerbeke translated the *Elements of Theology*, the *Tria opuscula*, the commentary on the *Parmenides*, and a part of the commentary on the *Timaeus* into Latin. During the High Middle Ages, the *Elementatio theologica* was by far the most important of Moerbeke's translations: it was cited, among others, by Thomas Aquinas, Henry of Ghent, and Albert the Great and allowed Aquinas to identify the *Liber de causis* as an excerpt from Proclus' *Elements of Theology*.

From the fifteenth century onward, Greek manuscripts of Proclus' works circulated widely, and copies were owned by Nicolaus Cusanus, Basilius Bessarion, Marsilio Ficino, Francesco Patrizi, Giovanni Pico della Mirandola, and others. Moerbeke's translation of the *Elements of Theology*, a summary of Proclus' metaphysics in the form of 211 propositions and proofs, was owned, among others, by Coluccio Salutati, Cusanus, and Lucas Holstenius, whereas Greek manuscripts of the text belonged to Bessarion, Pico, Patrizi, and again Holstenius (Kristeller 1987: 198). Ficino made excerpts from the

Greek text and a translation which is now lost. Nonetheless, the *Elements of Theology* appear to have been studied less intensively during the Renaissance than had been the case during the later Middle Ages, with the notable exception of Patrizi, who published a new translation in 1583 (Gersh 2014a: 21).

Cusanus owned – and richly annotated – a copy of Moerbeke's translation of the commentary on the *Parmenides*, and Ficino relied heavily on the Dominican's translation in his own commentary on the *Parmenides*. In the sixteenth century, Proclus' *In Parmenidem* was again translated by Nicolaus Scutellius.

It was only in the fifteenth century that one of Proclus' longest and most important works, the *Platonic Theology*, entered the Latin West. A first Latin translation, commissioned by Cusanus, was started but never completed by Ambrogio Traversari, while Pietro Balbi – again at the request of Cusanus – accomplished the task in the early 1460s (Kristeller 1987: 201). The title of Ficino's magnum opus, the *Platonic Theology*, was inspired by the Neoplatonist, although significant differences between both works exist. Most of the arguments that Pico attributes to Proclus in his *Conclusiones* are taken from the *Platonic Theology*, and the text was used extensively by Patrizi and Agostino Steuco (Kristeller 1987: 202). The work was translated by Scutellius in 1520.

Greek manuscripts of Proclus' commentary on the *Timaeus* were owned by Bessarion and Ficino, and Paolo Beni made a partial translation of the work in 1593. The work was also used by Pico as a doxographical source for his *Conclusiones* (Gersh 2014a: 27). Ficino translated excerpts from Proclus' commentaries on the *First Alcibiades* and the *Republic*, and both works were rendered into Latin by Scutellius. Both Bessarion and Pico had a Greek manuscript of Proclus' *Commentary on the First Book of Euclid's Elements*, and several passages from the prologue were incorporated in Giorgio Valla's encyclopedia *De fugiendis et expetendis rebus* of 1501 and translated in Kepler's *Harmonices mundi* of 1619. Proclus' commentary on the *Cratylus* was excerpted by Patrizi, and Ficino

claims to have made a translation of the *Hymns*, though this work has not been preserved (Kristeller 1987: 202). In 1488 Ficino translated the short treatise *De sacrificio et magia*, which plays a prominent role in book III of Ficino's *De vita*. Finally, translations of the *Elements of Physics*, a treatise on motion, were made by Ficino and Patrizi, but the former's translation is lost. Most of the *editiones principes* of Proclus' works were published by the German humanist Simon Grynaeus in the 1530s, but the *Platonic Theology* and *Elements of Theology* were only printed for the first time in 1618, in the edition by Aemilius Portus.

Impact and Legacy

As far as the influence of Proclus' philosophical doctrine is concerned, three Renaissance philosophers stand out: Cusanus, Ficino, and Patrizi.

Cusanus' first explicit citation of Proclus is found in *De beryllo* (1458), where he uses Proclus as an indirect source for a passage from Plato's *Epistula II*, but the Neoplatonist figures most prominently in the works *Tu quis es/De principio* (1459), *De non aliud* (1462), and *De venatione sapientiae* (1463). It is important to note that Cusanus believed that Proclus had lived after the time of Dionysius, which significantly shaped his interpretation of Proclean ideas in the framework of Christian theology. In his treatise *Tu quis es*, Cusanus drew heavily from Proclus' *In Parmenidem*, especially in following the distinction between the first One which transcends being, and the second One which *is* (*Tu quis es*, §19–28). By means of the Christian identification of God and “being itself,” both principles are directly connected in Cusanus' theology (Beierwaltes 1987: 291–292), where God is both being and beyond being. Proclus also played a major role in the development of Cusanus' concept of the not other, introduced in the dialogue *De non aliud* (Santinello 1993: 112–114). In keeping with Cusanus' theory of the coincidence of opposites, the Proclean expression οὐδὲν ἄλλο – attributed to the One (e.g., *Theol. Plat.* II, 3) – is used by

Cusanus as an enigmatic name to express both God's transcendence and immanence. God is *non aliud*: He cannot be identified with something other than Himself, nor is He "other" with regard to anything else. But since everything in creation is defined as *non aliud* with respect to itself, God is also in anything other than Himself (*De non aliud*, §20). In *De venatione sapientiae*, Cusanus refers to Proclus' theological system as expressed in the *Platonic Theology*. He mentions Proclus' distinction between creator-gods, the creator-intellect, celestial, mundane, and various external gods (*De ven. sap.* §21) and also refers to Proclus for the belief that all things derive from the finite and the infinite (*De ven. sap.* §88) (Gersh 2014b: 341–342). Cusanus' reception of Proclus can generally be characterized as a transformation and integration of a Neoplatonic metaphysics of the One into a Christian theology of divine transcendence and immanence.

Like Cusanus, Ficino was unaware of the exact relation between the writings of Proclus and the *Corpus Dionysiacum*, and he considered Proclus a non-Christian imitator of Dionysius (Allen 2014: 354). Nonetheless, the Neoplatonist served as one of Ficino's most important doxographical sources and, to a large extent, determined the Florentine's perspective on the Platonic tradition. Ficino followed Proclus in believing that the *Timaeus* (on physics) and the *Parmenides* (on theology) encompassed the whole of Plato's philosophy, and he made extensive use of Proclus' commentaries in his own exegesis of both dialogues (Allen 1982; Megna 2003). Ficino is probably indebted to Proclus for the development of his fivefold hierarchy of being – God, angelic mind, rational soul, quality, and body (Allen 1982) – and clearly follows Proclus' *In Parmenidem*, which he mainly used in the translation of Moerbeke, in his interpretation of the nine hypotheses of the *Parmenides* (Allen 2014: 366). For example, according to Ficino, who adopts Proclus' metaphysical interpretation of the dialogue, the first three hypotheses concern the first causes, and the following two introduce species and matter, whereas the last four hypotheses demonstrate that if the One does not exist, then nothing exists (*In Parm.* ch. 51; cf. Proclus, *In Parm.* 1059).

In the same work, Ficino also adopts Proclus' sharp distinction between the first principle, namely, the One and the Good, and the second principle, being and intellect, although the separation between both principles is not that rigid in his *Platonic Theology* (Kristeller 1987: 206). The general framework of Ficino's *Compendium in Timaeum* (1496) is also inspired by Proclus' corresponding commentary: in the introduction, Ficino takes up Proclus' definition of nature as the instrument of divinity. In his discussion of Plato's view on the eternity of the world (*In Tim.* ch. 13), Ficino uses Proclus as his source to distinguish between the interpretation of Severus, Plutarch, and Atticus, who claimed that the world had a beginning in time, and the view of Crantor, Plotinus, Porphyry, Iamblichus, and Proclus himself, who asserted that the world existed from eternity. In general, although Ficino's use of Proclus was often inspired by doxographical purposes, the Neoplatonist's metaphysical interpretation of Plato's *Parmenides* considerably influenced Ficino's Christianized Platonism.

In Patrizi's *Nova de universis philosophia* (1591), we find the most elaborate reception of Proclean metaphysics in the sixteenth century. Together with Syrianus and Damascius, Proclus provided Patrizi with the Neoplatonic core for his "new philosophy." Like Cusanus and Ficino, Patrizi was greatly interested in Proclus' doctrine of principles and theory of the One (Leinkauf 2014: 383). His discussion of the first principle in the *Panarchia*, the second part of the *Nova de universis philosophia*, clearly echoes the writings of Proclus and Damascius and especially the Neoplatonic interpretation of the first hypothesis of the *Parmenides*. According to Patrizi, a distinction can be made between the absolute, pure One (*unum tantum*), which is beyond being and essence, and the essential One (*unum essenziale*) or primary unity (*unitas primaria*), which emanates from the absolute One and comprises all unities (lib. I–V). In the first One, everything is "one" in a uniform (*uniter*) – a rendering of the Greek *ἐνναιώς* – and undivided manner, whereas in the One Being, everything is "united" (*unita*) in a differentiated manner. Patrizi here follows the

(Neo)Platonic model of enfolding and unfolding to describe the gradual multiplicity arising from the absolute One (Leinkauf 2014: 394–395). Still according to Patrizi, the first One, which is not other (*non aliud*) than the One, can be identified with God the Father, the second One can be equated with God the Son or the Word of God, and the Son’s love for the Father forms the third hypostasis of the Trinity (lib. X, 21r). In the same context, he uses the term “paternal depth” (*paternum profundum*) from the *Chaldean Oracles* (cf. Proclus, *In Tim.* I, 312, 7) to denote the domain of the primary unity and its love for the absolute One. Below the first One, Patrizi’s chain of being consists of essence, life, mind, soul, nature, quality, form, and body. The triad essence, life, and mind appears to be a further differentiation of the primary unity (lib. XI, 23v), although Patrizi – like Cusanus, Ficino, and Proclus himself – appears to favor the derivative triad of *essentia*, *virtus*, and *operatio* (Leinkauf 2014: 397). It is safe to say that in Patrizi’s new philosophy, the reception of Proclean metaphysics reached a level that would not be matched for centuries to come.

The rediscovery of Proclus’ philosophy of mathematics, as expounded in the prologue of his *Commentary on the First Book of Euclid’s Elements*, was the initial impetus to the sixteenth-century methodological debate known as the *quaestio de certitudine mathematicarum* (De Pace 1993). In his *Commentarium de certitudine mathematicarum* (1547), Alessandro Piccolomini invoked the authority of Proclus to buttress his claim that mathematics does not make use of so-called *demonstrationes potissimae*, i.e., demonstrations that give knowledge of both the fact and the true and immediate cause of that fact, and is therefore inferior to natural philosophy. According to Piccolomini, the certainty of mathematics lies in the abstract nature of its objects, and he refers to Proclus with regard to the intermediary nature of mathematical objects and their existence in imagination (*phantasia*) (*De cert. math.*, 97r). Piccolomini’s fierce attack was countered by Francesco Barozzi, who published the first Latin translation of Proclus’ *In Euclidem* in 1560. Like Proclus, Barozzi uses the intermediary nature of

mathematics as an argument for its supremacy over natural philosophy: since mathematical objects are devoid of sensible matter, they direct us toward the intelligible realm. In 1615, in his *De mathematicarum natura dissertatio*, Giuseppe Biancani argues that Piccolomini’s reading of Proclus is incorrect (*De math. nat.*, 19–20) and that the Neoplatonist did believe that mathematicians use demonstrations *per causas* (Helbing 2000: 182). In addition, Proclus’ reference to a ὅλη μαθηματική in the same commentary (*In Eucl.* 18, 10) gave rise to speculations about a universal science of mathematics or *mathesis universalis* (Rabouin 2010: 224). Finally, according to Johannes Kepler in his *Harmonices mundi* (1619), Proclus was the only one in Antiquity to have given a philosophical interpretation of Euclid’s *Elements* (*Harm. mundi*, 15). In his theory of the harmonies, Kepler frequently appeals to Proclus’ philosophy of mathematics (Claessens 2011), and he translated a lengthy passage from Proclus’ commentary (*In Eucl.* 12, 2–18, 4), in which the Neoplatonist refutes Aristotle’s abstractionist account of mathematics by setting forth his own theory about the intermediate being of mathematical concepts. Kepler follows Proclus in claiming that the circle and the arc – the constitutive terms of the archetypal harmonies – belong essentially to our soul (*Harm. mundi*, 277). The reception of Proclus’ philosophy by one of the most famous early modern astronomers shows that the Neoplatonist’s influence reached well into the seventeenth century and beyond.

Profession, Renaissance Idea of

Douglas Biow

Department of French and Italian, The University of Texas at Austin, Austin, TX, USA

Abstract

Having a profession, and thus having professional identity, increasingly mattered in late Renaissance Italy, above all in the sixteenth century. At the same time, there was a growing sense of the value of something that we might in retrospect reasonably call “professionalism,” even if that particular term was certainly not part of the available discourse of the period.

Heritage and Rupture with the Tradition

Having a profession (*fare una professione*) meant in Renaissance Italy that you could literally profess (*profiteri* is the Latin infinitive), you felt entitled to speak out on various matters to which you could claim mastery in your daily working life – as a doctor, a theologian, or a lawyer – to take three long-standing, recognized “professioni” of, before, and after the period in question. Accordingly, the term “profession” could be used as a virtual synonym for “art” (Italian *arte*, Latin *ars*), with the term “art” understood – like the concept of *techne* from the time of the ancient Greeks – as a highly specialized, determinate, rational, communicable, reliable, teachable, and often rule-bound form of skillfully applied and socially valued knowledge. More precisely, in the strictest sense of the term, a “professione” signified *the area of expertise* practiced by someone with significant training in it, while an “arte,” at least as the concept unfolded historically, typically signified *the form of knowledge* that the practitioner put into practice in the course of expertly working in the profession. So the two terms – *arte* and *professione* – could indeed be set side by side in

the same phrase without being seen as entirely redundant in meaning. Put differently, in theory, we can think of an art as a form of knowledge put into practice (the know-how of rhetoric, say, which allows one to be a rhetorician) that underpins a profession as an area of expertise (actually being a rhetorician who applies that knowledge of rhetoric with admirable skill). But a profession (being a rhetorician) does not underpin an art (rhetoric). Nevertheless, in reality, the two terms were used often enough interchangeably in Italian Renaissance culture, where “artes” can also refer to guilds, such as the 21 major and minor “arti/artes” of Florence and where one of the definitions synthetically applied to the term “professione” in the *Vocabolario degli Accademici della Crusca* (*Lexicon of the Academicians of the Crusca*, 1612) is, in fact, “ars.”

Innovative and Original Aspects

In thinking about Renaissance Italy, it would certainly be a mistake to talk about “professionalism” in the precise modern, sociological sense of the term: in order to signal the organizing, controlling, and credentialing of exclusionary labor in the full-blown capitalist economies associated with the large, complex, bureaucratic nation-states of the west in the nineteenth, twentieth, and twenty-first centuries. That said, it would be correct historically to use the term “professionalism” in a broader sense: in order to signal how widespread interest in professions and professional identity did indeed intensify greatly in the brokerage, patronage, guild-controlled, gift-giving, and proto-capitalist market economies of the small but increasingly bureaucratic courts, republics, princedoms, and duchies of late Renaissance Italy. In the sixteenth century, both practitioners and non-practitioners alike, after all, wrote an unprecedented number of treatises – far more than any prior century – directly addressing what was required in order to succeed in everything from being an ambassador, courtier, prince, cardinal, soldier, and secretary to that of a sculptor, architect, painter, metallurgist, engineer, cook,

goldsmith, surgeon, medic, and steward. In the process of doing so, these practitioners and non-practitioners self-consciously spoke about what it meant to have specifically a “professione,” and they articulated at the same time rivalries among “professioni.” As a result, the sixteenth century in Italy experienced what has been called a profound shift in a “rhetoric of profession,” with rhetoric here understood not just as the formal art of persuasion but as a discourse that is bounded with traceable *topoi* (commonplaces) and that is historically and culturally determined.

Impact and Legacy

This shift in the rhetoric of professions involved, among other things, marked attention to professional self-definition; a truly broad-based cultural exploration, leveling, and secularization of professions; increased attention to the value of vocational choice and work as a source of happiness and self-worth; a popularizing of these issues through the commercial press and in the vulgar tongue; an astonishing proliferation of the topic of professions in a variety of less learned cultural forms, from encyclopedic compendia to chronicles, to jokes, to civic rituals, to carnival songs, and to parlor games; and an extraordinary increase in – as well as cultural acceptance of and resistance toward – different professions as indeed professions. This widespread investment in professions culminated toward the end of the sixteenth century in Tomaso Garzoni’s cornucopian *La piazza universale di tutte le professioni del mondo* (*The Universal Piazza of All the Professions in the World*, 1585/1587), a massive, quirky, and encyclopedic book that covered virtually every profession under the sun, from that of the Petrarchan-modeled, humanist scholar ensconced in his study to, at the opposite end of the social spectrum, that of the lowly street cleaner or, for that matter, even the conniving street charlatan. We can thus legitimately talk about Italy possessing by the end of the sixteenth century something akin to what sociologists have called a “system of professions” long before

professionalism, as we have come to understand it in the academy today, took hold in the modern, post-Enlightenment era.

Providence, Renaissance Idea of

Anne Régent-Susini

Université Sorbonne nouvelle, Paris, France

Abstract

In the Renaissance, under the influence of the Reformation but also of “Neoplatonists” or natural philosophers observing material phenomena, the idea of *fortune* seems challenged, and *providence* makes a comeback, albeit in a problematic way. The ancient debate between Stoics and Epicureans seems to be played again, but it is fundamentally transformed by a new idea of human freedom and by the Christian views on God’s personal care for the world. Emphasizing fortune, or a more modern contingency, and the resulting denial of providence, become a way of radically questioning the very existence of God.

But even for those who believe in providence, this very concept is more and more challenged, especially in two main directions. First, for skeptics who revive the Epicurean tradition, providence, if it exists, has little or no relation to the particular affairs of individuals. Second, for Reformers or Christians influenced by authors such as Montaigne, providence operates in ways that are beyond the reach of human reason or experience. These new representations of the relation between man and the heavenly powers tend to

weaken the medieval sense of relative security, while a strong urge to find coherence in a troubled world still remains, exemplified in particular by the writing of universal histories or cosmographies.

Heritage and Rupture with the Tradition

The word *providence* derives from Latin *providere*, which means “to see in advance, foresee” as well as “to provide.” It refers to the way a transcendent agent governs the world in a just and rational way. In a broader sense, providence deals with the whole Creation; in a narrower sense, it only deals with mankind, and especially history. When capitalized, the concept can be identified with God, especially in the Christian context of a personal God. However, the history of this concept starts well before Christianity and even well before the actual word “providence” appears. Indeed, in Greek and later in Latin, the same word, be it *cosmos* or *mundus*, means both the *world* and a form of aesthetic achievement or perfection (*cosmos* = order and consequently beauty and *mundus* = totality and purity). This dual etymology has invited generations of thinkers to recognize in the visible world an expression of divine goodness.

The idea of a transcendent design is rooted in Greek Antiquity. It can be traced back to Anaxagoras, whose views are discussed by Socrates in Plato’s *Phaedo* (98b-c, see also *Laws* Lois 896e–907b-c). However, it is with Plato himself that the idea of providence really emerges, though it still lacks any precise designation. In *Timaeus*, Plato presents divine providence as a principle of conservation of a preexisting cosmic order, combining mutability and immutability. Platonic providence, therefore, identifies with the natural order, which implies a repetitive and cyclic time.

Nevertheless, only with the Stoics does the proper concept of *pronoia* explicitly appear, especially with Chrysippus (c. 279–c. 206 BC), who advocates firm anthropocentrism, according to which all nature is eventually made for man. Seneca dedicates a whole treatise to providence. Probably influenced by the Stoic Posidonius, Cicero

claims that the world is “made and ruled by divine providence” (*De Natura Deorum* 3, 92). The Stoics generally view providence as a metaphysical principle of universal explanation, which implies a total and inescapable determinism – and they claim that if providence is nothing but the world order, the wise man has to agree to this order (also called *fate heimarménè* or *fatum*) and even to desire it.

Conversely, Epicureans think that gods are fundamentally indifferent to man and subsequently that there is no providence but only chance; the wise man has to become indifferent to what he cannot change or understand, in order to avoid all suffering and worrying.

As for him, the Greek biographer and essayist Plutarch (c. 46–120) adopts a Platonist position, halfway between the Stoics and the Epicureans: he claims that a supreme intelligence designed the world but that this divinity does not engage in earthly matters – hence the importance of *tychè* as an inevitable component of human action.

It is thanks to the Hellenistic Jewish philosopher Philo of Alexandria (c. 13–c. 54), in *De opificio mundi* and of course *De Providentia*, that the concept of *pronoia* passes on to Judeo-Christian theology. Actually, it is no wonder that Jews, and then Christians, should reconsider the problem of providence from a new perspective, since the Bible grants mankind a central position and focuses on God’s historical interventions toward Israel, his elected people. However, except for the Book of wisdom (Wis 6, 7; 14, 3; and 17, 2), neither the Old Testament nor the New one really deals with the idea of a rational government of the world. Philo, therefore, plays a major role in emphasizing the harmony of the universe as a proof of universal providence, God being comparable to a just and careful *paterfamilias*. Philo thus establishes a far-reaching link between justice and providence, i.e., between soteriology, theodicy, and the idea of providence – a link which will become characteristic of the Jewish and Christian *Weltanschauungen*. In that view, providence is less a determinist order than a mode of God’s personal presence in the world and care for the world. For instance, in his *Civitas Dei*, the major early Christian theologian,

Augustine of Hippo (354–430), links the Stoician concept of providence with the problem of election: in this world or in the hereafter, God rewards the good and punishes the evil. *Pronoia* thus occupies a primary position in the early Christian thought: Christian freedom, which has to combine with God's rational ruling of the world, is opposed by the Fathers of Church (such as Clement of Alexandria and Origen) and the first scholasticism, to the pagan belief in *fate* (*heimarméne*).

Generally regarded as the founder of so-called "Neoplatonism," Plotinus (205–270) makes *pronoia* one of the main concepts of his philosophy, to which he dedicates a whole treatise (*Enneads* III, 2 et 3). Though influenced by the Stoics, his theodicy is more complex than theirs, since while for him the world's "soul," according to the Supreme Reason, is the drama director, each role must be interpreted by its own actor, which makes each human being responsible for his/her actions.

Also strongly influenced by Plato, Boethius (c. 480–524) introduces the far-reaching idea that God exists outside of time and is able in a single act of awareness to know all of the past, present, and future (*Consolation of Philosophy*, V, 6). Such omniscience preserves both God's timeless and absolute control over the world and man's freedom, since the vantage point from which God knows our decisions and actions is completely out of time.

In the twelfth century, while Averroes (1126–1198) breaks with anthropocentrism and presents an Aristotelian providence governing not the individuals but the whole sublunar world, in order to preserve all species, Maimonides' view on providence remains clearly anthropocentric: nature is "ruled" by chance, and only human beings are ruled by a God Judge, who rewards and punishes.

In the same period, Christian scholasticism inherits the ancient reflection on providence and makes it more systematic. For Aquinas, providence is the expression of God's will and intelligence, which applies to the whole universe as well as to particular beings and events (ST1a, q. 22, a. 2). However, being influenced by Averroes, Aquinas claims that God grants man "the dignity of causality" (ST Ia, q. 22, a. 3), distinguishing between primary and secondary causes.

In Medieval culture though, another concept is more prominent than *providence* in literary culture and iconography: *fortune*, which can refer to quite different agents, from an equivalent of *Providence* to a mysterious force, which influences human actions.

Innovative and Original Aspects During the Renaissance

However, in the Renaissance, under the influence of Reformation but also of "Neoplatonism" or natural philosophies concerned with material phenomena, the idea of *fortune* seems challenged, and *providence* makes a comeback, if a problematic one. Reformers are very wary of the popular belief in fortune and insist rather on the importance of God's direct intervention in life in the form of grace. Calvin especially insists on the theme of predestination. Therefore, the problematic relationship between theodicy and freedom becomes a central one for the entire early modern period. Undergoing a transformation from a widely accepted figure of European culture to something more akin to our modern *chance*, *fortune*, however, remains an important notion for those who refuse providence as an emanation of God's intention for the world.

But even for those who believe in providence, the concept is more and more challenged, especially in two main directions. First, for skeptics who revive the Epicurean tradition and are inspired by Lucretius, Lucian, the ancient Atomists thought, and sometimes Averroism, providence, if it exists, has little or no relation to the particular affairs of the single man. Second, for Reformers or Christians influenced by authors such as Montaigne, providence operates in ways bafflingly incomprehensible and hidden to human reason. This current is especially strong among Calvinists and in Elizabethan and Jacobean England, but it can also be related to the Augustinian feeling of a *Deus absconditus* which prevails later in seventeenth-century France. In this perspective, providence refers to seemingly arbitrary judgments of election and reprobation, which are beyond the reach of human reason or experience.

Those new representations of the relation between man and the heavenly powers tend to weaken the medieval sense of relative security, while a strong urge to find coherence in a troubled world still remains exemplified in particular by the writing of universal histories or cosmographies.

In some milieus of Renaissance Italy, a return to the Epicurean doctrine brings along the idea that to avoid superstitious fears and reach *ataraxia*, one has to understand that gods are absolutely indifferent to human concerns – which rules out the very notion of providence, in favor of a blind and fickle fortuna. This is exemplified by influential Machiavelli's *Principe*, which consequently emphasizes the importance of *virtù*, a purely human talent or ability directed toward the achievement of certain goals, which can sometimes defeat fortuna and is, therefore, the most vital quality for a prince.

The instability and unpredictability of the world and history lead many authors to adopt such an idea of fortune, which is especially obvious in reflections about natural calamities. For Filippo Beroaldo (*Opusculum de terraemotu* [*On Earthquake*], in *Varia . . . opuscula*, Basel, 1513, fol. 147), man's misery is caused by fortune's blind and arbitrary operations, and no real meaning, explanation, or remedy can be offered. Providence seems completely absent.

Another position, more mixed, is represented by Pietro Pomponazzi (1462–1525), sometimes called the “last Scholastic and the first man of the Enlightenment.” Pomponazzi submits free will (*liberum arbitrium*) to the determinism of natural laws and tries to combine this celestial determinism, which he views as Stoic, with the Christian views on providence and also to reconcile the indeterminacy of human freedom with the immutability of divine knowledge.

In Renaissance France, as in Italy, the ancient debate between Stoics and Epicureans seems to be played again, but it is fundamentally transformed by the Christian views on God's personal care for the world.

Quite paradoxically, a frequent disintegration of belief in providence is shown both by skeptical writings (through various guises due to the censorship) and in the pious attacks (from Catholics

and Protestants alike) against proponents of skepticism. In *Zeus Rants*, Lucian mocks those who give the name *order* to a blind tendency and *providence* to the natural order. Although influenced by Lucian, Erasmus, on the other hand, denounces his providential view as blasphemy, while this same view is adopted by Des Périers in his *Cymbalum mundi* (ca. 1529–1530), regarding the injustices of life. The Swiss Reformed theologian Pierre Viret, in his preface to the second volume of *L'Instruction chrétienne* (1564), is shocked by the “execrable athéisme” (“vile atheism”) of those who, like the Epicureans, deny providence – and he denounces their improving number. The refusal to believe in providence will remain the main mark of atheism well into the seventeenth century (sometimes associated with debauchery) by heralds of providence such as Loys Le Roy, in the dedication to his translation of Plato's *Phaedo* (1553). In *Les Trois Veritez* (Bordeaux, 1595), Pierre Charron includes among his three types of atheists, the Epicureans, who seem to have some deity but hold it to be careless of this world and of us.

Unsurprisingly, Epicurus' critique is especially harsh from defenders of the Christianity, who pursue the ancient Christian reflection on the way God's providence and man's free will can combine. While relying, through Ockham, on a tradition dating back to Nicolaus de Cusa's *docta ignorantia*, Luther insists on the unknowable (and sometimes inimical to man) nature of a *Deus absconditus* design, Jean Calvin is extremely harsh toward Epicureans, and so are Hyperius (1511–1564), a Flemish Protestant theologian – and the French Reformers Théodore de Bèze and Antoine La Faye's *Propositions and Principles of Divinitie* (Edinburgh, 1591). However, in his commentary on Seneca's *De Clementia*, Calvin is also very critical of the Stoics, whom he reproaches for taking all wisdom and free will from God, forgetting that His wisdom is incommensurable to man. Providence is a key concept in his theological framework, and he distinguishes three aspects of it in his *Institution of Christian Religion*: general providence, which rules the whole universe with the laws of nature; special providence, which specifically care about

mankind and human history; and very special providence, which only cares about the faithful and their salvation through different steps (history of Israel, coming of Christ, writing of the Bible, history of the Church). For him, providence is closely linked to predestination or to God's "secret counsel": all events in this world actually happen according to God's secret decision of saving some men and damning others.

Conversely, many theologians on the Catholic side emphasize human freedom while trying to reconcile it with divine sovereignty. The Jesuit theologian Luis de Molina's theory of middle knowledge is an audacious attempt to do so. Since God knows prior to His decision to create what any possible creature would do in any possible circumstances, God in deciding which creatures to create and which circumstances to bring about (or permit) ultimately controls and directs the course of world history to His desired ends yet without limiting in any way the freedom of His creatures. Providence is thus the ordering of things to their divine ends, either by God's direct action or, in a perspective inherited from Aquinas, mediately through secondary causes.

Though skeptical and providentialist positions seem irreconcilable, Montaigne, the most influential writer of Renaissance France, exemplifies the complexity of the debate – which in his work is increased by a frequent wavering between the words *providence*, *destiny*, *fate*, and *fortune*. Indeed, while Montaigne favors the word *fortune*, he also uses *providence* probably because when in Rome, Church authorities strongly suggested that he used this theologically correct term in place of *fortune*. However, for some reason, he does not feel obliged to avoid *fortune* in his later writings; not only does this term remain much more frequent in his *Essays* than *providence*, but Montaigne does not restrain from attacking divine analogy. In his disguised polemics against Sabunde's hymn to man's privileged and glorious status under God (*An Apology for Raymond Sebond*), he claims that the world is disordered and unpredictable. It is hard to know if this should be interpreted as a result of his disbelief, as his attachment to the poets' and humanists' views on *fortuna*, or of his unruly character – but the fact remains that he does treat *fortune* and *providence*

as perfectly compatible – perhaps precisely because for him, the ultimate truth is unattainable. By breaking down not only the traditional anthropomorphism of providence but also the dichotomy between fortune and providence and by giving new attention to chance and contingency (*hazard*), Montaigne thus contributes to a revision of the concept of providence as profound, in the long term, as the one produced by Renaissance skeptical ferments.

Ptolemy in the Renaissance

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Among the works written by, or attributed to, Claudius Ptolemy (ca. AD 100–ca. 170), those which enjoyed the warmest reception

in the Renaissance were: (1) the *Almagest*, (2) *De Analemmate*, (3) *Planetary Hypotheses*, (4) *Quadripartitum* and the (spurious) *Centiloquium*, (5) *Geography*, (6) *Planisphaerium*, (7) *Optics*, (8) *Harmonics*, and later (9) *Phaseis*, and (10) *On the Criterion (of Truth) and the Commanding-Faculty* with the *Canobic Inscription*.

Impact and Legacy

Among the works written by, or attributed to, Claudius Ptolemy (ca. AD 100–ca. 170), those which enjoyed the warmest reception in the Renaissance were: (1) the *Almagest*, (2) *De Analemmate*, (3) *Planetary Hypotheses*, (4) *Quadripartitum* and the (spurious) *Centiloquium*, (5) *Geography*, (6) *Planisphaerium*, (7) *Optics*, (8) *Harmonics*, and later, (9) *Phaseis*, and (10) *On the Criterion and the Commanding-Faculty*, with the *Canobic Inscription*.

1. Ptolemy's resurgence in the Renaissance had a deep and extensive impact on astronomy and cosmology. His *Almagest* (*Μεγίστη Μαθηματικὴ Σύνταξις*) regained an unparalleled centrality in these fields between the mid-fifteenth and the mid-sixteenth century. At first, the *Almagest* was studied in small circles of specialists, who soon became aware of the unreliability of Gerard of Cremona's translation from Arabic (Toledo, 1175). So, between the 1420s and the 1440s, scholars began to (re)study Ptolemy on the basis of the original text preserved in Constantinople: John Chortasmenos left a lot of notes and calculations in his copy of the *Almagest*; Bessarion hand-copied the *Commentary* by John Alexandrinus; and Gemistus Pletho studied the one by Theodore Metochites (cf. Rigo 1991). The intrinsic complexity of the text and the mathematics within it were made more accessible to students on various occasions: for instance, the anonymous *Almagestum Parvum* offered an abridged formulation of Ptolemaic astronomy in the style of Euclid's *Elements* (Zepeda

2015), while Giovanni Bianchini's *Flores Almagesti* (1446–1456), following Ptolemy's footsteps, disclosed innovative methods for the computation of stellar coordinates and mathematical astronomy in general (Van Brummelen 2018). In the West, however, such a re-discovery began precisely in 1451, when Pope Nicholas V commissioned George of Trebizond to produce a Latin translation of the *Almagest* based on a Greek manuscript from Bessarion's library. The Cretan scholar completed the requested translation by the end of that year; he also completed and attached his demanding commentary on that work, in which he extensively criticized the historic *Commentary* by Theon of Alexandria, in an effort to restore Ptolemy's original text by dispelling subsequent misunderstandings. Even though George of Trebizond tried to gain recognition and promote his work in Venice, Rome, Naples, Istanbul, and Budapest, his anti-Theonian *Commentary* became the target of a harsh polemical campaign fuelled by Cardinal Bessarion (Steiris 2010). The latter first exploited the negative evaluation of George's endeavor by the papal reviewer Jacopo Cremenese and then appointed Peurbach (soon succeeded by Regiomontanus) to discredit such a "heterodox" interpretation of Ptolemy's astronomical work in print. As requested, Peurbach started composing an *Epitome of the Almagest* (*Epytoma in Almagestum*) in 1460–1461, which was completed by Regiomontanus in 1462. Eventually, Regiomontanus also wrote a second text on Bessarion's behalf – the *Defensio Theonis contra Georgium Trapezuntium* (early 1460s–ca. 1474), where he not only criticized his polemical target, but also tried to solve what he considered to be inconsistencies or interpolations in the work of Ptolemy (Shank 2002). Here, between the lines of the polemic, one can detect the emergence of novel astronomical ideas, such as those pertaining to the order, distance, and motions of the planets, and the overall cosmic dimension, arising both from much-needed

- revisions of the *Almagest* and the collation of its contents with other sources – most notably, Campanus da Novara’s *Theorica planetarum* (Shank 2020). Significantly, Regiomontanus’ epitome was later used by Copernicus as a reference handbook in his studies, often even in preference to the *Almagest* itself (Swerdlow – Neugebauer 1984: 51). In both his *Commentariolus* and the *De Revolutionibus Orbium Coelestium* (1543), however, Copernicus shows his assiduous familiarity with Ptolemy’s *Almagestum*. As it has been noted, “Copernicus had studied the *Almagest* very carefully indeed. For the *De Revolutionibus* is the *Almagest*, book by book and section by section, rewritten to incorporate the new Copernican theory, but otherwise altered as little as might be” (Boas 1962: 74). Although Copernicus criticized Ptolemy’s lunar model (Goddu 2010: 154), his star catalog is entirely based on the data of the *Almagest*. That catalog would only be updated in 1598 by Brahe’s *Stellarum Inerrantium Restitutio* (Graßhoff 1990). Indeed, sixteenth-century astronomy can largely be described as an attempt to improve or correct Ptolemy’s observations (such as his views about the alleged path of the Sun, cf. Swerdlow 2010). As time passed, the improvements made were observational as much as philological. The first complete Latin translation of the *Almagest* was published in 1515. Grynaeus and Camerarius emended the Greek for the *editio princeps* of the text in 1538. Reinhold published an annotated Greek and Latin edition of the first book of the *Almagest* as a handbook for Wittenberg students in 1549 (*Ptolomei Mathematica Constructionis*, later printed as *Regulae artis mathematicae*), where he stuck to the traditional geocentric hypothesis notwithstanding Copernicus’ proposal (Omodeo and Tupikova 2013).
2. While some years later, in 1562, Ptolemy’s work on the mathematics of sundials (*De Analemmate*) was also published in an annotated edition by Commandino, Scholastic thinkers maintained their conservative approach to the subject of astronomy, in both their teaching and published works. To mention but one of the most telling cases, the Jesuit Christoph Clavius defended the validity and the reality of the Ptolemaic cosmological system from the first to the last edition of his highly influential textbook on Sacrobosco’s *Sphere* (1570/1612) against competing models, also resorting to sophisticated forms of logical reasoning (Haddad 2009). The Renaissance “*amor Almagesti*” did not fade away overnight.
 3. Ptolemy’s *Planetary Hypotheses* were drawn upon alongside his major astronomical work. They were translated by Matthias Bergius and completed by a different (anonymous) translator before 1587; another anonymous version circulated as *De suppositione planetarum before 1595; and finally*, John Bainbridge, who was appointed Professor of Astronomy at Oxford, published their translation under the title of *De planetarum hypothesibus liber* together with the Greek text (London 1620).
 4. In Renaissance times, Ptolemy also returned to being a protagonist of the cultural debate in the field of astrology. A direct engagement with his original texts was initially pursued as a means to bypass the medieval and Arabic tradition, whose hermeneutical, Neoplatonic, and sometimes magical overtones no longer matched the interest of its new students (Faracovi 2014: 87). Greater competence in the technical aspects of astronomical predictive models and a renewed philological sensibility prompted the need for a new translation directly from the Greek text of Ptolemy’s works. That is what happened with both the *Quadripartitum* or *Tetrabiblos* and the *Centiloquium* or *Karpus* (or *Fructus*), which was generally believed to be authentic (up to Cardano’s demonstration of its spuriousness in his 1554 commentary). The first to translate the *Centiloquium* into Latin was most probably George of Trebizond around the middle of the fifteenth century. His translation was later published in Rome by Luca Gaurico (in 1540), but anticipated in print by the translation – with a “naturalizing” commentary – by

Giovanni Pontano (Naples, 1512). In 1451, while in Naples, George of Trebizond completed the first translation of the *Quadripartitum*, produced with astrological and prophetic goals in mind (Steiris 2010: 192–194). Conrad Heingarter wrote a commentary on that work in 1477, Giorgio Valla another one in 1502. Pico della Mirandola took some arguments from Ptolemy's works, the *Quadripartitum* included, and turned them against astrology *tout court*. To this end, he frequently and deliberately undermined Ptolemy's authority in his *Disputationes adversus astrologiam divinatricem* (posthumously published in 1496), where he even retranslated, commented, and contrasted some Ptolemaic passages as part of his anti-astrological campaign (Rutkin 2020). Nonetheless, Ptolemy's *Quadripartitum* remained a common and widespread textbook in the university syllabuses for mathematics, medicine, and natural philosophy courses for more than another century (in Bologna, Padua, Ferrara, and Pisa, among other places). A more systematic translation of the first two books (out of four) was begun by Joachim Camerarius by working from a Greek text that he had newly established in 1535. The translation was eventually taken over and completed by Antonio Gogava in 1548. In 1553–1554, Philipp Melancthon revised and corrected the Greek text provided by Camerarius, retranslated all four books into Latin, and then published the new version by adding his own commentary, with the aim of bringing astrology back to its original purity. Furthermore, around 1574 Valentin Nabod completed another translation with a commentary, and later (after Conrad Dasypodius's additional translation of 1578) he published another work, the *Enarratio elementorum astrologiae* (Cologne, 1560), where he discussed Ptolemy's astrology in detail. In the expanded editions of his *Speculum astrologiae* (1581 and 1583), Francesco Giuntini translated and commented at length on Ptolemaic astrological works, among other authorities on the subject. During the academic year 1585–1586, Filippo Fantoni was still

reading, commenting on, and teaching Ptolemy's *Quadripartitum* (Rutkin 2010). Check after check, astrology was reformed, rather than undermined, on a more subject-informed basis through the return to a more philological understanding of Ptolemaic and pseudo-Ptolemaic works. As a sign of long-term persistence, we still find a new technical, annotated edition of Ptolemy's *Quadripartitum* in 1658: it was published by Placido Titti in Padua, the very place where Galileo had been working 50 years before (see Hasse et al. 2016 for a more comprehensive overview of the Latin reception of Ptolemy's astrology and astronomy).

5. The process of enhancing the understanding of Ptolemy's *Geography* was a major intellectual event of the Renaissance (Gautier Dalché 1999: 286), too. That work provided a realistic overview of inhabited lands and also offered geometrical and mathematical methods to fill the extant gaps in the geographical knowledge of the terraqueous globe. Moreover, Ptolemy's view of the world was consistently integrated into a “greater picture.” For, “thanks to its astronomical basis, the *Geography* fitted into the cosmographic pattern of the Renaissance thought, since it underscored the points of interdependence between the organization of the celestial and the terrestrial map: Ptolemy's *Geography* confirmed the [mathematical] correlation between the constant motion of the stars and sublunary world” (Shalev 2011: 9).

Ptolemy's *Geography*, however, was not completely forgotten by Western scholarship before the formal (re)acquisition, or “re-exhumation,” of the Greek text in Byzantium at the end of the fourteenth century (Pastoreau 2012; Gautier Dalché 1999). From Late Antiquity and the Early Middle Ages onwards (if we include the Islamic elaboration of the work), interest in the spatial coordinates of cities and places mentioned there remained alive. Indeed, this information was often used for the astrological “geo-localization” of the heavens' influences on

the earth and, in turn, for sanitary prognostications (Id. 2009). After all, “Ptolemy’s *Geography* was construed as a work belonging to the cosmic system described in the *Almagest*, and thus it came to be used for astrological purposes. This use is explained by the close association between the toponymic lists of the *Geography*, with their coordinates, and the equivalent synoptic lists in Ptolemy’s basic astrological manual, the *Handy Tables*” (Shalev 2011: 10). Aside from this, early Humanists such as Petrarch and Boccaccio were very much interested in identifying places mentioned by Greek and Roman authors under later-forgotten toponyms, so at first ancient works on geography were taken into the highest consideration for antiquarian interest blended with place-name curiosity (Gentile 2013).

The text of Ptolemy’s *Geography* was identified and retrieved in Constantinople by the Byzantine philologist Maximus Planudes in 1295. Following indications within the text, he was able to have the no longer extant maps drawn anew and donated a copy of the recreated manuscript to Emperor Andronikos II Palaiologos (Dilke 1987: 268). Cardinal Bessarion wanted this work to be copied in a luxury illuminated version (now *Marc. Gr.* 31 in the Marciana Library, Venice). However, Ptolemy’s *Geography* first reached Italy in 1397, when the Constantinopolitan ambassador and erudite scholar Manuel Chrysoloras visited Florence. He was invited as a teacher by the Humanists Coluccio Salutati, Palla Strozzi, and/or Jacopo Angeli. He brought many books with him for his assignment. Among these was a codex that, among other scientific treatises, contained a transcription of the *Geography*, or *Guide to Cartography* – as the original title reads there. Chrysoloras intended to use it as textual support for teaching the Greek language. The literal Latin translation of the book was begun by Chrysoloras himself, but the project was then taken over by his student Iacopo Angeli da Scarperia in 1401 and brought to completion in Rome in 1409. Once

completed, the translation was dedicated to Pope Alexander V under the title of *Cosmographia*. While this Latin translation was later to be judged inadequate, imprecise, and incorrect in many respects, it remained in use as the only available one for more than a century. From that moment onwards, the text underwent a long and nonlinear process of “cultural transfer” via subsequent transformations, adaptations, corrections, interpolations, appropriations, remakes, and distortions (Vagnon 2003) across Europe. Such a complex process, almost paradoxically, began with the quest for philological fidelity with respect to the original text.

Niccolò Niccoli, Paolo dal Pozzo Toscanelli (who also commented on the *Almagest*), and the circle of Humanists who gathered in the halls of the Monastery of Santa Maria degli Angeli in Florence prompted the revival of Ptolemaic studies by focusing on the recovered text and especially on its toponymic nomenclature. Among these scholars, Francesco di Lapacino and then Domenico Buoninsegni translated the place-names found in the attached maps for the purpose of precisely identifying where Classical authors had set their ancient narratives. The text of Andrea da Barberino’s chivalric poem *Guerrin Meschino* (1410/1420) bore early traces of Ptolemaic place-names, which were arguably included via vernacular adaptations for the only purpose of tickling the Florentine audience’s imagination with the sounds of remote and exotic locations. It is clear, then, that even at this time Ptolemy’s *Geography* was still mainly consulted as a reference source for ancient and almost-forgotten place-names, if not as a fictional travel guide or an object of wonder. In dedicating his translation to the Pope, however, Angeli stressed the importance of more technical aspects emerging from the Ptolemaic text, such as the notion of scale, mathematical imaging, spatial coordinates, the bidimensional projection, or flattering transposition of sphericity to the plane besides the methods entailed, also – indeed, primarily – for astronomical and astrological purposes. It was not by chance that Pierleone of Spoleto,

physician to Lorenzo de' Medici, kept a copy of Ptolemy's *Geography*, alongside the *Almagest* and the *Quadripartitum*, in his personal library. The issue of how to represent the earthly globe on a bidimensional surface was a particularly debated one in France, where it was notably discussed in Pierre d'Ailly's *Compendium Cosmographie* (1410/'15), Guillaume Fillastre's *Commentary on Pomponius Mela* (1417), and Jean Fusoris' *Traité de cosmographie* (1432). All these works integrated the transmission of Ptolemy's *Geography* with new information as well as with newly recovered ancient data. At the same time, in German-speaking countries, interest in the *Geography* was mainly driven by astronomical and astrological requirements, as can be appreciated by considering the works of Johannes von Gmunden and Georg Münstinger. It was thanks to the work of Johannes Stöfler and his student Sebastian Münster in Tübingen that the study of the *Geography*, conducted in an astronomical context, merged with the technical expertise of map-making.

Ptolemy's *Geography* came with 26 regional maps and a map of the *oecumene* or known inhabited world. These maps were soon reproduced and updated, starting with the work of Florentine painter Pietro del Massaio. They were eventually improved upon in many respects and integrated with new maps (the so-called *carte nouvelle* or *tabulae moderne*) – also on the basis of Claudius Clavus's and Nicholas of Cusa's early maps of Northern European countries – by Nicolaus Germanus in the copy of the *Cosmographia* that he made while in Florence for Borso d'Este, the Duke of Modena, Reggio, and Ferrara (1467). A selection of city maps was also added in his later editions that were all dedicated to Pope Paul II. Francesco Berlinghieri, on the contrary, preferred to maintain a more conservative approach in the cartographic section of his rhymed *Septe giornate della Geographia* in vernacular (Florence 1482, but for 15 years in the making), more in accordance with the philological fidelity pursued by Toscanelli's

circle. Ptolemaic maps began to adorn the pages of luxury, large-format copies of *Cosmographiae*, as well as the walls of *studia* and Wunderkammern (Van Duzer 2014).

An isolated, hybrid case that stands out from the Florentine *milieu* of redefinition of the *Geography* is provided by a Venetian codex from ca. 1436/1450, in which the Ptolemaic place names are compared with the Plinian nomenclature and maintained upon new nautical maps of coastlines (Milanesi 1996; see also Cattaneo 2004). Analogously, in his *Atlas* (1436) seaman Andrea Bianco integrated the Ptolemaic world map with both a circular *mappamundi* and Portolan charts based on his maritime expertise. Fra' Mauro's *Mappamundi* (1448/1453) criticized the Ptolemaic model without hesitation, setting it in contrast to the reported eyewitnesses and marine cartography in use at that time, in order to devise a more inclusive representation of the known world. On the other hand, Battista Guarini's *De ordine docendi ac studendi* (1459) claimed that it was impossible to study geography without the aid of the "*pictura Ptolomei*." Heinrich Hammer (or Martellus) followed Germanus's improved projection system in his three manuscripts of Ptolemy's *Geography*, where he also inserted historical-geographical notes taken from other ancient authorities, such as Pliny and Marinus of Tyre. Flavio Biondo declared that the geographical knowledge provided by Ptolemy was all but complete (1453). Cyriacus of Ancona and Gemisthus Pleton claimed that the shape and the size of the inhabited world as described by the *Geography* were quite unlikely: the former reached this conclusion by the way of his field explorations, the latter by comparison with Strabo's testimony. Within this general revisionist context, Christopher Columbus obtained a copy of the first Latin edition of the book (the Vicenza *princeps* edition of 1475), which was printed without the maps, so that he might also critically consider Ptolemy's continental distances while drawing his own maps and planning his epoch-making voyage

(Dilke 1992). Therefore, Ptolemy's *Geography* indirectly contributed to the belief that the maritime distance between Europe and Asia was not so great as to be impossible to cover.

Thus, despite the authoritativeness of the established model, new factors were increasingly leading to a radical reconsideration of the newly recovered Ptolemaic geographical paradigm. These factors included – to list just some of them – accounts from incoming native travelers contradicting the ancient texts, the consequent disproof of claims concerning that the torrid zone and the austral hemisphere of the earth were uninhabitable, the inconsistencies gradually detected within the *Geography* itself, new and more precise positioning data provided by astronomers and nautical explorers, the rediscovery of various earlier authorities as sources of geographical knowledge besides Ptolemy, and the spread of new travel writings and reports. Renaissance cartographers slowly realized with dismay that Ptolemy might have been “wrong” too. It has aptly been remarked, however, that “the movement of critical reception of the *Geography* must not be interpreted as the improvement of Ptolemy as conducted in accordance with his own model” (Gautier Dalché 2009: 337 our transl.; see also Id. 2007: 285–287). Hence, its history should not be retold – as has often been done in the past – as a process of gradual approximation of the present ideal of “exact” spatial representation.

The history of the reception of Ptolemy's *Geography* would have been very different if Regiomontanus had managed to publish all the works that he intended to print on the topic, as he declared in 1473. These included his textual notes against Angeli's translation, his own new annotated translation, a *Descriptio totius habitabilis notae* with maps and, finally, the *Commentaria magna in Cosmographiam Ptolemaei* with an explanation about the use of the *meteoroscopium*, the instrument that Ptolemy had used to measure geographical latitude and longitude (Malpangotto 2008: 151–153). The Veronese

Humanist Domizio Calderini revised Angeli's first translation, edited the Latin text from various manuscripts, and corrected some of its mathematics; his work was completed and published by the Benedictine Arnold Bucknick (Rome 1477). In 1506, Bernardus Sylvanus amended the text of the *Geography* and touched up its numbers to make them more consistent, although he did not attribute any mistakes to Ptolemy but only to the manuscript tradition.

A telling example of the process of redefinition of the Ptolemaic geographical model is the “terrestrial theory,” as illustrated by Lopo Homem's *Mappamundi* in Miller's *Atlas* (1519). Here the Atlantic Ocean is shown as a *landlocked* sea, envisaged just as the Indian (open) sea is in Ptolemy's *Geography*, that is, as a basin, or enormous lake, entirely surrounded by terrestrial regions (see Fig. 1). Indeed, the lands found on the other side of the Atlantic were identified as being part of Asia; so, at this stage, the tendency was to “close” the margins of the water-mass along both its northern edge and its southern one, in accordance with the Ptolemaic idea of the earth as *Orbis conclusus* (Relaño 2003). The Ptolemaic belief in terrestrial continuity was not easy to dismiss before Ferdinand Magellan and Juan Sebastián Elcano's circumnavigation of the earth (1519–1522).

Willibald Pirckheimer retranslated Ptolemy's *Geography* for the first time after Angeli had produced his own translation more than a century before (Strasburg 1525), perhaps also consulting Regiomontanus' unpublished drafts. Peter Apianus published the *Cosmographiae introductio, cum quibusdam Geometriae ac Astronomiae principiis ad eam rem necessariis*, which can be considered the first printed handbook for teaching and learning the rudiments of Ptolemaic geography (Ingolstadt 1529; Venice 1533). The first critical edition of the Greek text was the one compiled by Erasmus shortly afterwards (Basel 1533).

Giambattista Ramusio's *Delle Navigazioni e Viaggi* (3 voll., Venice 1550 and ff.) paved

Ptolemy in the Renaissance, Fig. 1 Lopo Homem, *Mappamundi. Hémisphère portugais*, in “Atlas Miller” (1519). Bibliothèque nationale de France, Ge D 26179 Rés. Central round selection [Public domain image]

the way for a new, or “substituted,” Ptolemy to deal with the unprecedented expansion of the geographical subject (Milanesi 1984). Portuguese literary works such as Luís Vaz de Camões’s *Os Lusíadas* (1572) and F. Mendes Pinto’s *Peregrinação* (posthumously published in 1616) share the same transitional nature: while grounding their descriptions in a Ptolemaic view of the world, they go beyond the Ptolemaic text and lead their readers to places that were unknown to Ptolemy and his followers (Gunn 2018).

The end of the Renaissance *fortuna* of Ptolemy’s *Geography* can be conventionally said to coincide with the publication of Gerard Mercator’s volumes, which neatly distinguish modern maps from Ptolemaic ones as independent representations of the geographical space (1578).

6. A peculiar intersection between the Ptolemaic system of geographical projection and the figurative arts can be found in the

Renaissance study of perspective. Leonardo da Vinci devised his *prospettografo* with the third method of projection described by Ptolemy’s *Geography* (Valerio 2012), while Leon Battista Alberti developed his “pre-Cartesian” arrangement of pictorial compositions according to the same principles based on spatial coordinates and perspectival reticulation (Veltman 1980). A similar convergence of interests can also be seen in Federico Commandino’s edition of Ptolemy’s *On Flattering the Sphere* or *Planisphaerium* (Venice 1558), where his commented translation is followed by a study on linear perspective.

7. Ptolemy’s *Optics* was less known than Euclid’s *Optics* in the Renaissance because it only survived in an incomplete Latin translation made in the twelfth century by Eugene of Sicily from a no longer extant Arabic version. Roger Bacon, however, treated Ptolemaic optics as complementary to Euclidean

and Arab (Alhacenian) optics – and he was not the only scholar to adopt such a syncretistic approach to the matter. A second reason why the *Optics* did not have the impact it deserved to have was probably the fact that it seemed too sophisticated to its readers, since it also covered the subjects of catoptrics (light reflection) and dioptrics (light refraction) with empirical examples or experiments, yet without the proper mathematical understanding. Attempts were nonetheless made to replicate those experiments (e.g., by Leonardo), in order to define the underlying theory. Improvements in glass technology later also played a role in this. Christoph Scheiner's and Christiaan Huygens' experimental explanations for binocular vision can be traced back to Ptolemy's text, partly via Ibn al-Haytham (Raynaud 2016). Moreover, Ptolemy endorsed the "extromissive" theory of vision, according to which the line of sight physically starts from the eye – a theory that was often studied in detail, but which not everybody was inclined to accept. Renaissance artists and painters took advantage of a couple of modeling techniques (aerial perspective and the perspective from an elevated viewpoint) that Ptolemy reported in his *Optics* (II, 123–125) as geometrical tricks to create the illusion of *trompe-l'œil* depth in bi-dimensional representations. "Of Ptolemy's *Optics* – it has been concluded – we currently know of 15 manuscript-versions, 11 of them dating from after the fifteenth century... [T]he *Optics* was being reproduced at this time not out of historical interest but out of a continuing lively interest in its theoretical content... In fact, publication of Ptolemy's *Optics* was contemplated twice (but never brought to fruition) during the Renaissance, once by Regiomontanus, in the later fifteenth century, and once by Georg Hartmann, in the early sixteenth" (Smith 2001: 156 and n. 20). It should also be mentioned that Moerbeke's translation of an apocryphal work on mirrors wrongly attributed to Ptolemy (and known as *De speculis*) was printed in Venice in 1518, together with

other texts on optics. The manuscript version of that text was used, alongside Ptolemy's *Optics*, by Witelo as a reference for his influential *Perspectiva*. Kepler himself developed his basic refraction theory by drawing upon the work of Witelo, Alhacen, and other perspectivists, who in turn ultimately derived their tabulations from Ptolemy.

8. Next, Ptolemy's *Harmonics* regained an equal, if not even superior, *fortuna*. The text, with Porphyry's commentary, was originally recovered in Byzantium around the tenth century and then probably reached Italy via Venetian collectors in the fifteenth century. A copy of Ptolemy's "Musica," that is, *Harmonics*, was spotted by Ambrogio Traversari in Vittorino da Feltre's library in Mantua as early as 1433. Giorgio Anselmi's *De musica*, which appeared one year later, betrays direct or indirect knowledge of Ptolemy's *Harmonics* in regard to the theory of musical harmony within the cosmos.

Ficino read Ptolemy's *Harmonica* in manuscript form, as is suggested by his commentary on Plato's *Timaeus* (1496), in particular the passage where he projects the diatonic scale upon the circle of the zodiac.

In the third book of *De expetendis et fugiendis rebus opus* (1501), Giorgio Valla quoted Ptolemy on musical matters. Carlo Vargulio criticized Ptolemaic harmonics in the introductory essay of his Latin translation of Plutarch's *De Musica* (1507).

At the end of the fifteenth century, Franchino Gaffurio (or Gafori) commissioned Nicolò Leoniceo to produce a translation of Ptolemy's *Harmonica* from the Greek, which was eventually presented to Pope Paul III by Gian Giorgio Trissino. Previously, Gaffurio had mentioned Ptolemy as a referential authority in his *Theorica musicae* (1492, rev. ed.), but at that time he could not have a proper understanding of the text – as is also proved by the early and inaccurate interpretation of the primary source provided in his *Practica musicae* (1496). Nonetheless, his *De harmonia musicorum instrumentorum opus* (written in 1500 and published in

1518) was closely modeled on Ptolemy's *Harmonics*, from which he even derived some ideas about the relation between the sounds produced by the spheres and the resonances of corresponding parts of the human soul (making astrology, music, and psychology closely related). References to the Ptolemaic harmonic relations of the cosmos and its arithmetical/musical arrangement can also be found in Francesco Zorzi's *De harmonia mundi totius* (1525).

In his *Musica theórica* (1529), the autodidact Ludovico Fogliano developed a theory of intonation alternative to the Pythagorean one and grounded in the diatonic syntonon (intense or syntonic tuning) of Ptolemy's *Harmonics*, as Pietro Aaron had already done in *Libri tres de Institutione Harmonica* (1516) and Nicola Vicentino was to do in *L'antica musica ridotta alla moderna prattica* (1555).

In *Istitutioni harmoniche* (1558) – one of the most original and influential texts in the history of music – the Venetian *maestro di cappella* Gioseffo Zarlino established that tonal system as the new theoretical basis for Western tuning. The adoption of Ptolemy's diatonic syntonon enabled Zarlino to resolve the main problem in Renaissance music, both by reforming the Pythagorean-Boethian tradition from within and by adapting it to the musical praxis of his time. Consequently, the ancient Ptolemaic musical ratios and nomenclature were adopted as the referential standard intonation, which has remained in use up to this day (Haar 2006: 26–27).

In those years, Ptolemy's name appears in the publishing plans for translations (or re-translations) of ancient and modern musical writings drawn by the Accademia Veneziana della Fama.

One of Zarlino's students was Vincenzo Galilei, who studied Ptolemy's musical theory as well and compared it with alternative ones. In his *Dialogo della musica antica et della moderna* (1581), he engaged in a dispute against his teacher, where the point of contention was also the use of Ptolemy's tonal

system in vocal music. (Zarlino later responded with his learned *Sopplimenti musicali* (1888), which makes it clear that he extensively consulted Ptolemy and other musical sources of antiquity in his life-long study of the subject.)

Girolamo Mei, one of the best-informed Renaissance scholars when it comes to ancient Greek music, claimed: “[among all the ancient authors who wrote on the musical science] I have resolved to take as my foundation Ptolemy, for I judge him to be the more exhaustive and conclusive of all,” although his surviving work – as he recognized – was still unavailable in its entirety (*Letter to P. Vettori*, 21 February 1562; see Palisca 1985: 265–266). However, that very year Antonio Govara published a Latin translation of Ptolemy's *Harmonicorum libri III*. Accordingly, in his *De modis musicis antiquorum* (circulating as a manuscript in Florence from 1573), Mei restored the Ptolemaic tonal system on new philological bases, against Boethius' enduring misunderstanding.

In his *Lecture in defence of Ariosto* (1583), Giovanni de' Bardi quoted Ptolemy to support the thesis that music is defined by verse, rhythm, and pitch, which should also govern true poetry.

After the Latin translation provided by Antonio Gogava (1562), Ercole Bottrigari claimed to have completed an Italian translation of Ptolemy's *Harmonica* in 1597 together with other ancient musical writings (although these texts are no longer extant).

Descartes' *Compendium musicae* (1618) is Ptolemaic in its essence. The long-term impact of Ptolemy's theory of harmonic proportion (syntonic diatonic) as applied to cosmology extends to Kepler's *Harmonice Mundi* (1619), where the author improved the original musical-based theory of consonance with his own theory of geometrical congruity. Even in Riccioli's *Almagestum Novum* (1651), specifically in book IX, sec. 5: “*De Systemate Mundi Harmonico*,” the relation was still discussed at length. Finally, in his *Philosophical Origins of Gentile Philosophy* (1683), Newton accused

Ptolemy and other gentile philosophers of having mystified the original Pythagorean wisdom, which had properly disclosed the secret of the harmony of the spheres, albeit in the form of myth.

9. The French Jesuit Denis Petau translated Ptolemy's *Phaseis* and published it under the title of *De apparentiis inerrantium et significationibus* as part of his *Uranologium* (Paris 1630), together with his *editio princeps* of the Greek text in two columns.
10. The astronomer and mathematician Ishmaël Bullialdus retrieved Ptolemy's *On the Criterion and the Commanding-Faculty* and the *Canobic Inscription* while working at the Royal Library of France. He completed their Latin translations, and published them along with the original texts, as *De iudicandi facultate et animi principatu* and *Inscriptio Canobi ad ipso consecrata* (Paris 1633). He published these works by Ptolemy – especially the former – with the declared intent of opposing Descartes' physicalist psychology (Long 1988: 178–179).

Puritanism in the Renaissance

Rosamund Oates

Manchester Metropolitan University, Manchester, UK

Abstract

Puritanism was a strain of English Protestantism that emerged after the reestablishment of the Protestant Church of England by Elizabeth I in 1559. Puritanism was not a coherent set of ideas, but rather a form of intense piety that led many to criticize the Church of England for not being as Reformed as Calvinist Churches on the continent. As such, Puritans and Puritanism changed in light of changing religious and

political dynamics in Early Modern England, becoming an increasingly political force under Charles I and leading to the English Civil Wars. Different Puritans promoted different models of a spiritual society in order to realize their ideals including conforming to the established Church, Presbyterianism, or separation and exile to America. What was constant, however, was a commitment to personal spiritual growth that produced an influential genre of writing on practical divinity.

Innovative and Original Aspects

Puritans were English Protestants whose intense piety led them to criticize the Protestant Church of England established by Elizabeth I (r.1558–1603) as being only “halfly-Reformed.” Inspired by Calvinist Churches abroad, English Puritans criticized Catholic practices remaining in the Church and condemned any attempts at reconciliation with Catholics later made by James I (r.1603–1626) or Charles I (r.1626–1649). The mixture of spiritual and political concerns created deep divisions in English society, leading to the Civil Wars (1642–1651), the execution of Charles I (1649), and the English Commonwealth and Protectorate (1649–1660) (Coffe and Lim 2008).

Running throughout any account of Puritanism are the twin themes of piety and opposition, as Puritans struggled to realize their vision of spirituality in Early Modern England. English Protestantism drew on the work of Jean Calvin (1509–1564), the French Reformer and theologian, and his followers. Particularly important was Calvin’s idea of predestination, namely that God had already chosen to save some people (the elect) while others were damned. Peter Martyr Vermigli (1499–1562) and Theodore Beza (1519–1605) argued that the elect needed to live spiritual lives and that this was a consequence of their justification (their preordained salvation). The English Puritan William Perkins described this spiritual living as “sanctification” or “the habit of righteousness,” and this concept was at the heart of Puritan spirituality. Puritans

believed that sanctification took place in a community and also that it was an urgent imperative (Patterson 2014; Tyacke 1987). Puritans thought that every one of their actions either increased spiritual growth or actively hindered it, they could not conceive of an action that was “indifferent” or spiritually neutral. This produced an intense and often introspective piety. It also drove Puritan criticisms of the Church of England as they saw Catholic remnants in the Church of England like the use of surplices as a real and present danger to spiritual growth. (Oates 2012; Coolidge 1970).

The Church of England retained many elements of medieval Catholicism including practices like kneeling at the Eucharist, Cathedrals, and bishops. Puritan clergy (including some bishops) tried to reform the Church through parliament during Elizabeth I’s reign, and when that failed through a series of polemical pamphlets, most notably the Marprelate tracts in 1589. In 1603, the Calvinist King James I succeeded Elizabeth I, raising Puritan hopes for further reform in the Church, but the Hampton Court Conference that met in 1604 endorsed the status quo (Collinson 1971, 2013). When James’ successor, Charles I, adopted a conciliatory policy toward Catholics, Puritanism became increasingly identified with a political opposition to the King. Historian John Morrill described the Civil Wars that erupted during Charles I’s reign as the “last wars of religion” as the struggle to control the religious destiny of the country erupted into violence (Morrill 1984; Como 2004; Prior and Burgess 2011). Oliver Cromwell, a leader of the opposition to Charles I during the Civil War and later Lord Protector of England, came from a radical Puritan tradition and tried to establish a godly commonwealth in England.

Impact and Legacy

Puritanism was a spiritual impulse rather than a coherent program of action and produced different ideas about the best way of organizing a Church and society. Some English Puritans embraced Presbyterianism, drawing on the example of

Calvinist Churches in Geneva and neighboring Scotland. Some English Puritans became convinced that attending services of the Church of England compromised their souls, and in the seventeenth century several Puritans separated from the Church of England. These Puritans emigrated to escape persecution by the Church authorities, going first to the Netherlands and then to New England where they were known as the “Pilgrim Fathers.” But for much of this period, Puritans stayed in the established Church of England trying to secure change from within. They channeled their piety into spiritual living or “sanctification,” and English Puritans produced guides to practical divinity that were influential across Europe. Preaching was at the heart of Puritan culture along with bible reading and self-examination. Their concern with sanctification was not only frequently caricatured in popular literature but also encouraged Puritan men and women to constantly strive for spiritual growth, whatever the political or social cost (Bremer and Webster 2006; Durston and Eales 1996; Lake 1983; Ryrie 2013; Webster 1997).

► Dupuy, Claude

Puttenham, George

Born: 1529, London?

Died: 1590/1591, London

Florence Hazrat

Cambridge, UK

University of Sheffield, Sheffield, UK

Abstract

George Puttenham was a courtier and writer during the reign of Queen Elizabeth I (1565–1603).

His major work, *The Arte of English Poesie* (1589), was published anonymously but is almost certainly by Puttenham. It is a handbook on poetry and rhetoric, offering the aspiring courtier advice on how to write well. It summarizes familiar concepts of poetry as civilizing art and argues for the vernacular's worthiness as a literary language. The book's

greatest contribution is a list of figures of speech together with original English terms.

Biography

Puttenham was probably born in London in 1529, nephew of the famous courtier and writer Sir Thomas Elyot. He was educated at Cambridge and the Middle Temple. Of his subsequent career little is known other than his continental travels and a long and fruitless battle with his former wife over their wealth and goods. Puttenham published nothing apart from his *The Arte*, though there exist two widely circulated works in manuscript ascribed to him. The “Partheniades” is a set of 17 encomiastic poems dedicated to the queen dating from around 1579. The prose letter “A justificacion of Queene Elizabeth in relacion to the affaire of Mary queene of Scottes” (c.1588) defends the execution of Mary through detailed legal and political proof. The author of *The Arte* mentions several other works, including drama, a verse romance, and some prose tracts, none of which have survived.

Innovative and Original Aspects

The Arte of English Poesie, entered at the Stationers’ register in 1588, was anonymously published in the subsequent year. It bears a dedicatory letter to Lord Burghley by the printer who claims no acquaintance with the author. The book is generally, though not indubitably, ascribed to George Puttenham. *The Arte* emerges from both classical and recent continental thought on literary criticism and composition, arguing for poetic expression in the vernacular worthy of Greek and Latin. It interlaces practical advice on writing with historical observations, stories of contemporaries, and suggestions on courtly conduct in a chatty, sophisticated style. Throughout, Puttenham offers literary examples, usually his own or English verse stemming from the 1550s to the 1570s. The text is divided into three books: Book One, “Of Poets and Poesy,” proposes verse as a key impulse to civilization, rehearsing

familiar founding myths of society, including the singers Orpheus and Amphion. Book Two, “Of Proportion Poetical,” explores poetic form from stanza length and rhyme, to prosody, and shape poems. Book Three, “Of Ornament,” presents Puttenham’s claim to fame with his list of originally Englished tropes and schemes. Artful cunning in the craft of language composition is celebrated and elevated to potentially political action at court.

Impact and Legacy

Owing to the lack of further editions or citations in other literary works of the period, it is hard to judge the influence of *The Arte of English Poesie*. It is perhaps more useful to consider the book, not in terms of its impact *on* writing, but the status it accords *to* writing: intertwining the aesthetics of conduct and of words, *The Arte* transparently argues for radical social mobility through rhetorically sophisticated use of language. It remains a major reference work as the distillation of mid-Elizabethan literary criticism as well as serving as a practical guide to written composition.

Quevedo, Francisco de

Born: Madrid, 14 September 1580

Died: Villanueva de los Infantes, 8 September 1645

Hilaire Kallendorf

Department of Hispanic Studies, Texas A&M University, College Station, TX, USA

Abstract

Francisco de Quevedo y Villegas was the most popular Spanish author of his century. He was also a consummate humanist and pioneer of the literary movement known as Baroque *conceptismo*. His primary contribution to

philosophy falls into the realm of Neostoicism. When seeking classical models for his own Neostoical works, he showed a strong preference for Latin Silver Age authors. His legacy is a unique blend of classical pagan philosophy and Christian teaching, a synthesis most appropriately described by the label Christian Humanism.

Biography

Francisco de Quevedo y Villegas was the most popular Spanish author of his century. Before 1634, his work had already appeared in 78 editions – more than twice the number of any other author. Quevedo was also a man of vehement opinions. As one prominent *quevedista* has remarked, he attacked Cicero, Tacitus, the Genoese, Protestants, Jews, Moriscos, women, and homosexuals while defending Homer, Epicurus, the Stoics, Spain, its patron saint Santiago de Compostela, and his own patron the Duke of Osuna. As a result of his violent loyalties, there has been much critical discussion of the “two Quevedos”: one lyrical, long-suffering, and devout and the other nasty, cynical, and abusive. Without entering into inconclusive posthumous psychoanalysis, it is nonetheless possible to see his massive *corpus* of works as including writings relevant to both ends of this spectrum.

Clubfooted and shortsighted, Quevedo was born in 1580 to a family of minor nobility; his

parents were secretary and lady-in-waiting to Princess María. When his father died 6 years later, he became the pupil of Agustín de Villanueva, a noble government official. As a young man, he studied with the Jesuits at the Colegio Imperial in Madrid, where he was able to escape from his mother whom he hated. He later went on to study classical and modern languages and philosophy at the University of Alcalá (1596–1599) and theology at the University of Valladolid (1601–1605). It was during his time in Valladolid that he began both his enmity with the poet Luis de Góngora and his Latin correspondence with Justus Lipsius. It was also during this time that his first poems appeared in print. From 1605 to 1609, he participated in various poetic academies at court, such as that of Count Saldaña, and wrote several of his satirical prose works, including the picaresque novel the *Buscón*. In 1610, he was denied the permission to print his *Sueño del juicio final*; the censor, Father Antolín Montojo, called its style “imprudent.” In 1613, he seems to have suffered a personal crisis in which he resolved to write more “prudent” works based on the Bible or the classics, a decision which resulted in such endeavors as *Lágrimas de Hieremias castellanas* and *Heráclito cristiano*.

From 1613 to 1618, Quevedo’s so-called Italian period, he served in various government functions – particularly under the Viceroy of Naples, the Duke of Osuna – in Palermo, Sicily, Rome, and Naples. His Italian period had a profound impact on his humanistic ambitions. We know from Lope de Vega’s detailed description of the literary atmosphere at court in 1608–1609 that Quevedo had been making no secret of his project of imitating Statius and other Silver Age authors. His stay in Italy strengthened this preference in his reading and the tendency in his writing to imitate these classical figures. During this time, he participated in the activities of the Accademia degli Oziosi in Naples, and since the Silver Age poet Statius himself had been a Neapolitan, Quevedo undoubtedly enjoyed the opportunity to continue working on his own *silvas* in this setting.

Upon his return to Spain, Quevedo became a knight of the Order of Santiago, but following quickly upon the heels of this honor were several tokens of political disgrace. His fortunes fell with

those of his mentor, the Duke of Osuna; after trying to defend the Duke in 1618 before the Council of State against the charge of having participated in the Conspiracy of Venice, Quevedo was banished to his country estate, the Torre de Juan Abad. He was imprisoned for some time in Uclés but then allowed to return to his country home under house arrest. When he became ill, he was allowed to go to a monastery in Villanueva de los Infantes. In 1623, he was back at court, trying to salvage his political career by writing overtly political works in favor of the king’s new minister, the Count-Duke of Olivares. In 1626 and 1627, to his great distress, three of his most popular works – the *Política de Dios*, the *Buscón*, and the *Sueños* – were pirated by the booksellers Roberto Duport and Alonso Pérez, in Zaragoza and Madrid, respectively. In 1628, he was banished again, perhaps because of his active involvement, through the publication of pamphlets, in the controversy over which saint – Teresa or Santiago, with Quevedo favoring the latter – would be the patron of Spain.

Refusing to learn his lesson about engaging in pamphlet wars, in 1631, he published two satirical pamphlets denouncing the deliberately obscure style and irrelevant classical allusions of his foremost literary rival, Luis de Góngora. These two pamphlets, *La culta latiniparla* and *Aguja de navegar cultos*, argue against the elaborate, obfuscating *culterano* style in favor of *conceptismo*, a more direct humanistic attempt to imitate the classics in terms of concepts or matter as well as manner. Quevedo’s use of his pen to participate in the political as well as literary controversies of his day (in all, he wrote 19 overtly political works) did not escape the attention of the authorities. In 1632, he was appointed to the nominal post of secretary to the king, but in the same year, his pre-1631 works, in both authorized and unauthorized editions, appeared on the Index of Prohibited Books “until such time as their true author recognizes them as his own, corrects them accordingly, and republishes them” (the 1640 Index would later continue the ban on his festive and satirical works, with only one exception). In 1634, the Duke of Medinaceli persuaded him to marry an older noble widow, Esperanza de Mendoza, who wished to escape scandal; this

unhappy marriage, which was more of a political alliance, would be dissolved a short 2 years later. In 1635, he was attacked viciously by his literary and political enemies in the anonymous *Tribunal de la justa venganza*, the title page of which called him “Maestro de Errores, Doctor en Desvergüenças, Licenciado en Bufonías, Bachiller en Suciedades, Cathedrático de Vizios, y Proto-Diablo entre los Hombres.”

Quevedo continued to be persecuted by his literary and political enemies throughout the rest of his life. Finally, at 11 o'clock on the night of 7 December 1639, he was arrested in the house of the Duke of Medinaceli with a letter from Olivares to the king accusing him of being “unfaithful and an enemy of the government and a slanderer of it and ultimately a confidante of France and a correspondent of the French.” He was seized with such abruptness that he did not even have time to get dressed. Quevedo was imprisoned in the convent of San Marcos in León for 4 years, during which time he suffered repeated bouts of ill health; the prison conditions were so wretched that he even had to cauterize his open sores with his own hands. Nonetheless, he continued to write such religious works as *Vida de San Pablo*. After his erstwhile enemy Olivares fell from power in 1643, he was released and allowed to return home. His health destroyed, his spirit permanently wounded, he spent a year in Madrid revising some of his manuscripts for publication. Increasingly ill, he retired to his country home for the last time. He died in a cell of the convent of Santo Domingo in Villanueva de los Infantes in 1645.

Heritage and Rupture with Tradition

Quevedo imitated the Latin classics in terms of style as well as content, sometimes engaging in serious *mimesis* and other times using the classical texts as points for parodic departure. He knew and valued the Latin Golden Age authors: Ovid's mannerism appealed to his stylistic taste, and the elegists such as Tibullus and Propertius provided material for his love poetry. Even the sober Horace makes an occasional intertextual appearance in Quevedo's works. For example, his “Sermón estoico de censura moral” is composed on the

model of Horace's satirical *sermões*, while his “Epístola satírica y censoria,” written in tercets, is likewise written after the fashion of the Horatian *Epistulae*. Virgil, too, is represented in his humanistic *imitatio*, as the Dido story reappears in Quevedo's “Imitación de Virgilio.” But while he seems to have admired Virgil's poetry as a source for linguistic purity, mythological material, and the Stoic thought he believed was there, he also parodied this most serious of poets.

Ideologically and stylistically, Quevedo showed a strong preference for Silver Age authors such as Tacitus, Petronius, and especially Seneca, the classical Spaniard whom he patriotically chose to see as a literary and philosophical role model. He crafted his style in the *Marco Bruto* after the Latin prose style of Seneca, Tacitus, and Lucan, with its hyperbaton, repetition, and opposition of terms. At least 70 of his shorter poems are elaborations of quotations or epigrams from Martial, Persius, or Juvenal. The *satura* form of these latter two authors was also influential for Quevedo when he wrote his longer satirical works. Quevedo's *Sueños* fall within the tradition of Seneca's *Apocolocyntosis* but also bear some resemblance to Lucian's *Dialogues*. Some themes from Seneca's tragedies and Lucan's *Pharsalia* are also evident in Quevedo's amorous poetry. Quevedo's translation of the *Letters to Lucilius* and his epitome *De los remedios de cualquier fortuna* (1638) show the depth of his direct knowledge of Seneca (or, in the latter case, pseudo-Seneca), but he also learned about Stoicism from Epictetus, whose *Enchiridion* he adapted and published in 1635.

By modeling many of his writings closely on the works of classical authors, Quevedo opted for the traditional philological approach to literary creation. In his *Sueño del infierno*, Quevedo shows himself well enough informed about the practices of contemporary scholarly method to condemn Julius Caesar Scaliger and other contemporaneous humanists to hell for sins that were fundamentally philological. Quevedo himself, however, was guilty (by modern standards) of one egregious philological “sin”: he tried so hard to reconcile pagan and Christian philosophy that he insisted, in his *Doctrina estoica*, on tracing a direct influence of the Old Testament book of

Job upon the Stoic thinkers Epictetus and Seneca. Quevedo cites these two Stoics as well as Juvenal and Persius as being compatible with Christianity. Lucan, like the other Silver Age authors whom Quevedo favored, lived after the birth of Christ and therefore had the opportunity to come into contact with Christian truth. But not all the Silver Age authors were as sympathetic to Christianity as Quevedo felt they should have been. Martial, for example, uttered many commendable sentiments “con profana boca” (“with a profane mouth”), while Tacitus is severely criticized by Quevedo for being anti-Christian at a time when he could – and in Quevedo’s eyes, should – have been sympathetic to the new religion. Quevedo stopped short in most instances of asserting that pagan writers actually converted to Christianity. But his synthesis of classical with Christian philosophy was typical of the Christian Humanism of his day.

Innovative and Original Aspects

Much has been written about Quevedo’s Neostoicism. One of the most influential factors in shaping Quevedo’s synthesis of Christianity with classical Stoic philosophy had been his youthful exchange of letters in Latin with the Flemish humanist Justus Lipsius. Quevedo’s correspondence with Lipsius had begun early, in 1604, but the effects of their relationship lasted for several decades. Quevedo’s interest in Stoic themes was probably reinforced by his banishment as well as his successive political and social disasters. As a result of his personal misfortunes, along with the Inquisitorial suspicion cast upon him by his ongoing placement on the Index, Quevedo wrote almost exclusively serious works beginning in the mid-1630s. In rapid succession came his translation of the *Introduction à la vie dévote*, his Neostoic work *La cuna y la sepultura*, his adaptation of a work attributed to Seneca, *De los remedios de cualquier fortuna* (completed in 1633; published in 1638), and his *Providencia de Dios...* (1641–1642). His Neostoic manifesto was published in 1635 as *Nombre, origen, intento,*

recomendación y descendencia de la doctrina estoica, but other moralistic works of his, such as *Virtud militante*, *La constancia y paciencia del santo Job*, and *Doctrina moral del conocimiento propio y del desengaño de las cosas ajenas*, bear strong Neostoic overtones. From the mid-1630s on, he seems to have wanted to change his image from that of a brilliant but heretical satirical writer to that of a sage and erudite humanist.

Impact and Legacy

Quevedo’s writings in almost every conceivable genre make him one of the foremost Spanish intellectuals of all time. But few of his more than 875 poems, including sonnets, Pindaric odes, *silvas*, *jácaras*, and *letrillas*, were published during his life, although many were later collected for publication by his nephew and his editor, Pedro de Aldrete Quevedo and Jusepe Antonio González de Salas. His humanistic accomplishments included translations of classical authors as well as imitations of their style and subject matter in both Spanish and Latin. An early example of his ability to imitate Seneca’s Latin is an epitaph for his friend and fellow poet, Luis Carrillo y Sotomayor. Typical of the early praise for Quevedo’s accomplishments is that of his editor González de Salas, who wrote in 1648 that “Hasta hoy no conozco poeta alguno versado más, en los que viven, de hebreos, griegos, latinos y franceses; de cuyas lenguas... tuvo buena noticia” (“Until today I do not know any poet alive who is more well-versed in Hebrew, Greek, Latin, and French; of which languages... he possessed a good knowledge”). On the basis of his translation of such authors and works as the Greek anthology, pseudo-Phocylides, Anacreon, and Plutarch’s life of Marcus Brutus, Quevedo’s contemporaries regularly praised his Greek in particular, although a discordant voice was raised by his enemy Luis de Góngora. Modern scholars have tended to agree with the latter’s assessment of Quevedo’s Greek abilities, but his scholarly procedure in other areas met or exceeded the standards of his day.

Recent work on Quevedo and philosophy has emphasized his politico-moral stance as anti-Machiavellian. There have also been efforts to qualify his Neostoic doctrine as having been influenced to some degree by the Sophists. His *Stoic Doctrine* appears in English translation in the *Moral Philosophy* volume of the Cambridge Translations of Renaissance Philosophical Texts, and he is likewise highlighted in the “Moral Philosophy” chapter of *The Cambridge History of Renaissance Philosophy*. By any measure, Quevedo is a major figure within the pantheon of Renaissance philosophers and also one of the clearest examples of the intersection of philosophy with literature. His Christian Humanism represents a unique synthesis of pagan philosophy with religious belief.

Quintilian

Born: AD 35–40, Calahorra (Spain)

Died: c. 96, Rome

C. Marsico

Ludwig Boltzmann Institute for Neo-Latin
Studies, Innsbruck, Austria

Abstract

Quintilian's *Institutio Oratoria* exerted extraordinary influence on many areas of European culture during the Renaissance, impacting a large array of topics, ranging from rhetorical precepts to pedagogy. Prominent figures of Italian and European humanism, such as Poggio Bracciolini, George of Trebizond, Lorenzo Valla, and Angelo Poliziano, examined the ancient rhetor at length, considering him to be a complementary or alternative model to Cicero. The high number of both *Institutio* editions and rhetoric manuals based on it show that Quintilian held a very dominant position within the sphere of educational teachings in Early Modern Europe.

Impact and Legacy

Quintilian's *Institutio Oratoria* exerted extraordinary influence on many areas of European culture, impacting not only the study of rhetoric but also poetics, pedagogy, morality, theater, and even the history of art (Galand et al. 2010). Known throughout the Middle Ages in a very partial text of the *Institutio Oratoria* and only scarcely mentioned in Late Antiquity, the Renaissance saw Quintilian become, instead, a reference model for pedagogues, grammarians, philologists, orators, and theorists of the arts in general, and philosophers were no exception (Johnson 1966; Winterbottom 1967; Cousin 1975; Classen 1994). Nevertheless, the history of Quintilian in the Renaissance still awaits to be written.

Petrarch came to know Quintilian at the end of 1350, albeit in a mutilated form, thanks to a gift

from Lapo Castiglionchio the Elder (the manuscript is Paris, Bibliothèque Nationale de France, lat. 7720; Accame Lanzillotta 1989). His enthusiasm for the text was so great that in subsequent years, not only did he carefully annotate this manuscript, but he also dedicated a letter to Quintilian, the *Fam.* XXIV 7, in which he defined the *Institutio* as a precious object, hoping that someone could bring it back to light in its integral form (Accame Lanzillotta 1989, 1–4). Quintilian – who Petrarch, like his contemporaries, considered to be the author of the *Declamationes Maiores* as well – despite being an extraordinary educator, cannot measure up to Cicero as an orator (Accame Lanzillotta 1989, 3).

The scholar able to return Quintilian's full text to the humanists was Poggio Bracciolini, thanks to the lucky discovery of a manuscript during his first trip to Sankt Gallen between August and September 1416 (Winterbottom 1967, 340–344, 355; Fiesoli 2013, 135–137). Very famous is the letter to Guarino Veronese with which Poggio announced this great achievement (Bracciolini 1984, II, ep. IV 5), long coveted also by Coluccio Salutati (1896, III, ep. 9, 20 and Classen 1994, 80–82).

The Poggian tradition of the *Institutio* enjoyed great prestige and extraordinary vitality throughout the fifteenth century (Winterbottom 1967, 342–343), which was not limited solely to Tuscany (Ferrari 1984; Classen 1994). Before long the work became a fundamental text for any humanist engaged in an in-depth reflection on education. Numerous pedagogical treatises written between the fifteenth and sixteenth centuries (like those of Maffeo Vegio, Matteo Palmieri, Enea Silvio Piccolomini and, later, of Erasmus of Rotterdam and Juan Louis Vives, both Quintilian experts: Colson 1973, LXX–LXXII) are in fact imbued with Quintilian analyses, especially extracts from the first book of the *Institutio* (Classen 1994, 93–94; Nassichuck 2010). Similarly, many humanists (Erasmus, Fonzio, Vida, Rabelais, Ronsard, among others) drew from Quintilian ideas for their reflections on rhetorical theory and practice, recovering from the *Institutio* notions such as *copia*, inspiration, improvisation, and imitation (Galand 2010). Moreover,

Quintilian soon became part of the scholastic canon: Battista Guarini, for example, recommended that his students use not only the *Rhetorica ad Herennium* and Cicero's texts to learn rhetoric but also those of Quintilian, "who is extremely good at this subject" (Guarini 2002, 11). In this respect, the education program developed some decades later by the Jesuits was perfectly in line with the humanistic one: Quintilian and his project for the formation of men based on rhetoric became a landmark in the educational system of the Society of Jesus (Baffetti 2010).

The renewed reading of Quintilian made possible by Poggio's discovery did not arouse unanimous reactions: in 1433–1434 George of Trebizond in his *Rhetoricorum libri quinque* criticized the ancient rhetor and even threatened to supplant him (Monfasani 1976, 262, 267–268). This is just one of the examples of the strain of anti-Quintilianism documentable in Renaissance Italy (Monfasani 1992). Almost a century later, in 1549, Peter Ramus, in his attempt to refute foundational texts in philosophy and rhetoric (Aristotle as well as Cicero), published his *Rhetoricae Distinctiones in Quintilianum*, openly challenging Quintilian (Newlands and Murphy 1986).

Quite different was Lorenzo Valla's reaction, who went so far as to overturn Petrarch's judgment. Despite the prevailing devotion to Cicero of the time, in the juvenile *Comparatio Quintiliani Tullii*que, he attributed the palm of victory to Quintilian (referring, however, to the author of the *Declamationes*) in a clash with Cicero played out through orations: the declamation of Ps-Quintilian's *Gladiator* against Cicero's *Pro Ligario* (Pagliaroli 2006). The relationship between the humanist and the *Institutio* – which Valla declares to know "almost by heart" in *Antidotum in Facium* I 7, 2 (Valla 1981), and of which he transcribes entire chapters in his *Repastinatio Dialectice et Philosophie* – cannot be circumscribed, in fact, to just one sphere: Quintilian is foundational to Valla's conception of the language and involves the totality of his intellectual analyses (Camporeale 1972; Regoliosi 2010). In particular, the entire cultural undertaking of the *Elegantie* is formed by Quintilian's ideas (defined, alongside Cicero,

"light and gem not only of all wisdom, but also of Latin eloquence" in *Elegantie* I 17), as well as Valla's reformation of Aristotelian scholastic philosophy in his *Repastinatio* (Nauta 2009; Regoliosi 2010). The "re-plowing" of Aristotelian scholastic metaphysics, natural philosophy, and logic is based primarily on a review of the language, which derives from the Quintilian concept of *consuetudo* (Camporeale 1972). The resulting reduction of the Aristotelian categories made by Valla also originates from Quintilian's principle that dialectic must be "a very short and easy subject" (as he affirms in the second proem of the *Repastinatio*), depending on rhetoric which is, in turn, the structure of all knowledge (Regoliosi 2010). Even the demonstration of the falsehood of the *Constitutum Constantini* is based on rhetorical procedures extracted from Quintilian, in particular from *Inst.* V 5 (De Caprio 1978).

Valla's careful reading of the *Institutio* can be followed in his manuscript, which is still extant (Paris, Bibliothèque Nationale de France, lat. 7723; a second manuscript belonging to him is now lost), in which the humanist prepared a rich historical and erudite commentary, eminently legal (Valla 1996; Fernández López 1999). The manuscript is a witness of singular importance in the Quintilian tradition because of the many good readings that it preserves. Since many of them are directly written by the copyist's hand, it was assumed that they stem from an initial critical work on the text made by Valla (1996, XXI–XXIII).

The echo of the debate on Quintilian set into motion by Valla's theses (harshly criticized by Poggio, among others) reached Florence and the other great master of humanistic philology, Angelo Poliziano, who made the *Institutio Oratoria* the subject of his public lectures in the 1480–1481 so inaugurating his academic career in the Florentine Studio in the name of Statius and Quintilian. In his *Oratio super Fabio Quintiliano et Statii Sylvis*, while affirming not wanting to put Quintilian before Cicero, he considers "his *Institutiones oratoriae* fuller and richer than Cicero's rhetorical works" (Poliziano 1952, 877) and, for their ordered structure, better suited for teaching and learning rhetoric (Daneloni 2001,

12–13). There are no authentic testimonies regarding Ambrogini's lessons on Quintilian; his extensive work on the text of the *Institutio* is known instead thanks to the rich annotations recorded on his copy of the incunable published in Milan in 1476 by Antonio Zarotto (Florence, Biblioteca Nazionale Centrale, Banco Rari 379). The notes, which perhaps constituted the preparatory material for the course, are wide ranging in variety, spanning from simple annotations made to facilitate the reading to textual corrections (including excellent conjectures) and comments indicating a high level of scholarship (Daneloni 2001).

The growing interest in the second half of the fifteenth century in Quintilian's text is demonstrated by the early prints of the work: the *editio princeps* of the *Institutio* was published in Rome on August 3, 1470, by the printer Filippo da Lignamine and edited by Giovanni Antonio Campano. Many others followed, including, in the same year, a second print by Konrad Sweynheim and Arnold Pannartz and a third by Nicolas Jenson. The first two annotated editions were published in Venice (Cousin 1975, 171–172; Perosa 1981). The first one, published in 1493, was equipped with an extensive commentary attributed to Raffaele Regio and to Bartolomeo Merula. Regio, who dealt with Quintilian in his *Annotationes* and in the *Ducenta problemata in totidem Institutionis oratoriae Quintiliani depravationes*, was able to use some of the major experiences that humanistic philology had hitherto expressed (Winterbottom 1999; Perosa 1981, 286–287); it is likely that he obtained Quintilian materials relating to Poliziano's course of 1480–1481 (Daneloni 2001, 181–183). The second commented edition appeared in 1494 and included the commentaries prepared by Valla, Pomponio Leto, and Sulpizio from Veroli (Perosa 1981). The press and the work of great intellectual publishers like Josse Bade, who used the earlier works and especially Valla's comment, transformed Quintilian's masterwork into a European best seller, despite Cicero continuing to occupy a leading position in rhetorical teachings: between 1470 and 1539, the *Institutio*

became, in fact, readily accessible through more than 40 editions (Cousin 1975, 171–174; Classen 1994, 97–98).

Quirini, Lauro

Born: Venice or Candia, 1420

Died: Candia, c. 1480

Annalisa Ceron

Department of Philosophy, University of Milan, Milan, Italy

Abstract

Lauro Quirini was a Venetian humanist, educated at the University of Padua, who took part in disputations with Leonardo Bruni, Lorenzo Valla, and Poggio Bracciolini. He made a key contribution to one of the most important debates of fifteenth-century humanism by using Aristotelian arguments against Bracciolini to defend the claim that nobility was based on descent. Around 1450 he wrote a political treatise in which he combined Aristotle's analysis of the best form of government with Cicero's idea of the republic. He may therefore be considered one of the leading figures of the Italian Renaissance.

Biography

Quirini was born into a patrician family in 1420 either in Venice or Candia, the first city of the administrative district of Crete then under the control of the Republic of Venice. In 1440 he graduated in liberal arts from the University of Padua, one of the main centers of Renaissance Aristotelianism. He went on to spend a year in Florence hosted by Cardinal Bessarion. As Vespasiano da Bisticci noted in his biography of

Quirini, during his stay in Florence, he met Leonardo Bruni and other leading humanists of the city. Despite becoming well established in Florentine society, in 1442 he returned to Padua to study civil and canon law.

Between 1443 and 1448, Quirini gained a reputation as an orator, among his addresses being the funeral eulogy of a famous mercenary known as Gattamelata, and in 1449 he gave public lessons in the city of Venice on Aristotelian ethics. Two years later, he became a lecturer in rhetoric and moral philosophy at the University of Padua. However, in 1452 he abandoned his academic career and moved to Candia, where his family had extensive business interests, and there he devoted himself to such profitable activities as the trade in alum, wine, and textiles.

Quirini remained on the island of Crete from 1452 until his death in around 1480. Although a merchant in the second part of his life, he never gave up his humanistic studies and served for a number of years as an agent to Cardinal Bessarion, procuring and transmitting important Greek manuscripts.

While living in Candia, Quirini also wrote a number of historical letters on the fall of Constantinople and on Turkish expansionism in the Aegean Sea. Two of his letters are noteworthy insofar as they were addressed to Pope Nicholas V (1454) and Pope Pius II (1464) and insisted on the need for a crusade (Quirini 2014, pp. 104–108). However, the letters of his earlier years are far more interesting since he corresponded with such humanists as Leonardo Bruni, Lorenzo Valla, and Poggio Bracciolini, disagreeing on certain theoretical issues. He also corresponded with the noblewoman Isotta Nogarola, to whom he gave advice on refining her knowledge of humanistic studies (Quirini 2004, pp. 107–113).

Heritage and Rupture with the Tradition

All of Quirini's works were written before moving to Candia and were essentially based on Aristotelian arguments. His debt to Aristotle was already evident in his first work of 1440, the Latin dialogue *De politia*, in which he

imagined himself discussing moral and political questions with the Greek philosopher. Like other humanists, he was attempting to recover the authentic meaning of Aristotle's philosophy. Moreover, in line with the early, pre-Ficinian and pedagogical readings of Platonism, he attempted to show that Aristotle's teachings were not at variance with the ideas of Plato. As recently remarked (Martin 2014, pp. 50–53), the letter that he wrote to the captain of Padua, Andrea Morosini, in 1440 helps to clarify his approach to Aristotelianism. In it he refused to express absolute faith in Aristotle's authority, drawing a distinction between orthodox Christian belief and the views of ancient philosophies. Hence he argued that Aristotle's thought should be analyzed without reference to theological arguments, and thus it is unsurprising that he has been considered a Renaissance Averroist (Marwan 2006, pp. 700–714).

During his time in Florence, Quirini's interest in Aristotelianism did not wane, even though he also wrote more humanistic works: a lost commentary on the poem composed by Cyriacus of Ancona for the poetry competition organized by Leon Battista Alberti (the first "certame coronario") and two moral dialogues in the style of Lucian, the *De pace Italiae* and the *Dialogus in gymnasiis Florentinis*, the latter being a compendium of Aristotle's moral philosophy. He also tackled Aristotle's moral philosophy in his epistolary controversy with Leonardo Bruni, circa 1441. Bruni's replies to Quirini's lost letters reveal that he had brought into question the traditional construal of Aristotle's concept of virtue, maintaining that temperance, justice, and other virtues should be considered extremes rather than means between two extremes (Griffiths et al. 1987, pp. 298–300). This view recalls the critique of Aristotle's account of virtue developed by Lorenzo Valla in the *De voluptate ac de vero bono* (1432) and later in the *De vero falsoque bono* (1441). Yet one should bear in mind that around 1445 Quirini wrote several polemical letters to Valla, accusing him of writing in opposition to Aristotle. Moreover, in the *De sacerdotio Christi*, the Latin translation of a Greek document of the *Suda Lexicon* that Quirini dedicated to Pope Nicholas V in 1447, he defended the legitimacy of

the *Donation of Constantine* and made critical allusions to Valla's *Declamatio*.

However, the dispute between Quirini and Poggio Bracciolini is of far greater significance than any other. It was Bracciolini's *De nobilitate* (1440) that became the main polemical target of three works in which Quirini sought to define the concept of nobility. The first of these was a letter written in 1446 to Pietro Tomasi by Quirini and two of his friends, Francesco Contarini and Niccolò Barbo. The second was the *De nobilitate contra Poggium Florentinum*, a philosophical treatise on nobility that Quirini finished around 1449. The third work, the *De nobilitate responsio, quid iuris*, was a legal treatise, written about 1450, in which he addressed the issue of nobility in juridical terms. About 1450 Quirini also finished his last work, the *De republica*, a political treatise in which he discussed Aristotle's analysis of the ideal form of government. The three works on nobility and the *De republica* advanced an original, free interpretation of Aristotelian theses and were without doubt the most innovative and far reaching of Quirini's works, which is probably why they were not left in manuscript form but were published together in the second half of the twentieth century (Quirini 1977).

Innovative and Original Aspects

Quirini's role in the fifteenth-century dispute over nobility has been investigated in considerable depth (Kristeller 1985, pp. 321–339; Rabil 1991, pp. 143–181; Finzi 2010). As is well known, Bracciolini's *De nobilitate* initiated a debate on the issue in which many humanists took part. While Florentines like Carlo Marsuppini and Cristoforo Landino and also Bartolomeo Platina agreed with Poggio that nobility consisted in moral and intellectual excellence and thus was to be found only in virtue, Quirini and other non-Florentines, such as Leonardo from Chio and Tristano Caracciolo, maintained that it depended on descent rather than virtue and was inherited.

At stake in the dispute was a new view of political aristocracy, according to which men should have access to public office on the basis

of their personal qualities, irrespective of their social status. Bracciolini and his followers, it may be said, were trying to demonstrate that men of low birth could aspire to government office, if they were virtuous and had sufficient learning. To support this thesis, Bracciolini castigated the avidity and rivalry of noblemen who had risen to power by virtue of their lineage in such cities as Genoa, Naples, and Venice. In his letter to Tomasi, Quirini described the impact that Bracciolini's *De nobilitate* had had on its readership more clearly than other humanists by giving voice to Venetian, Genoese, Neapolitan, and even Greek merchants who had denounced Bracciolini's ideas on nobility while conducting their business near the Rialto Bridge.

Quirini's *De nobilitate contra Poggium Florentinum* got to the heart of the matter. The author did not deny that nobility could be based on virtue and, indeed, tried to show that virtue depended on nature. The subordination of virtue to nature was possible because he understood the latter in Aristotelian terms and thus consistently used the word to denote inclinations and dispositions that affect men from birth. It is therefore no surprise that he maintained that virtue could evolve by nature only in the most eminent men.

Like Aristotle, Quirini did not believe in natural equality among men and claimed that the distinction between nobles and common men was grounded on natural hierarchies of power that ordered the whole universe. Nobility was thus described as a natural phenomenon, but at the same time the questions it raised were considered in essentially political terms. According to Quirini, in fact, men were to be considered nobles if they were born to govern themselves and the political community. He was stretching Aristotle's thesis on citizenship, and when moving from Aristotle's distinction between citizens and other inhabitants of the city, he did so in order to claim that nobility was the only criterion according to which men should be considered worthy of public office. In this way he offered a philosophical justification for the role of nobility in the Republic of Venice, where political participation was traditionally limited to a finite body of patrician families. But to defend the political prerogatives of his class, Quirini also quoted the *Lex Cornelia* and

other ancient Roman laws that forbade marriages between patricians and plebeians.

The fact that Quirini's rejection of Bracciolini's ideas was a defense of Venetian institutions becomes evident in the passages where he challenged Bracciolini's description of Venetian aristocracy as a faction and emphasized that the Republic of Venice was the only city that had never known internal conflicts. However, unlike Pier Paolo Vergerio (*De republica veneta*, c. 1412) and other fifteenth-century humanists who created the "myth of Venice" (Robey and Law 1975), he refrained from disclosing that Venice was free from factions because it had a form of mixed government that combined the monarchic power of the Doge, the aristocratic power of the Senate, and the democratic power of the Great Council. Moreover, unlike Leonardo of Chio, he did not consider Venice superior to Florence: in accordance with the new foreign policy pursued by Doge Francesco Foscari, Quirini maintained that both Venice and Florence were heirs to the greatness of the Roman Republic (King 1986, pp. 118–131).

Bracciolini's dialogue is also mentioned in the legal treatise of 1450, although in that work Quirini wondered whether a man could legitimize the son of a fellow noble citizen without breaking the law of the Emperor. To answer this question in the negative, he touched on the distinction between nobility by virtue and nobility by birth, merging Aristotle's theses and legal arguments. By contrast, in his *De republica* Aristotle's theses were combined with Ciceronian arguments.

Quirini's political treatise aimed to demonstrate which was the best form of government. While humanists such as Giovanni Pontano (*De principe*, c. 1465), Bartolomeo Platina (*De principe*, 1470; *De optimo cive*, 1474), and Francesco Patrizi of Siena (*De rei publicae institutione* 1465–1471; *De regno et regis institutione*, 1481–1484) focused on the virtues needed to be a perfect prince or perfect citizen (Skinner 2002), Quirini directed his attention at political constitutions and analyzed them in Aristotelian terms. As he admitted in the dedicatory letter to Doge Francesco Foscari, the *De republica* was conceived as a digest of Aristotle's *Politics* but ended up being a very different work, the chief

disparity being his attempt to fit Cicero's arguments into an Aristotelian framework.

Impact and Legacy

Like the treatise on nobility, Quirini's work on the best form of government offered an original, free reading of Aristotelian moral and political arguments (Lines 2002). As in Aristotle's *Politics*, in Quirini's *De republica*, the analysis of correct and deviant forms of government preceded a section on education clearly influenced by Pier Paolo Vergerio's pedagogical treatise on the importance of humanistic studies (*De ingenuis moribus et liberalibus studiis*, c. 1402) and was followed by an explanation of human sociability in which his debt to Cicero was unmistakable. To explain why men are by nature political animals, Quirini in fact drew on Cicero's idea of social ties that join all men by nature and also referred to Cicero's *On Duties*, *On the Commonwealth*, and *On the Laws*. On the basis of Ciceronian arguments that would resurface in Pontano's and Platina's *De principe*, he asserted that the prince should be considered as the guardian of the law. Unlike Aristotle, he criticized hereditary monarchies, which he viewed as naturally destined to decline, and praised elective monarchies, in which only the noblest and most virtuous men could become kings. He followed Cicero's theses rather than Aristotle's ones even when describing the slaying of a tyrant as an honest act. Furthermore, unlike other humanists, he used the Latin term *respublica* to denote not all political constitutions, but a specific form of government: as recently noted (Hankins 2010) by *respublica*, Quirini meant polity, the form of government by the many which Aristotle considered to be the best and which he contrasted to democracy.

In Aristotle's *Politics*, polity was the best form of government since its constitution established that public offices would be assigned partly by lot and partly by election and declared the ruling class to be the "middle" group of citizens—that is, a moderately wealthy class between the rich (the ruling class of the oligarchy) and the poor (the ruling class of democracy). By contrast, Quirini's ideal form of government was essentially an aristocratic republic in which noblemen ruled by turn,

and nobility was the only criterion used to select those worthy of public office.

As in the *De nobilitate*, in *De republica* nobility was a question of birthright rather than character, but the distance between the noble and common man was wider since Quirini held that people without rank or title should only ratify decisions aimed at ensuring that liberty did not turn into anarchy and that political unity did not give way to discord. Moreover, the distinction between noblemen and common men conflated into that between patricians and the plebeians because Quirini used the Roman Republic as an example alongside Aristotle's polity. There is no doubt that his model of the Roman Republic was a Ciceronian one since he referred to Cicero's definition of the republic as something belonging to a people (*res publica, res populi*), pointing out that not all human assemblies could be defined as a people and that the term "the people" was applicable only to a body of persons united in agreement over rights (Cic. *De rep.* I, 39).

Although Quirini made no direct reference to the Republic of Venice, it is probable that he turned to Cicero's notion of republic because it appeared to match more closely the political institutions of Venice than Aristotle's polity (Cappelli 2010). Thus in both his political treatise and his treatise on nobility, he interpreted Aristotle's ideas in a highly original way, with one eye on the Roman Republic and the other on that of Venice. This way of reading Aristotle constitutes the principal legacy left to us by Quirini.

Abstract

François Rabelais is a major French figure of the Renaissance. Active in his time as a physician, humanist, monk, and scholar of Greek, Rabelais was well-known in humanist circles, but it is his reputation as a writer of novels that has sustained his renown over the centuries. The protagonists of his most famous novels are two giants, Gargantua and Pantagruel; their fantastic and grotesque adventures, along with Rabelais' characteristic coarse and lewd humor and satirical tone, have become the distinctive features of his work. However, it was not always plain sailing for Rabelais, as his works were banned and systematically condemned by church authorities. His writings

have multiple meanings, and the reader is constantly urged to go beyond the text's surface meaning to discover the other levels of interpretation. Rabelais' novels and their success are a testament to his literary prowess, and his influence on literature has been acknowledged by critics who recognize him as one of the creators of the modern European novel. Today, he is considered to be one of the greatest writers of all time.

Biography

François Rabelais was born in La Devinière, near Chinon, in either 1483 or 1494. Little is known about his family; he was one of three sons of a landowner who was a lawyer by profession. Around 1520, Rabelais entered a Franciscan monastery in Fontenay-le-Comte, which was the busy capital city of the region of Lower Poitou at the time. There, he met Pierre Amy, who would become one of his closest friends, as well as the famous jurists André Tiraqueau and Amaury Bouchard. Like them, Rabelais was interested in topics such as natural history, medicine, religion, and the social organization of marriage. He read Latin and Greek and, following humanist philosophical methods, turned to ancient texts to enhance his knowledge. He first came to attention as a correspondent of Guillaume Budé and soon after was recognized as an eminent specialist of the Greek language. In 1524, he left the

Franciscan monastery where Greek books had been forbidden and fled to his friend Geoffroy d'Estissac, abbot of Maillezais, where he found shelter among the Benedictine monks. Geoffroy d'Estissac had an enlightened mind and was open to new ideas. Rabelais became his secretary and traveled with him throughout the region of Poitou, discussing issues for debate with other scholars. In his narrative works, traces of place names from both this region and the area around his birthplace, near Chinon, can be found.

In 1530 and 1531, Rabelais studied medicine at the famous university of Montpellier. There, he met Guillaume Rondelet, the naturalist and physician who would later find renown for his treatise on fish (*Histoire naturelle des poissons*, 1558). In 1532, Rabelais worked as a physician at the Hôtel-Dieu public hospital in Lyon. At that time, the town was a flourishing center of commerce, trading mainly with Italy and Switzerland. Alongside his job in the hospital, he met publishers and carried out several important translations: Greek medical treatises (Hippocrates' *Aphorisms*, *Ars parva* by Galen, 1532) and Italian texts written in Latin (1532, *Epistolarum medicinalium* by Manardi and 1534, *Topographia antiquae Romae* by Marliani). In 1532, he also published his first great novel *Pantagruel* (*Pantagruel, roi des Dipsodes, avec ses faits et prouesses épouvantables*); this first part was followed in 1534–1535 by the first edition of *Gargantua* (*La vie très horrifique du grand Gargantua, père de Pantagruel*), the story of Pantagruel's father; both books were revised in 1542. The narratives were published under the anagrammed pseudonym Alcofribas Nasier, who served as the story's narrator and was referred to on the title page as an "*abstracteur de quintessence*," a metaphorical designation of the author's function. Clearly, this pseudonym acted as a protective mask that not only shielded Rabelais from personal attacks but also came to suggest that the role of the author was not so different from that of an alchemist: to abstract quintessential matter. It should be noted here that this period of his life was marked by two directions in his writing: he published both scientific books and fantasy novels (the former with publisher Sebastien Gryphe and the latter with Claude Nourry and François Juste).

Between 1534 and 1536, Rabelais had the opportunity to travel to Rome on three occasions, each time accompanying the Archbishop Jean du Bellay, who served as the king of France's ambassador to the Pope. As a confirmed humanist, Rabelais took advantage of his travels to meet Italian scholars interested in painting, art, architecture, antiques, ancient books, and modern innovations. He explored the wonders of Rome and Florence; in Rome, he made a supplication to the Pope to be forgiven for his apostasy. He completed his studies in Montpellier in 1537 as a Doctor of Medicine where he practiced anatomy and taught *Pronostics* by Hippocrates. In 1538, Guillaume du Bellay, brother of Jean du Bellay, became the governor of Piedmont, and his political strategies in Italy inspired Rabelais to publish *Strategemata* in 1539. This last book has unfortunately been lost to time.

In 1541, he wrote an almanac under his own name, as well as a fake prognostication for the year 1541 under the pseudonym of Seraphino Calbarsy. In 1532, he had already published *A Pantagruéline Prognostication for the Year 1533* under his own name, "François Rabelais, doctor of medicine and professor of astrology." These real or fake prognostications were repeated every year until 1544. In 1542, he published a second edition of his first two novels, *Gargantua* and *Pantagruel*. The Faculty of Theology at the Sorbonne placed both works on its Index of Prohibited Books. While the books continued to be published under a pseudonym, the author still made many significant corrections and additions in order to sound less offensive.

In 1543, Rabelais suffered a great loss with the death of two of his closest friends and protectors: Guillaume du Bellay, whose death was evoked in two different episodes of the *Third* and the *Fourth Books*, and Geoffroy d'Estissac.

In Paris, in 1546, Chrétien Wechel published Rabelais' *Third Book* (*Tiers Livre des faits et dits héroïques du bon Pantagruel*) under the author's real name, "M. François Rabelais, Doctor of Medicine." Soon after, the Faculty of Theology banned this book as well, and Rabelais left for Metz for his own safety. He likely went to Rome as Jean du Bellay's personal physician.

A first version of the *Fourth Book* (*Quart Livre*) was published in Lyon in 1548, with a final and complete edition published in Paris in 1552. Between these two dates, Jean Calvin, in his book *Scandals* (*Des Scandales*), protested against Rabelais' immorality. In the same period, Rabelais was appointed priest at Meudon, near Paris. At this time, his first three books were still banned.

Rabelais died in 1553. The *Fifth Book* (*Cinquième Livre*), first published in a short version under the title of *L'isle sonante* (1562), was published in 1564 and presumably was not entirely authentic. In 1564, François Desprez published *Les songes drolatiques de Pantagruel*, inspired by the works of Rabelais.

Heritage and Breaking with Tradition

At the Crossroads of Different Writing Traditions

The stories and main characters of the first two novels, *Pantagruel* and *Gargantua*, are inspired by different traditions. First, the tradition of the "great chronicles" (*Grandes et inestimables Chroniques de l'enorme geant Gargantua*), which is quoted in *Pantagruel's* Prologue: "those who liked the Great Chronicles would appreciate the new book," says the author. In ancient books written in epic medieval prose, heroes, who were also giants, had to overcome difficult ordeals at King Arthur's Court. The book of these "chronicles" was a real success. Rabelais then dedicated his own book to the passionate readers of such stories, claiming to belong to this tradition and to continue it, which he did, or at least appeared to.

In addition to the literary tradition, Rabelais drew a great deal on French folklore, in which Gargantua was already a well-known character, as was the fairy Melusine. Rabelais was fond of borrowing such characters and sometimes transformed them in his own way. Pantagruel, for example, is a little devil at first. In popular legends and in farces of fifteenth-century mysteries, he plays tricks on people by sprinkling salt in their throats while they sleep so that they wake up terribly thirsty. Rabelais kept these notions in his novel, but the little man becomes a giant endowed

with humanist and Christian principles that compel him to do good deeds.

Furthermore, being deeply familiar with antiquity, Rabelais' writings echo the comic tradition of the burlesque of Lucian of Samosata. This inspiration is very important, as it guides the narrative in the direction of a false yet apparently true story in which fantasy is told as perfect truth. This launches a sort of game with the reader who is challenged to believe the unbelievable, not only with settings on imaginary islands or in fantastic places but also with strange allegorical creatures and many bizarre encounters with different marvels.

Finally, bearing in mind that Rabelais was also a physician and keenly aware of the latest innovations and discoveries in natural sciences, the strong presence of science within his fiction cannot be overlooked. Epic battles, for instance, are written with the vocabulary of anatomic dissections, and imaginary plants, such as the Pantagruelion, are described in the style of a botanical treatise.

The Echo of Humanist Ideas

Rabelais' fiction not only strives to entertain but also aims to convey ideas. Rabelais was particularly fond of Erasmus' idea of the "*dignitas hominis*" and of the major role that formal education plays in an individual's personal education. Humanist or Erasmian principles are at stake in the childhood episode of the giant Gargantua, in which the young hero has to change teachers in order to experience new education. At first, he had to learn all kinds of idle knowledge by rote, understanding nothing, and taking no advantage of it to mature and gain experience. Even his innate qualities were repressed or stifled under his instructors. Once placed in the care of humanist teachers, he learned at last to read, understand, and comment on his readings. Acquiring such a fine education, he was finally able to come into his own and fulfill his potential: to show his true mind and to improve and achieve his real nature and capacity of being a prince. In *Pantagruel* (Chapter 8), a letter from Gargantua to Pantagruel betrays similar priorities – "knowledge without conscience is but the ruin of the soul" ("*science sans conscience*

n'est que ruine de l'âme") – and sums up the requirements for a complete humanist education. The student will focus on learning languages, both ancient tongues and modern vernaculars. This ideal education is then illustrated in the next chapter by Pantagruel's encounter with Panurge, a stranger who speaks 13 different languages fluently. It is only evident much later on when Panurge speaks in French that, in fact, this language is his mother tongue.

Education is not the only humanist idea Rabelais introduces in his narrative works. He also discusses the need for an appropriate diet, essential for good health, and stresses the importance of peace-keeping between different states, especially if they are neighboring ones. When Erasmus wrote about the rules of good government, he underlined the horrors of war and stressed the need for peace. Rabelais, in turn, told the story of the Picrocholine Wars to demonstrate the monstrosity and injustice of imperialism.

Rabelais' novels can rightfully be considered a mirror of humanist thought. This "serious" interpretation ought not to be considered antagonistic to the "joyful" or "humorous" one: each is complementary, since the stories always contain both aspects simultaneously.

Inside the Novels

The five-book cycle forms an ensemble, and the same heroes reappear in different adventures.

The first published book, *Pantagruel*, tells the story of Pantagruel's miraculous birth, youth, and life. Although the novel follows the medieval tradition of epic chronicles, the hero is now presented as a perfect humanist and Christian character, a very wise person – yet this does not prevent him from getting into trouble. Discovering Paris with his companions, Pantagruel meets several strange characters: a student from the region of Limousin, the perfect caricature of a stupid pedant, and Panurge, a fascinating trickster who does not care about morality and likes to show off his skills as a cheater and a laughing prankster. The war against the Dipsodians shows the interest of wit and tricks; interactions with ladies underline the fact that the medieval sense of "courtly love" had become old-fashioned. This

book contains the famous letter from Pantagruel's father about an ideal education (including the aforementioned "knowledge without conscience" quotation) and a curious episode at the end in which the gigantic hero swallows his own narrator, Alcofribas, who finds a "new world" in the throat of the hero where peasants live peacefully, convinced that they are living in the "ancient world." This episode is very revealing about the idea of the relativity of our conceptions of the world.

Gargantua, the second book, is structured along a similar biographical pattern. This time, the narrative focuses on Pantagruel's father, Gargantua, who tells the story of his extraordinary birth and curious adventures during his youth and into adulthood. The novel is meant to mislead the reader or at least toy with their expectations. After a miraculous birth through his mother's left ear, the young hero apparently spends his childhood like all of the other children in his country: eating and drinking, sleeping, and playing. But his games are quite special, for example, he invents an ingenious "*torchecul*" (arsewipe), plays tricks on his father's friends, steals the bells from the Notre-Dame Cathedral in Paris, and takes revenge on Parisians by making his horse urinate so abundantly that it drowns part of the city. The first third of the book includes amusing episodes linked to Gargantua's gigantic body. Later on, a war is sparked from a misunderstanding. New characters come into play like Picrochole (literally, the "bilious"), the imperialist king of the neighborhood who cannot help getting angry and fighting. His officers are all ridiculous, whether for their names or their actions. Another important character of this war is Friar Jean, a monk who defends his abbey against enemy pillaging before joining Gargantua's company, where he takes part in both the fights and the feasts, always playing a very active, prominent, and stimulating role. At the end of the book, Picrochole is defeated, and Gargantua awards Friar Jean the opportunity to found an abbey according to the monk's own ideas. The Abbey of Thelema is a magnificent place, looking much more like the castles of the Loire than a cloistered monastery. All the rules and habits of a monastery are reversed: men and women can

live together in perfect harmony, and the main principle is to “Do what thou wilt” (“*fais ce que voudras*”). This episode is considered as a utopian attempt to describe an ideal society.

The *Third Book* begins with a very different purpose. Panurge is eager to get married, but not before making sure that his future wife will be faithful to him. He first asks his friends for advice, but remains uncertain and so then refers to different authorities, including a prophet, a philosopher, a physician, a man of law, and finally... a fool! The story proceeds from one piece of advice to the next, from one kind of knowledge to another, most of the time uttered in the most obscure specialist language that requires an explanation. Pantagruel always offers his interpretation of the answer, while Panurge, providing his own understanding, always contradicts him. It becomes apparent that the meaning of words depends on the listener and that the book demonstrates a kind of hermeneutic crisis: confronted with the universal ambiguity of language, the reader never knows where to stop interpreting as any interpretation invalidates a previous one, and none of them are especially convincing. Panurge’s quest for a final answer remains the central plot in the *Fourth Book*. He has convinced his friend Pantagruel to depart on a voyage to find “the bottle’s word” (“*le mot de la bouteille*”), which he thinks will be decisive in his search for answers. The narrative thus continues at sea, traveling from one land to another. While each of the islands visited by the protagonists is surprising and purely fictional, nonetheless, their inhabitants represent some social stereotypes of Rabelais’ time. Travel is thus to be understood in the allegorical sense of passing from one satire to another. Panurge’s sheep is one of the book’s most famous episodes. The trickster wants to take revenge on a stupid merchant selling sheep at an exorbitant price, but when the merchant does eventually sell him an overpriced sheep, Panurge throws it into the sea; the rest of the flock follow it eventually all the sheep drown. Having punished the pretentious merchant, Panurge laughs heartily.

As the “bottle’s word” has still not been found at the end of the *Fourth Book*, the story of the *Fifth Book* – whose attribution to Rabelais is called into question – tells the concluding episodes of the

quest. Once again, the heroes stumble into strange encounters in extraordinary or frightening fictional places. Finally, they meet the female priest Bacbuc, who reveals the long-awaited word, but only at the end of a complex ceremony. It comes in the form of a poetic calligram, written in the shape of a bottle. The characters are then invited to drink from a marvelous fountain, the “water” of which tastes like wine, but only like the wine the drinker thinks of while drinking; the priest’s magic formula is “Now, imagine and drink.” The magic water also gives the power to speak in verse. The final lesson of the book seems to rest squarely within the power of imagination, as the famous word they were looking for is simply “trinch,” which can mean the imperative “drink” in German or simply the sound of a breaking bottle. The interpretation that an individual gives to strange messages cannot be taken for granted, i.e., it is subjective, and in this case, it is called into question: is “trinch” a real message to be deciphered (and what does it mean in relation to the rest of the story?) or is it, literally, merely the sound of a bottle breaking by accident?

Innovative and Original Aspects

The summaries of the books show how Rabelais profoundly changed French narrative prose in the early sixteenth century. His stories are meant to be amusing, but they are also so much more. The dialogue, instead of opening relationships between the characters and revealing aspects that could help to advance the plot, leads to misunderstanding and perplexity, slowing down any advancement in this respect. A commentary would be necessary for a single understanding, but nothing conclusive or convincing is provided, so the reader is typically confronted by double meanings. With different interpretations, the reader has to choose for himself as the text only exposes a hermeneutic dilemma, without one unique or satisfying solution.

For Rabelais, paradox is a guideline to fiction. Within the story, both serious and comical tones are combined, contradictory interpretations presented, and medieval traditions merged with the

latest humanist ideas. Every book both begins and ends with several questions, but never offers an explicit conclusion. When reading such books, it should be born in mind that there is never one single meaning. Such hermeneutic potential shows that Rabelais' fiction addresses the problems and issues of his time, such as the investigation into the power of words and the tragedy of misunderstanding (i.e., the censorship of much of Rabelais' work), yet without denying the epic or adventurous settings that make it fiction. Therein lies a kind of explosive confrontation between past traditions and a new form of fiction that reinvents itself through provocation.

The Paradoxical Image of the Author

The author, who included encyclopedic content within a fantasy story, did not stand before his reader as an erudite scholar. On the contrary, he preferred to present ridiculous aspects of himself, especially in the Prologues. He claims that drinking, eating, and joking with merry companions are what can help him achieve perfection in writing. His main purpose, as he says in *Gargantua's* Prologue, is to fill every reader with joy and laughter, "Because to laugh is proper to man" (*"parce que rire est le propre de l'homme"*).

The tendency to portray himself as a laughing figure culminates in the *Third Book*, in which he adopts a specific persona following the example of Diogenes, whose apparent vanity and idleness were condemned by his contemporaries. What he does, however apparently useless and risible, is paradoxically regarded as essential, and Rabelais assumed the identity of a grinning figure to prove this. In the *Fourth Book*, in an epistle to his protector Odet de Châtillon, Rabelais explains how he had decided to quit writing because he could no longer endure so many attacks. He was close to retiring from literature when he found reassurance that his paradoxical posture was the device that enabled him to create his works. In fact, in all of his Prologues, Rabelais seems not to care about good manners and prejudices, addressing his reader brusquely, sometimes even crudely. This peculiar writing style can be explained by two different hypotheses, depending on the representation of the reader.

The Awakening of the Reader

First, the reader can be seen as a good companion, hardly different from a guest, as someone the author wants to talk to and who he cares about. Rabelais' dedication of his books to forgotten parts of the population, such as the victims of syphilis or gout, serves as compelling evidence. All of them are outcasts, familiar to Doctor Rabelais, and more than any other readers, they need comfort. Reading is thus to be understood as a skilful therapy: all worries can be forgotten with a happy story, thus allowing jokes with the reader, who is to be treated like a friend. Hence, the apparent brusqueness is really a way of showing how close the author and the reader truly are. However, a second hypothesis is also possible. If the author skips a polite *captatio benevolentiae*, it is because he wants to provoke the reader, setting the right tone for the entire work. In a way, the prologues are meant to be a jolt to the system, a "shaking up" of the reader's mind so that he will be ready for any possible situation, however incredible it may be. Indeed, there will be plenty of unbelievable things, not only in relation to the characters' actions, but especially in terms of language and interpretation. The reader could be surprised or shocked: he is warned from the beginning that however strange the situations may be, they are not meant to be outrageous: "Readers, friends, if you turn these pages / Put your prejudice aside / For, really, there's nothing here that's outrageous / Nothing sick, or bad – or contagious" (*Gargantua*, "To the readers").

Very early on, from *Gargantua's* Prologue, Rabelais insists on the need to literally open the book along with one's mind, stressing the need to look inside the book to see what is hidden as there is something to be found which is not clearly visible. It might be hidden by a contradictory appearance, when a facetious episode turns out to be full of wisdom – if the reader is able to understand. The skill of "*sens agile*" (agility of the mind) is required. Rabelais asserts the need for interpretation and compels the reader to start thinking as this is the only way for him to be able to reach the essence, the "*substantifique moelle*" ("Then you must, by a curious reading and frequent meditation, break the bone and suck

out the substantial marrow. . .”). His metaphors – bones to break, dogs cautiously biting them, the bottle to be opened, a funny box revealing a precious drug inside . . . – all convey the idea that the title of the book and the appearance (the “literal sense”) of an episode are but a beginning; they need to be followed and refined by true reflection to be useful to the readers, who could then have access to the “*plus haut sens*” (the highest, or deepest, meaning).

The disconcerting endings of many episodes – and even of the book *Gargantua* itself – split between opposite interpretations of a single situation and illustrate this need for a meditative reader. If two possible meanings are presented, it is ultimately the reader’s duty to choose between them.

Rabelais’ novels all play with reader expectations, provoking surprise, delaying resolution, casting heroes who are not necessarily heroic, telling tales of strange travels, and introducing many possible worlds and many impossible conclusions. In short, the author presents a thorough exploration of many potential devices for fiction and for hermeneutics. To the early modern reader, all this would have been terribly disconcerting and fascinating.

Stepping into Modernity

The invention of the concept of “Pantagruelism” is a good example of a newly created feature in early modern prose. Rabelais formed this word from the name of the hero Pantagruel and then went on to define it several times throughout the five books. Pantagruelism is a moral quality, close to Pantagruel’s mood: a so-called philosophy described in the Prologue of the *Fourth Book* as “a certain gaiety of mind pickled in the scorn of fortuitous things.” The giant, whose reactions are always measured and wise, displays an attitude of calmness and security toward the exterior circumstances (“fortuitous things”) that do not depend on his will.

On one level, Pantagruelism can be defined as a philosophy derived precisely from the specific character of the novel’s hero and his very name. Moreover, it refers to a pragmatic attitude applied not only to Pantagruel himself but also to many

situations covered in the work. It can therefore be considered as a kind of behavioral feature, affecting relationships between good people: by following this kind of optimism and receptiveness, they can call themselves “Pantagruelists.”

On another, more general level, all five books make reference to Pantagruelism as the word can be used to describe an attitude toward both writing and the act of reading (*Gargantua* is said to be a “book full of Pantagruelism”). It is an open-minded attitude, never in position to argue with rage (contrary to the censors) or to be upset (see the aforementioned “put your prejudice aside”).

In light of all this, Pantagruelism is naturally recommended as a remedy against the poisonous attitude of the “*agelastes*” (agelasts), literally “those who do not laugh” or do not know how to laugh and who are therefore banned from the utopian Abbey of Thelema or even from reading the book itself. As a philosophy, Pantagruelism is not confined to fiction as it transcends this boundary and is also related to writing, reading, and acting. This philosophy, based on fiction, is all the more original, as fiction invents its own referential pattern, without referring to existing models of readers, thereby creating its ideal reader. This means that roles can shift. The hero, Pantagruel, the model for such an attitude, can be considered as the best reader of his own adventures, which are themselves written by an author declaring himself to be a Pantagruelist. The metaleptic movement of this entire system shows how fiction is on the brink of changes to come, where the boundaries between author, reader, and characters disappear or become blurred. Parallels are often drawn between Rabelais and Cervantes in this respect, as they were both two important sixteenth-century authors in the process of inventing a new satirical style of writing.

The character of Panurge also represents a great renewal in the typology of characters. Firstly, anything but epic, he is not a hero; he cannot fight, hates weapons, and always prefers fleeing, cunning, or craftiness to bravery. Still, however cowardly he may seem, he is not a meaningless character. On the contrary, he instantly becomes Pantagruel’s best friend and is the most relevant figure capable of shedding light on all the

others. He fails to meet expectations and contradicts the most famous character types. Disconcerting and apparently irrelevant, he is made of imperfections, but due to his constitutive ambiguity, he is a very modern and audacious character. By himself, Panurge is impertinent; he is one of the risks taken by Rabelais with respect to traditions. He is also, for this reason, the very symbol of adventure. This character's role is twofold: as an instrumental literary device that moves the narrative forward and, at the same time, as a tool enabling the author to add an important layer of intellectual depth.

Finally, the creative use of language is one of the most important devices and originalities of Rabelais' writing. He introduces many languages in his fictional works. First, there are no less than 13 foreign languages in Chapter 9 of *Pantagruel*, including imaginary ones (e.g., the Utopian language). Within the French language, the net is cast wide: for example, the regional terms for navigation in the *Fourth Book* are taken either from the Mediterranean or the Atlantic coast of France. The reader can also recognize many words from the region of Tours and Chinon, the author's birthplace, especially concerning wine and drinking. On the lexical side, not only did Rabelais use a vast lexicon, but he also created many neologisms by making unexpected, humorous combinations of existing words put together in monstrous and hilarious combinations. He also wrote long chapters consisting only of dizzying lists of words, the most famous being Gargantua's games (*Gargantua*, Chapter 22), the parodic list of the books of the Library of Saint-Victor (*Pantagruel*, Chapter 7), and the different lists of insults between Friar Jean and Panurge (*Third Book*, Chapters 26 and 28). All are epic moments of language jubilation and can be either read as parody, poetry, burlesque, or profound jokes and word games.

Impact and Legacy

With its numerous feasts, drinking episodes, and gluttony, and because Rabelais' prose was based on comic features, jokes, and scatology, a rather

mythical image of Rabelais has taken hold in people's minds. His fiction was considered immoral, joyful, but shameful and generally reduced to the idea of gigantic meals and feasts. Some so-called "ugly" parts were even censored and withheld from young girls until the first half of the twentieth century. All of these ideas originate in seventeenth- and eighteenth-century readers, who generally read Rabelais this way. Thanks to Victor Hugo, who celebrated the author's enormous and magnificent use of the French language, the nineteenth century approach to his work differed. With the same level of fascination as Hugo, Gustave Doré also magnified the epic scope of Rabelais' fiction through a visionary interpretation in his engravings. On the other hand, Louis-Ferdinand Céline, while paying tribute to Rabelais' sublime use of oral language inside written prose, contended that he "failed," because nobody had followed or adopted his style, and the French language had, in the end, not profited from this literary experience.

With respect to the history of the French language, apart from Céline's extreme viewpoint, the studies of Rabelais' use of language have highlighted lexical creation and its benefit for the enrichment of the dictionary. Many words remaining in common use come from Rabelais' first experiments, when he introduced Greek words into French (including "exotic," for instance).

Regarding the realm of ideas, many studies have pointed out Rabelais' evangelism, his use of Plato's philosophy, or of Greek philosophers in general. Mikhail Bakhtin had some merit in the "rehabilitation" of Rabelais, when he showed that the treatment of the lower part of the body is linked not to a perverse tendency for scatology nor to immoral purposes, but rather to the celebration of a form of carnival, of an upside-down image of society, as a way to question the organization of social hierarchies. Although this thesis has been much disputed, it has proven important for understanding Rabelais differently. Since the 1990s, what seems to be essential for readers and scholars is to consider both sides of his fiction together, that is, the serious ideological side and the merry amusing one, as the literal sense (on the

joyful side) sounds as important as the allegoric or the symbolic one, both parts making an equal contribution. Rabelais' fiction has the strength of introducing science into adventure stories, and creating compelling characters who are neither good nor bad, neither totally praiseworthy nor blameworthy. They are essentially ambiguous, and their status must be interpreted by the reader. Thus, Rabelais places interpretation at the center of reading so as to convey the constant need for vigilance. His growing concern in the novels with fixed meanings comes to its culmination in the 56th chapter of the *Fourth Book*. The episode of the frozen words perfectly illustrates this: frozen words, looking like magnificent colored pearls on the deck of the boat, need to be picked up and warmed in the hands of good Pantagruelists to release their sounds and reveal their meanings.

cultural artifacts and enshrined in ideology. Caricatures of the Jews emphasized their ineradicable internal difference from Christians: in the idea of the “blood purity” of the Jews propagated by the Spanish Inquisition can be seen the origins of a notion of biological race. Around the prevailing types and concepts, heterogeneous discourses can be discerned at a local and individual level. Racial theories generated debates in the fields of law and rights and were integrated into political relations and cultural practices over many fields (Erickson and Hulse 2000).

Race, Renaissance Concept of

Malcolm Hebron

Winchester College, Winchester, UK

Abstract

The classification of humans into distinct races is first recorded in the seventeenth and eighteenth centuries. Thus it may be doubted whether “race” is a helpful tool for the study of early modern thought. Nonetheless, embryonic concepts of race have been traced to the Renaissance. The period inherited a rich body of ideas of human types, drawing on classical and medieval authors. This material prompted speculation over human nature: Are qualities fixed or malleable? Are all peoples capable of reason and open to conversion to Christianity? Does humanity embrace all types or do some fall outside it? Throughout the period anti-Semitism provided a grim template for defining identity through the “othering” of a particular group of people.

Encounters outside the Mediterranean accelerated from the fifteenth century: the “discovery” of the New World, the enlargement of the slave trade, and expanding commercial networks all shaped perceptions of humans as belonging to groups with distinctive traits. Such mental taxonomies hardened into stereotypes which were disseminated through

Heritage and Rupture with the Tradition

Medieval Europe offers a diverse set of images of the peoples of the earth. These can be traced to classical sources, including fourth-century BCE Greek accounts of the figures of Indian art, which were apparently taken to be representations of actual people. Monstrous humanoid forms appear, for example, in the writings of Isidore of Seville (c.560–636), the tympanum of Vézelay Abbey (c.1100) which depicts differently formed peoples to be ministered to by the church, the *Travels of John Mandeville* (1357–1371), and the illustrations of the Nuremberg Chronicle (1493). These works do not necessarily equate physical with moral monstrosity.

In European consciousness, the Jews occupied a particular category. Over the late Middle Ages, aggressive anti-Semitism led to pogroms and expulsions. Jews were accused of magical powers; the “blood libel,” the accusation that Jews drank the blood of Christian children, dates from at least the twelfth century. Exclusion could foster a sense of exclusiveness. The Sephardic Jews wrote their own history, defining themselves as a separate race going back to the Jews of the Old Testament. From the eleventh century, crusades and pilgrimage heightened awareness of the Muslim Arabs, who were both demonized as enemies of the faith while at the same time their achievements were absorbed into the Western culture across scientific and artistic disciplines (Macdonald 1997).

Around these images of various people, questions arose, in particular the degree to which humans are fixed or self-fashioning. The intellectual community of the late Middle Ages and Renaissance did not unanimously hold racial identity to be an inherited absolute. Against types there is a countervailing concept of a human family: the Vézelay tympanum clearly expresses the idea that all corners of the earth are open to the Word of Christ. Biblical and patristic texts did not provide a coherent account of whether those of darker hue were or were not morally inferior, leaving room for a variety of views (Schwartz 1994).

Innovation and Original Aspects

One innovation was the body of ideas accompanying the encounter with American Indians and the increased trade in black African slaves. The plight of the Indians under the Spanish conquistadors was deplored in a series of polemics by the Dominican friar Bartolomé de las Casas (c.1484–1566). These fed the topic of Spanish cruelty, happily recycled by protestant countries like England, themselves culpable of atrocities. In the debates at Valladolid (1550–1551), de las Casas disputed with Juan Ginés de Sepúlveda (1494–1573) over the status of colonized people, an important moment in the development of rights theory and international law: at issue was the question of whether the Indians were, or not, fully human and thus free men by the law of nature.

As a strategy for justifying the slave trade, white Europeans developed stereotypes of black Africans as naked, pierced, lazy, sexually promiscuous, unintelligent, and the like. Though black Africans performed a diverse range of tasks, both as slaves and freemen, they are typically depicted in a limited range of activities, capable of imitative but not creative behavior (Earle and Lowe 2005).

Christian vilification of the Jews continued to be intense in the Renaissance. Myths such as the blood libel were quickly spread by the printing press. Preachers such as Bernardino of Siena (1380–1444) called on Jews to reside in special districts with special costumes and badges. In

1492 both Moors and Jews were expelled from the Iberian Peninsula. A range of tools was developed to test the sincerity of those who opted to convert; the Spanish Inquisition, in its demand for ethnically “pure” inquisitors, developed a sophisticated bureaucracy for enquiring into individuals’ lineage, an originating point for later notions of biological race. While the stereotype of the African tended to concentrate on external qualities, that of the Jew focused on a supposed ineradicable internal separateness from the Christian. Arabs were equally subject to stereotype, while at the same time the scholarly and artistic techniques they introduced to the West were appreciated by intellectuals and a vital source of cultural renewal.

As a highly flexible term, “race” was not only used of people outside Europe but also as an instrument in internal politics: thus, the English usually employed “race” to mean family lineage, excluding the socially inferior, and described the Irish as another race, exhibiting subhuman qualities (Hall 1995). Racial and national identities develop in parallel. In Shakespeare’s *The Merchant of Venice*, besides the much-discussed depiction of the Jew Shylock, characters from other European countries are also open to satiric delineation. Against this, to a modern reader, some of the most original visions of race come from intellectuals apparently resistant to prevailing typologies, such as the passionate Hebraist scholar Isaac Casaubon, who refused to characterize individual Jews by group characteristics, or Montaigne who, witnessing a circumcision in Rome, observed in his *Journal de voyage* that Jewish babies cried like Christian children at baptism (Grafton 2009).

Impact and Legacy

Renaissance racial thinking underpins imperial expansion and the justification of slavery, land-grabbing, and other forms of exploitation. It served to concretize the notion of humans falling into distinct and fixed categories, subject to pseudoscientific measurement of intelligence and other qualities. Black people formed a counterpoint to the developing notion of “civilized”

whites. In the cultural sphere, the notions of the noble savage and the earthly paradise were among discourses that flowed from the encounters of the fifteenth century onward, expressed in a variety of forms, from paintings to travelogues, essays, and drama. While the Renaissance notion of race is elusive, the stereotypes constructed in the period have proven very clearly to be destructive and persistent (The William and Mary Quarterly 1997).

Radical Moisture

Elisabeth Moreau

Department of History, Faculty of Philosophy and Letters, Fonds de la Recherche Scientifique – FNRS/Université Libre de Bruxelles, Brussels, Belgium

Abstract

The radical moisture is a Galenic physiological concept developed by medieval Arabo-Latin medicine, referring to an inborn moisture specific to living beings. Illustrated by the metaphor of the oil lamp, it is compared to an oily wick consumed by the flame of innate heat, whose extinction is synonymous with death. The vital moisture is involved in the physiological discussion on spirit and innate heat regarding the conservation of life. It also provides abundant parallels in chymistry developed by Platonic and Paracelsian physicians.

Synonyms

Humidum Primigenium; Humidum Radicale; Primitive moisture/humor

Heritage and Rupture with the Tradition

The definition of radical moisture is based on a medieval concept from Arabic medicine, inspired by Aristotelian natural philosophy and Galenic medicine (McVaugh 1974). In the tenth century, Isaac Israeli and Haly Abbas shaped the notion of secondary humors, including the alimentary humors and the radical moisture (Jacquart 2006; Reynolds 1999). Avicenna theorized the idea of the radical moisture in a general account of life, fever, aging, and death in his *Canon of Medicine*. The Galenic and Avicennian theory was then transmitted to Western Europe in the eleventh and twelfth centuries through Latin translators from Salerno and Toledo, e.g., Constantine the African and Gerard of Cremona. In the thirteenth

and fourteenth centuries, the medical debate on the radical moisture was explored in natural philosophy, alchemy, and theology, especially in the works of Albert the Great, Bonaventure, Thomas Aquinas, Arnold of Villanova, and Ramon Llull (Crisciani 2005; Crisciani and Ferrari 2010). From this medieval context, the decisive role of radical moisture in the conservation of life has given rise to various debates on its possible maintenance, decreasing or storing, in order to preserve the innate heat.

Scholastic physicians defined the radical moisture as a fatty humor feeding the spirit and innate heat. Received at birth alongside the spirit and innate heat, it is derived from the airy portion of the seed and the fleshy maternal blood substance. Within the human body, the vital moisture is in charge of fueling the innate heat, while the spirit is maintained and refreshed by breathing. Given its fixed quantity received at birth, the radical moisture undergoes a slow consumption, reflected by the aging process and mortality (Marinozzi 2010; Schäfer 2012). Moreover, corruption or premature consumption of the radical moisture may lead to specific diseases such as withering and hectic fever (Demaitre 1992; Niebyl 1971).

Among the traditional medieval topics related to the radical moisture, late Renaissance physiology concentrated on the metaphor of the oil lamp, as well as the relation between longevity, aging, and the inexorable consumption of the radical moisture (Fernel 1567; Hall 1971). Fernel underplayed the possibility of restoring the vital moisture through dietetic or chymical means, though he conceded the influence of nutrition on the preservation of radical moisture. Nevertheless, the chymical question of prolongevity through the restoration or the extraction of a vital substance would continue through Paracelsian medicine, as evidenced by the concept of balsam and vital sulfur (Severinus 1571; Hirai 2005; Bianchi 1982).

Raimondi, Cosimo

- Raimondi, Cosma

Raimondi, Cosma

Born: 1400, Cremona, Italy

Died: 1435/1436, Avignon, France

Pier Davide Accendere

Humanities Department, University of Eastern
Piedmont “Amedeo Avogadro”, Vercelli, Italy

Abstract

The humanist Cosma Raimondi (1400–1435/1436) was a native of Cremona and the pupil of Gasparino Barzizza (1360–1431). He helped to decipher an important manuscript of Cicero’s rhetorical works and wrote a well-known defense of Epicurus: *A Letter to Ambrogio Tignosi in Defence of Epicurus against the Stoics, Academics and Peripatetics* (1429). Leaving Italy, he moved to Avignon, where he later committed suicide.

Alternate Names

Raimondi, Cosimo; Cremonensis, Cosmus

Biography

Cosma (Cosimo) Raimondi was born in Cremona in 1400. In 1421 he moved to Milan, where he studied under Gasparino Barzizza (1360–1431), the eminent teacher of humanists such as Leon Battista Alberti, Pier Candido Decembrio, Francesco Filelfo, and George of Trebizond. Raimondi “attended Barzizza’s school for a period of 9 months in 1421–22” (Mercer 1979, 133). In the second half of 1421, Gerardo Landriani, Bishop of Lodi, discovered a very important manuscript of Cicero’s rhetorical works (the lost *Codex Laudensis*) containing *De Inventione*, *Rhetorica ad Herennium*, *De Oratore*, *Orator*, and *Brutus*. On the instructions of Barzizza, Raimondi

helped to decipher this Ciceronian manuscript. “That Bishop Landriani had the *De Oratore*, *Orator*, and *Brutus* sent immediately to Barzizza in Milan (1421–22) attests to the impressive mark which the latter had made as a textual scholar and Ciceronian expert. [...] Although he probably played little part in the technical work of deciphering codices – that was mainly the achievement of his pupil Cosma Raimondi – he supervised the undertaking and put his experience at the disposal of those scholars involved” (Mercer 1979, 74). In 1429, dissatisfied with his living and working conditions in Italy, Raimondi moved to Avignon, where he taught law and carried on his studies of rhetoric. In the same year, he wrote a well-known defense of Epicurus: *A Letter to Ambrogio Tignosi in Defence of Epicurus against the Stoics, Academics and Peripatetics*. In 1431 he wrote a brief work entitled *De laudibus eloquentiae* (“In Praise of Eloquence”), which he dedicated to Jean Cadart. After a failed attempt to return to Italy, Raimondi committed suicide in Avignon between 1435 and 1436. His last desperate words were addressed to his friend Nicola Arcimboldi in a tearful elegy: “If destiny deprives you of me, your friend, /And the atrocious storm submerges my poor being, /You shall make a tomb for me and honor it. /On the tomb, write these words for me: /Here you lie, o Cosma, to be lamented, you /The favorite of Virgil, Cicero, and all other poets!” (Garin 2008, p. 185).

A Letter to Ambrogio Tignosi in Defense of Epicurus and the Rupture with Tradition

The revival of Epicureanism which took place during the Renaissance was largely due to the recovery of two ancient sources: Lucretius’s *De rerum natura* (discovered by Poggio Bracciolini in 1417) and Diogenes Laertius’s *Lives of the Eminent Philosophers* (translated into Latin by Ambrogio Traversari in 1424–1433). Raimondi’s

letter in *Defence of Epicurus* “is the only thoroughgoing espousal of Epicurean ethical doctrine of the Quattrocento, preceding not only the widespread dissemination of the ancient sources on Epicureanism (Book X of Diogenes Laertius’s *Lives of the Philosophers* and *De rerum natura* of Lucretius) but also the popular dialogue of Lorenzo Valla, *On Pleasure* (1431)” (Davies 1997, 238). The letter is addressed to Ambrogio Tignosi, whose identity is still unknown: “perhaps a student at the Milanese University at Pavia” (Davies 1997, 238).

Raimondi defends the philosophical authority of Epicurus, whom he calls the wisest of men, and shows how unjustly Tignosi has attacked him: “I shall answer your letter and explain the whole matter in such a manner that you may actually be glad to return to the Epicurean camp you abandoned” (Davies 1997, 239). Raimondi maintains that the reason why the three ancient sects of Academics, Stoics, and Aristotelians had declared all of Epicurus’s opinions invalid was “because they were envious at seeing so many more pupils taking themselves to the school of Epicurus than to their own” (Davies 1997, 239).

Raimondi’s investigation concerns the complex subject of the supreme good, and he observes that Epicurus is criticized because “he is thought to have taken too effeminate a view on what the supreme good is, by identifying it with pleasure and using that as the standard to measure everything else” (Davies 1997, 239). His refutation continues with a critical analysis of the philosophical ideas about the supreme good held by the ancient Stoics, Academics, and Aristotelians. According to the Stoics, happiness is to be found in virtue alone; consequently, only the wise man is happy and, moreover, he remains happy even if he is tortured. Raimondi objects: “this is a position I most emphatically reject. What could be more absurd than to call a man ‘happy’ when he is in fact utterly miserable?” (Davies 1997, 239). As for the Academics, he does not even regard their view as worthy of refutation: “On these [. . .], though, I shall not need to dwell at length, as for them everything is uncertain. What sort of

philosophy is it that denies that anything is certain? I do not think that even the Academics themselves understood what they were saying. If the Stoics are madmen, the Academics seem to me quite insane” (Davies 1997, 241). Lastly, Raimondi examines the opinion of the Peripatetics and observes that “they are more difficult to refute. Not only do they have a standard of certainty, but they argue in such a way that there seems to be some substance to what they are saying” (Davies 1997, 241). The Peripatetics claim that the supreme good resides in the contemplation and study of the inmost mysteries of the universe; according to them, this is the greatest pleasure and the one in which true felicity resides. Raimondi disagrees, however, because his concern is human nature as a whole, and not just one part of it: “the Peripatetic thinker, no matter how profound, cannot be happy without external and bodily goods” (Davies 1997, 241). Indeed, when nature herself “was fashioning man, she polished her creation with so many little touches that he seems to have been made purely for enjoyment and to take advantage of every sort of pleasure. She endowed him with senses so distinct, varied and useful that though there were many different types of pleasure, there was none in which he could not share” (Davies 1997, 241). Therefore, Epicurus is right when he asserts that pleasure is the supreme good, since human beings are so constituted as almost to seem created for that aim. Furthermore, they “have a certain inherent mental disposition to seek and attain pleasure: as far as we can, we try to be happy and not sad” (Davies 1997, 242).

In the conclusion of the letter, Raimondi urges Tignosi, who has been seduced by the acumen of Stoic arguments and by the magnificence of the Academics and Peripatetics, to reform himself and to return to Epicurus’s camp: “turn then to embrace Epicurus, whose teaching I shall perhaps expound at more length if ever I have greater leisure” (Davies 1997, 243).

Cosma Raimondi’s *Defensio* attempts to rehabilitate the negative reputation of Epicurean

philosophy, traditionally associated in the Western Christian tradition with immorality, impiety, and lasciviousness: “the glaring theological errors of Epicureanism – denial of the immortality of the soul and of divine providence; belief that the universe had come into being by chance – ensured that it remained the pariah of ancient philosophies throughout the Renaissance” (Kraye 2007, 102). In particular, he retrieves the original and genuine sense of Epicurus’s hedonism (Wilson 2008, 18) as opposed to the stereotyped image of the Epicurean pleasure-seeking, a conceptual misrepresentation deeply dependent on the Christian interpretation. Raimondi writes about the Epicurean concept of pleasure: “if perhaps some think that by this Epicurus meant that we should spend our days wallowing in feasting and drinking, in gambling, games and the pleasures of sex, such a wastrel Epicurus would hardly deserve our praise. His teaching would indeed be lamentable if he wanted us to be gluttonous, drunken, debauched, boastful and promiscuous. But that is not what Epicurus in his wisdom said or recommended. In fact, so far was he from wanting us to live without virtue that virtue is actually essential for living up to his teaching, since it constrains and directs, as it were, all the bodily senses [...] and does not permit us to make use of them except when needed. Epicurus does not slide into pleasure in the manner of animals, without the exercise of judgement and when necessity does not require it, but rather enjoys it with restraint when it is right to do so” (Davies 1997, pp. 242–243).

Abstract

John Rainolds was the highest authority English Puritan theologian of the late sixteenth and early seventeenth century. He was educated at Corpus Christi College in Oxford, where he converted from Catholicism to Protestantism. He read Greek from 1572, and from his readings we received the discussion manuscript of Aristotle’s *Rhetoric*, the first critical work to be written on the text of the Greek philosopher. From 1578 Rainolds dedicated his studies to theology, highlighting in the *Sex theses* written in 1580 a steadfast commitment to Calvinism and a rigid anti-Catholic attitude. Rainolds soon became the figurehead of the Puritan movement in Oxford: the many religious public disputes, his charisma, coupled with the intellectual stature of Rainolds increased his authority to the point of attracting the attentions and suspicions of Elizabeth I, so the queen decided to co-opt Rainolds in the Anglican episcopate in order to “neutralize” him and appointed him Bishop of Lincoln in 1579. The theologian could not refuse the assignment; however, he was able to postpone his inauguration until he gained the coveted appointment of the president of Corpus Christi

College in 1598. Once James I Stuart ascended to the English throne in 1603, Rainolds confided in a Presbyterian sense reform of the Anglican church, which seemed possible when the king decided to convene a religious conference at Hampton Court. Here Rainolds led the Puritan delegation, but, despite the favorable conditions, the king did not make any concessions in ecclesiastical matters, and therefore, Rainolds only obtained the consent for a new English translation of the Bible, satisfying his expectations in the last years of his life, which ended in 1607 in Oxford.

Reynolds, John

Biography

Erudite scholar and prominent theologian of the English Puritanism, John Rainolds came to light in 1549 in a cultured and wealthy family: his father Richard was a rich farmer; his uncle, Thomas Rainolds, was vice chancellor of the University of Oxford; and his brother, William, became a professor of Theology in Reims. John Rainolds was educated at Merton College and then at Corpus Christi College, where since 1563 he was admitted as *discipulus* (Feingold 2004) and where he converted from Catholicism to Puritanism. We can assume that in 1569 the conversion was now well established, given that the Board commended him the tutorship of young Richard Hooker. He was awarded an MA in 1572 and was appointed reader of Greek. His lessons were guided by Christian and humanistic values: Rainolds recognized that classic literature played a central role in building morals and religious beliefs. The “pagan wisdom conveyed through Christian filters” (McConica 1979) was judged by the theologian as being particularly suitable for the education of youngsters. The readings given by Rainolds were the first critical study of the text of Aristotle’s *Rhetoric* (Rainolds 1986)

and became extremely popular on the Oxonian campus. He was ordained a priest in 1576, but 2 years later he left the lectureship of Greek to dedicate himself more fully to his theological studies. Rainolds highlighted *Sex theses* (Rainolds 1580) and embraced the Calvinist doctrines of *sola scriptura*, and in ecclesiastical matters, reaching strongly anti-Catholic positions. He won the support of influential figures such as Elizabethan aristocracy Dudley, Sidney and the Secretary of State Walsingham, who was replaced by the Earl of Essex when Walsingham died in the late 1580s. At the invitation of Walsingham, he argued publicly in Oxford and London with the Catholic John Hart, and this public debate was committed to print in *The summe of the conference* (Rainolds 1584). Again at the invitation of the Secretary of State, Rainolds held a theological polemic lectureship against Cardinal Bellarmine in 1586. He received his doctorate in theology in 1585 and became the key figure of the Puritan party in Oxford, and here the theologian had several contrasting opinions with some *religionis causa* because he suspected them of atheism or religious simulations.

The criticisms of the theologian had already led to clashes between 1575 and 1576 with Corro and Pucci, then in 1583 with Giordano Bruno. However, the longest and most bitter dispute which occupied Rainolds in Oxford was the one with the Italian jurist Alberico Gentili (Rainolds and Gentili 1977).

The clash, born from the dispute between the theologian and the playwright William Gager on the acceptability of academic stage plays, moved quickly on the crucial issue of the relationship between theology and jurisprudence (Rainolds and Gentili 1977). Rainolds maintained his firm stance against the Italian jurist: theology was the only *magistra vitae* of men, and it only had to be up the task of interpreting the divine laws and legitimize the political dictate. However, the puritanical zeal, intellectual stature, and charisma of the theologian aroused the suspicious attentions of Queen Elizabeth so much so that she put a stop to his appointment as president of Corpus Christi College in 1590 and co-opted the Anglican episcopate, by giving him the deanery of Lincoln in 1593. The

theologian was, reluctantly, forced to accept but procrastinated taking office in Lincoln until in 1598 he was finally appointed president of Corpus Christi College. When James I Stuart ascended to the throne in 1603, the Puritans presented the king with the Millenary petition, calling for a reform in favor of the Presbyterian Church over the Church of England. Hopes seemed to be on their side when the king summoned a religious conference at Hampton Court (1603–1604), particularly since the puritanical Rainolds was to head the delegation. However, Rainolds did not obtain any episcopal concessions from the king. In fact, James I was peremptory in sanctioning the principle of “no Bishop, no King” whereby there would not be any liturgical ceremonies. The Puritan theologian was nevertheless given the go-ahead for the preparation of a new English version of the Bible, to which he dedicated all his efforts in his last 3 years of life. John Rainolds died on May 21, 1607, leaving behind a reputation as being “one of the dominant figures of late sixteenth century Oxford intellectual life” (Schmitt 1983) and as an authoritative “pillar of the reformed churches” (Feingold 2004).

Abstract

The main aim of the French logician and philosopher Petrus Ramus was to provide a method of teaching the liberal arts enabling the completion of the undergraduate program of studies in 7 years. This method was based on a new logic, in which the complex structure of Aristotle's *Organon* and of the *Summulae logicales* of Peter of Spain were reduced to two main doctrines: the invention of arguments, by which it is possible to find the notions for reasoning and disputing in any discipline, and the disposition of arguments in judgment, i.e., in propositions and syllogisms. Since this logic applies both to demonstrative and to probable reasoning, Ramus and Rudolph Agricola, who first introduced it, labeled it as dialectic. Ramus completed this twofold dialectic with a method, according to which disciplines have to be taught by providing general definitions, to be explained by subsequent dichotomous divisions. According to Ramus, this method ensures a well-ordered hierarchy and division of disciplines, and an efficient means to teach them in a shorter time than in the pedagogical programs of Juan Luis Vivès, Johann Sturm, and Philipp Melanchthon. This method had its main diffusion in

the preuniversity institutions such as the German *gymnasia* and *gymnasia illustria* (e.g., of Herborn), while in Reformed and Catholic universities the acceptance of Ramism was hindered by the predominance of the Aristotelian curriculum.

Heritage and Rupture with the Tradition

The overall aim of Petrus Ramus (1515–1572) was to provide a reform of logic, or dialectic, in order to make it more suitable than scholastic logic for use in teaching the liberal arts. His dialectic was to be the basis of a 7-year program of studies in the liberal arts – outlined in an oration of 1551 (Ramus 1551) and explained in his *Scholae in liberales artes* (1569) – which he devised for boys from 8 to 15 years old, and which would replace both preuniversity instruction and undergraduate academic studies. This aim can be traced back both to his personal circumstances, since Ramus worked as servant before obtaining his MA at the University of Paris in 1536, and had to study with limited time and resources, and to the effort of the French king François I^{er} to limit the power of the university, based on the scholastic curriculum, by creating Royal Professorships – like that bestowed on Ramus in 1551 – and the Collège Royal in 1529, modeled on the humanist program of the *Collegium trilingue* of Louvain, inspired by Erasmus. Ramus's reform was part of a long-standing innovation in logic conducted by Rudolph Agricola, Juan Luis Vives, Johann Sturm, and Philipp Melanchthon, whose main change with respect to scholastic logic was to the order in which judgment and invention were treated in Aristotle's *Organon* and the *Summulae logicales* of Peter of Spain, the main logical texts in European universities. Moreover, Vives, Sturm, and Melanchthon provided new pedagogical programs for undergraduate students, which inspired and favored the acceptance of Ramism as the backbone of a shortened curriculum of studies. Their theories constitute the background of Ramus's reform (Skalnik 2002, 11–34, 63–87; Hotson 2007, 38–51).

Ramus refers to the *Summulae* in his *Scholae in liberales artes* (the texts of his lectures in Paris), labeling this work as useless for disputing and for acquiring skill in any discipline of the university curriculum (Ramus 1569, *Scholae dialecticae*, col. 153). Probably written by Pope John XXI (see Peter of Spain 2014), the *Summulae* was the most important example of a genre of logical textbooks which emerged in the thirteenth century, including manuals as those of William of Shyreswood and Lambert of Auxerre. The main function of the *Summulae* was to provide a textbook of logic covering the major topics of Aristotle's *Organon* and to serve as tool for conducting university disputations. In the *Summulae*, logic is defined as the "science of sciences or art of arts possessing the way to the principles of all methods," and consists of a theory of propositions, predicables, categories, syllogisms, topics (or places), and fallacies, which are dealt with by arguments taken from Aristotle's *Organon*, Porphyry's *Isagoge*, and Boethius's *De topicis differentiis*. Added to these matters were different sections (*parva logicalia*) devoted to topics debated during the Middle Ages: supposition, relative terms, extension, appellation, restriction, distribution, and exponible. Although attacked by Ramus for not providing a viable method of disputing and improving knowledge, the *Summulae* paved the way to a new kind of logic, in which the theory of invention of places or arguments precedes the explanation of their arrangement in judgments, i.e., in propositions and syllogisms. In the *Organon* of Aristotle, indeed, the treatment of places and of probable reasoning (dealt with in the *Topica*) comes after that of categories, syllogisms, and scientific demonstrations, treated in the *Categoriae* and *Analytica priora* and *posteriora*, on the assumption that judgment is to be taught before the notions which constitute its matter and that scientific demonstrations have a priority over probable reasoning. The *Summulae* contains, as does the *Organon*, a treatment of places, which are, according to the definition given by Cicero in his *De topicis* and restated by Boethius in his *De topicis differentiis*, "seats of arguments," and function as headings or sources of arguments which can be used as middle terms for syllogisms in any discipline. Places are ontologically loaded, i.e., they provide notions of

things: for instance, the *Summulae* offers an ontological conceptualization of substances, as these are signified or represented by substantive names. However, the *Summulae* lacks the theory of scientific demonstration contained in Aristotle's *Analytica posteriora*: the theory of places (treatise V) is dealt with just after that of syllogism (treatise IV). In this way, in the *Summulae* reasoning is reduced to a matter of probability instead of apodictic or scientific certainty. Logic, therefore, is equated to dialectic and is intended as an instrument of persuasion rather than of demonstration (Peter of Spain 2014; Ong 1958a, 55–67).

While Ramus refers in negative terms to the *Summulae*, he praises the dialectic of the Dutch humanist Rudolph Agricola (Ramus 1569, *Praefatio*). Agricola attacked scholastic logic for the first time in his oration *In laudem philosophiae*, delivered in Ferrara in 1476 (Agricola 1518): in this text he appropriates the Stoic tripartition of philosophy into logic, physics, and ethics, excluding metaphysics as a branch of philosophy separated from logic. Moreover, he stresses the connections between grammar, rhetoric, and dialectic, which all contribute to the constitution of logic itself: grammar provides the formal basis for the comprehension of any discourse, dialectic serves to find or "invent" the places which make it possible to solve any kind of question, and rhetoric provides discourse with a disposition which makes it fit to persuade people. Agricola assumes these ideas on logic as guidelines in his *De inventione dialecticae* (1515, 1992). As it would be for Ramus, the main aim of Agricola is to reform logic in a way leading it to be more suitable for finding arguments for philosophy: in his view, natural and moral philosophy. For Agricola the logic of Aristotle and of the *Summulae* does not provide a reliable instrument to this end; he thus provides a reorganization of the matter of the *Organon* and the integration of logic with rhetoric; this integration is finalized to develop a logic or dialectic intended as "*ars probabiliter disserendi*," i.e., the art of discoursing with probability, rephrasing the definition of dialectic of Cicero as "*ars bene disserendi*," given in the *De oratore*: this art of discoursing, for Agricola, is also the art of discerning concepts. Agricola's *De inventione* is divided

into three books: the first is on the invention of places, the second is on the nature and use of dialectic, while the third is on the rhetorical means used in support of dialectic itself. The finding of places, which he appropriates from Aristotle, Themistius, Cicero, and Quintilian, consists of the establishment of tables ordering the concepts to be used in every discipline, being thus commonplaces. Agricola distinguishes between internal places, which define a subject according to its essence (e.g., definition, species, genre, proper, whole, part, adjacent, act, and subject) and external ones (e.g., cause, end, event, place, time, and so on). The definition of places themselves, such as what is a genre, difference, and so on, is left out of dialectic, as it belongs properly to metaphysics, which is now excluded from the domain of dialectic. The invention or finding of places precedes judgment, i.e., their disposition; however, judgment is treated in a scattered way by Agricola, who focuses instead on a theory of discourse appropriated from Cicero's rhetoric: this is divided into narration and confirmation (aimed at teaching), and exordium and peroration, which serves to move the listener or the reader. Judgment, on the other hand, is divided into induction or enumeration and syllogism (which are perfect forms of argumentation) and example and enthymeme (incomplete syllogisms). What is new in Agricola's account, with respect to scholastic logic, is that judgment relies on rhetorical means, as well as on the invention of places. This link between the two disciplines, on the other hand, was rejected by Ramus, who completed Agricola's reform by adding a comprehensive theory of judgment. Secondly, Agricola substitutes Aristotle's categories with places, which differ from categories as headings of modes of predication rather than of what is predicated (e.g., relations are listed under categories, while related things are set under places). This innovation was also incorporated in Ramus's dialectic (Vasoli 2007, 225–273; Ong 1958a, 96–130).

Secondly, Ramus was influenced by the innovations of Vives, who aimed, as did Sturm and Melanchthon, at both a logical and a pedagogical reform. Vives, who taught at the *Collegium trilingue* of Louvain, criticized scholastic logic first in his *In pseudodialecticis* (1519, 1979), inspired

by Agricola's *De inventione*. The main concern of Vives was with the uselessness of scholastic logic, represented by the *Summulae*, which for him – in line with the criticisms of Lorenzo Valla of the abstruse character of scholastic terminology – could not provide a method for discourse, as it relied on obscure metaphysical concepts which were not used in common linguistic practices. On the other hand, in his *De tradendis disciplinis* (1531) Vives delineates a dialectic based on the natural functioning of the human mind and capable of guiding it in the practice of discourse. For him, dialectic is simply the art of disputing and has no metaphysical function, which on the other hand characterized Aristotle's *Categoriae* and *Topica*, which are based on the concepts of difference, genre, and species and turn to be ontologically loaded, as in the *Summulae*. Vives dialectic is directly subservient to the liberal arts: it is an inventive logic aimed at finding places and arguments common to every discipline, to be dealt with in argumentation, or at connecting propositions by means of enumeration, induction, and syllogism. The basis of any argumentation is given by definition and division, by means of which places are identified and serve to provide the basic concepts of discourse. Vives's dialectic is naturally connected to rhetoric, since any discourse, since it is aimed at persuasion, relies on both disciplines. Moreover, given the new organization of dialectic, Vives reduces rhetoric to elocution from its classical fivefold division into invention, disposition or judgment, elocution, pronunciation, and memory. All the other parts more properly belong to dialectic itself, including pronunciation, which is reduced to elocution, and memory, which is reasoning itself (Vasoli 2007, 319–362). The dialectic devised by Vives was to be included in a renewed program of studies: as he explained in *De tradendis disciplinis*, undergraduate students had to study Latin and Greek for 8 years (from the age of seven), followed by the liberal arts (dialectic, physics, metaphysics, and mathematics) for 10 years, and then the higher arts (Hotson 2007, 39).

It was, however, the logic of Sturm and Melanchthon which constituted the immediate background to Ramus. Their programs are crucial

for a comprehension of Ramus's dialectic, as they took into consideration the method within logic itself, as Ramus would later do. The problem of method had been already discussed in treatises on various topics such as the *De methodo gravitatis sive virtutis commode dicendi* (1531) by the ancient rhetorician Hermogenes, the *Methodus conscribendi epistolas* of Christoph Hegendorf (1533), and in Erasmus's *Ratio vel compendium verae theologiae* (1519). In these texts method was considered as a *via* or *ordo* in the context of teaching. With Melanchthon, method is dealt with for the first time in a logical context. He first mentions the problem of method in the 1537 edition of his *Dialectica* (Melanchthon 1537), defining it as a criterion for the teaching and exercising of any subject, and offering three main examples of method: Avicenna's *Canon*, valid for medicine; Quintilian's *Institutio oratoria*, for rhetoric; and St Paul's *Epistolae*, for catechism. He does not, however, provide a comprehensive theory of the method, focusing instead on dialectic. Two years later, Johann Sturm – whose lectures in Paris were attended by Ramus – treated method in his *Partitiones oratorias Ciceronis* (1539a), where he distinguishes between art and method: art is the collection of propositions and observations useful for practice, while method is a procedure of teaching and serves to establish arts themselves. Method is threefold: (1) “systasis,” which proceeds from simple notions to general conclusions; (2) “analysis,” or the resolution of complex notions into simple ones; and (3) “diaeresis,” consisting of division or definition. These methods are derived from Galen's *Ars medica*, although Sturm renders “synthesis” – the term employed by Galen – as “systasis,” which is borrowed from rhetoric. In the 1543 edition of his *Partitionum dialecticarum libri* this threefold characterization of method is transferred from rhetoric to dialectic or logic. The first book of the *Partitionum dialecticarum libri* (1539b) is devoted to invention while the second to analysis (which consists of the use of syllogisms to resolve any kind of argumentation), thus matching Agricola's reorganization of logic. In a third book, added in 1543, Sturm included a section on method, changing the name of “systasis” to

“synthesis” or composition; this threefold method serves, for him, to teach all the arts and the subjects of the university curriculum, although he is not clear about showing how it is to be employed. Finally, Melanchthon, on the basis of Sturm, introduced an entire section on method in the 1547 edition of his *Erotemata dialectices* (Melanchthon 1547), which came out 1 year after Ramus's 1546 edition of *Dialecticae institutiones* (published as *Commentarii dialectici tres*, under the name of Omar Talon), in which Ramus introduced for the first time his own notion of method. In the *Erotemata*, Melanchthon, like Agricola, divides logic or dialectic into invention and judgment; however, he maintains the more traditional sequence of judgment (Books I–III) and invention (Book IV), and puts the treatment of method together with that of judgment, in Book I. Nevertheless, method still had an inventive function, as its aim was to find the “places,” i.e., to organize concepts in the right order and then to teach them. Accordingly, method is both a way of discovering and of exposition, as it also was for Ramus (Vasoli 2007, 405–475; Ong 1958a, 231–239). Both Sturm and Melanchthon, moreover, planned and realized a change in the undergraduate curriculum: Sturm reorganized the teaching of the gymnasium of Strasbourg on a ten-class model, including all the subjects of the liberal arts, which provided a model for the reform of pedagogy in western part of Germany. On the other hand, Melanchthon set up a more traditional program for the *gymnasia* of the eastern part of Germany, according to which preuniversity education was based on the *trivium* only (Hotson 2007, 40). The pedagogical efforts of Sturm and Melanchthon are crucial for understanding the dissemination of Ramism in Germany and for its internal transformation.

Innovative and Original Aspects

Although Johann Freige reported in his *Vita Petri Rami* (1575) that Ramus started his attacks on Aristotelianism by defending the thesis “everything that was said by Aristotle is wrong” during his MA examination, his approach towards

Aristotelianism did not entail a wholesale rejection of scholastic logic, i.e., of the of the *Organon* and the *Summulae* (Ong 1958a, 36–49). The innovative aspects of Ramus’s dialectic with respect to scholastic logic, in fact, were the introduction of a theory of invention as the first part of dialectic and the development of a theory of judgment and method which was omitted by Agricola. Ramus presented his ideas on logic for the first time in his *Aristotelicae animadversiones*, published in 1543 together with the *Dialecticae partitiones* (Ramus 1543a and 1543b), which was reissued in the same year as *Dialecticae institutiones* (Ramus 1543c, Ramus 1964) and then evolved into his *Institutionum dialecticarum libri* (1553) and *Dialectique* (1555a) (for a complete account of Ramus’s editions, see Ong 1958b). In his *Animadversiones* Ramus outlines a history of logic according to which dialectic had its highest development with Plato, who equated it with metaphysics itself, and was then corrupted by Aristotle and post-Aristotelians such as Theophrastus, Eudemus, and Chrysippus. Aristotle and his successors, indeed, made dialectic or logic into an overly abstract discipline, so that it was unfit for any real use in philosophy and the arts. In order to amend this corruption, Ramus first analyzes their theories in the *Aristotelicae animadversiones* and then proposes his own logic in the *Dialecticae partitiones* and *Dialecticae institutiones*. The *Organon* is treated in accordance with a scheme that Ramus appropriates from Agricola: invention is considered by commenting on the *Categoriae*, *Topica*, and Porphyry’s *Isagoge*, while judgment is dealt with in commenting on *De interpretatione* and the *Analytica priora* and *posteriora*. To this scheme Ramus adds a section on the practice or use of dialectic, treated in commenting on Book VIII of the *Topica* and on *De sophisticae refutationes*. However, the criticisms contained in the *Animadversiones*, as noted by Ong, cannot be summarized in a consistent way, as Ramus systematically misrepresents Aristotle’s positions (Ong 1958a, 174). He attacks Aristotle’s *Categoriae* as not providing a reliable classification of beings, while the *Topica* are mainly devoted to metaphysical issues such as the nature

of definitions, accidents, genus, and properties. In the *Topica*, moreover, Aristotle misunderstands the role of dialectic, considering it not as the art of reasoning and discoursing – as it was for Plato – but rather as the art of reasoning with probability. Finally, Ramus criticizes Aristotle for not providing any account of second judgment, which is the use of dialectic in long chains of arguments (which would be treated by Ramus as the method or order), and third judgment, or the use of dialectic as metaphysics. In order to restore the original function of dialectic as the art of reasoning and discoursing, Ramus provides in his *Dialecticae partitiones* and *Institutiones* a three-fold division of dialectic and of its treatment, which consists of: (1) “natural” dialectic, (2) dialectic as an art (*ars*) and as a doctrine or teaching (*doctrina*), and (3) the exercise of dialectic. For Ramus, this scheme is the basis of the presentation of any art (Hotson 2007, 47–48). Dialectic is defined, first, as the *virtus disserendi*, i.e., the natural power of discoursing, discerning and the use reason itself, which is a natural ability. Secondly, dialectic is an art, consisting of the imitation of this power, as well as of the classical models, above all, Cicero, as Ramus explains in his *Ciceronianus* (1557a). Accordingly, dialectic is based on the actual practices of discourse which one can find in any discipline. Moreover, dialectic is a doctrine, i.e., it teaches the ways of discoursing and reasoning: it is the *ars* or *doctrina bene disserendi*, as it was for Cicero, and serves to correct natural discourse by making it well formed. In addition, it is used to dispute, i.e., to answer questions or solve problems; therefore, in Ramus’s 1555 *Dialectique* (Ramus 1555a, 1996), dialectic was redefined as the art of disputing well. Since it is aimed at answering questions, Ramus accepts Agricola’s foundation of dialectic on a theory of the invention of arguments. In order to answer the question “whether man is a dialectician,” for instance, Ramus proposes to find a means to connect (or dissociate) the subject and predicate of this sentence, what he calls the “major” and “minor” part of the question. This is made possible by a syllogism with a middle term that connects these parts. In this case, the middle term “invented” is “rational,” by which one can

demonstrate that man is a natural dialectician. Therefore, Ramus proposes a list of places for all kinds of middle terms or arguments, by which he seeks to replace categories themselves. Furthermore, as stated in his 1555 *Dialectique*, he wants to substitute places as “seats of arguments” with arguments themselves, insofar as arguments are parts of places. In the 1543 editions of his dialectic (Ramus 1543b and 1543c), there are 14 places: five first arguments (causes, effects, subjects, adjuncts, disagreeing) and 9 derived arguments (genus, form, name, notations, conjugates, testimonies contraries, distributions, definitions). This list, in fact, would undergo several changes in later editions of the work. Arguments are then treated in relation to judgment, which concerns their collocation or disposition (*dispositio*); there are three kinds: first judgment, i.e., syllogism (including induction, example, and enthymeme, which are syllogisms defective in some part); second judgment, i.e., the concatenation of arguments; and third judgment, which is the use of dialectic as a metaphysics or a rational theology. The treatment of first judgment is based on Aristotle’s *Analytica*, although Ramus does not consider induction, example, and enthymeme as probable syllogisms, as Aristotle did, but only as defective ones, like Boethius. If first judgment allows to answer singular questions, second judgment allows to conduct a whole discourse and proceeds by a series of definitions and divisions, of which the demonstration consists. Demonstration, indeed, for Ramus, does not have the character of a proof, but rather of an explanation. This is noticeable above all in his mathematical writings; for instance, in 1545 Ramus published a Latin edition of Euclid’s *Elementa* (Euclid 1549), but with no diagrams, in order to make them less expensive and suitable for use by students, as it provided only explanations. Thirdly, judgment is used by Ramus as a metaphysics or rational theology, insofar it concerns the rational structure of reality: in this case, Ramus (like Plato) envisages dialectic as a move towards divinity. Finally, dialectic can be seen as the use or practice of the precepts conveyed by its doctrinal part, across various disciplines: in this respect, dialectic is not a habit of the mind (*habitus intellectualis*) or an instrumental discipline guiding

other arts and philosophical disciplines, but is itself a discipline concerning discourse and reasoning as such. It consists of the reading of texts and of their interpretation by examining the disposition of arguments, finding the goal and cause of the discourse, and using syllogisms to analyze or resolve it into a clear structure. Accordingly, interpretation is defined by Ramus as analysis, while the composition of texts is its form in reverse, i.e., genesis or synthesis.

This threefold structure of logic was maintained by Ramus in the editions of the *Dialecticae institutiones* which appeared after 1543, although with the introduction of a theory of the method, i.e., of second judgment and the omission of third judgment. In the 1572 edition of this work, for instance, Ramus reduces judgment as whole to *iudicium axiomaticum*, i.e., proposition, which was neglected in the first two editions, and *dianoeticum*, which includes syllogism and method. In 1546, he presented a full account of method in his *Dialectici commentarii tres* (published by Talon, Talon and Ramus 1546), as part of the treatment of disposition (Book II). Method is presented by Ramus as twofold. First, it is a method of teaching, which is the arrangement of knowledge from general to particular notions; according to this method, one first has to establish all the definitions and precepts of an art and then to proceed into its parts. Grammatical teaching, for instance, starts with the general definition of grammar and then proceeds into its branches. Such a division is made by means of dichotomies: this procedure has no theoretical justification in Ramus’s texts and may be motivated by his overall aim of providing a simplified teaching of academic disciplines. The division of different matters, in fact, was thoroughly refined by Ramus in the course of the various editions of his dialectical treatises: in the 1547 edition of his *Dialecticae institutiones*, for instance, one can find fully at work the use of tables of division, which serve to explain the matter of every discipline. As argued by Ong, the method of dichotomies made Ramist dialectic a “visual” representation of thought (Ong 1958a, 199–202). Second, Ramus introduces a “method of prudence” that prescribes how to dispose notions

according to the actual conditions of the audience, but whose treatment was not taken further in his works. The topic of the method, in fact, underwent several changes through the editions of his works and was omitted in the 1569 *Scholae dialecticae* (part of the *Scholae in liberales artes*), where the reader is redirected to the *Dialectici commentarii tres*. The final version of Ramus's method can be found in his 1572 *Dialecticae libri*. The main variations with respect to the first formulation of the method, on the other hand, can be found in the 1555 *Dialectique*. In 1555, he updated his method of teaching in light of the difference between what is known better either according to its nature (*notiora naturae*) or according to our mind (*notiora nobis*). For Ramus, the method of teaching corresponds to the order of what is known better according to nature, as this made it possible to equate the two kinds of order. This point is clarified in an excerpt from Book IX of the 1556 edition of the *Aristotelicae Animadversiones*, published in 1557 ("*Quod sit unica doctrinae instituendae methodus*", Ramus 1557b): there he deals with the problem of the "priority" of notions. For Ramus, as for Aristotle, in knowing we start from particulars, which are *notiora nobis*; however, by means of education it is possible to make the apprehension of the general more easy than that of the particulars: in this way, priority of nature and of time coincide. On the other hand, after the 1555 *Dialectique*, the method of prudence disappeared from Ramus's works: in his 1569 *Dialecticae libri* (Ramus and Talon 1569), for instance, he is committed to only one method, although divided into two: one for philosophy and arts – which is method as such; and the other for historians, orators, and poets, which differs from the former in that it teaches us how to convey probable premises to an audience as if these amounted to perfect knowledge; in order to do this, poets, historians, and orators have to reverse the order of exposition and start with conclusions. In this edition, moreover, method is based on an axiomatic theory: that is, instead of beginning with general definitions, the method starts with axioms which are known by themselves or by syllogisms, and proceeds by means of the general to the particular as from antecedents to

consequents; however, Ramus does not clarify how this progression from antecedents to consequents works. Finally, in the 1572 *Dialecticae libri* method is equated with "dianoia" or intelligible order, and is guided by three rules, also called "rules of philosophy" by Ramus. These rules are appropriated from Aristotle's *Analytica posteriora*, where they show how to conduct a scientific demonstration, i.e., a *demonstratio propter quid*. For Aristotle, these laws are the: (1) *lex de omni*, (2) *lex per se*, and (3) *lex de universali*, and they prescribe that in a scientific demonstration: (1) the subject is to be taken in its full extension, i.e., without restrictions to its validity; (2) the predicate has to be linked by essence to the subject; and (3) the predicate cannot be more extended than the subject. Ramus intends such laws as the guidelines for proceeding in any discipline, and he renders them as (1) the law of necessary truth, according to which a statement in one art has to be absolutely and necessarily true, and, therefore, has to be taken without restrictions and has to be necessary to the given art; (2) the law of justice or homogeneity, according to which statements in one art cannot be used in other arts; and (3) the law of wisdom, according to which all the statements in one art have to be compatible and not confused with each other – for instance, general and particular statements have to be dealt with separately. The provision of such rules had the function of making the teaching of disciplines more efficient by avoiding any meddling between different fields of knowledge and by providing an order of teaching from the more general to the more particular. In accordance with these rules, for instance, general disciplines such as logic and arithmetic have to be taught first in the curriculum. The foremost example of such meddling is the confusion between metaphysics and logic characterizing the Aristotelian tradition – in Ramus's account – as Aristotle dealt with logical notions (such as cause, opposition, comparison, genre, and species) in metaphysics and vice versa. The relation of these disciplines is resolved by Ramus by reducing metaphysics to dialectic itself, as it was for Plato (Pozzo 2000; on Ramus and method, see Ong 1958a, 245–263; Jardine 1974, 41–74; Bruyère 1984).

Ramus's Platonism and his use of the laws of philosophy can be seen in his dealing with mathematics. In his *Oratio de studiis mathematicis* of 1544 (Ramus 1544), Ramus expresses the highest appreciation for mathematics, as it was used by Archimedes for practice and by Plato for contemplation, i.e., paving the way to dialectic as the highest science and to its use as a third judgment. Moreover, in the preface to his edition of Euclid's *Elementa* (1549) Ramus labels mathematics as part of the natural dialectic, and, as soon as he identifies dialectic with metaphysics, he can set forth a correspondence between the mathematical, the rational-dialectical, and the divine domains. In his mathematical textbook, *Arithmetica* (1555b), however, Ramus changed this view (apparently after having difficulties in dealing with mathematics) and came to consider that Euclid had violated two of the laws of method, since he broke the law of homogeneity by mixing geometry and arithmetic, and the law of wisdom, since he started with geometry, whereas the treatment of quantity (in arithmetic) has to come first. Finally, in the *Proemium mathematicum* (1567), later expanded as the *Scholae mathematicae* (1569, which was part of the *Scholae in liberales artes*), Ramus criticizes Plato as a philosopher, on the grounds that he was responsible for the corruption of mathematics, which in his hands became an overly abstract discipline; and he also criticizes those ancient mathematicians – such as Euclid and Archimedes – who did not apply mathematics to practical disciplines (Goulding 2010).

The distinction between different kinds of art is reflected, moreover, by the sharp differentiation formulated by Ramus between dialectic and rhetoric. This differentiation is at work, for instance, in his *Brutinae quaestiones in Oratorem Ciceronis* (1547), where he attacks Cicero's and Quintilian's rhetoric for lacking a clear order, i.e., of treating grammatical and dialectical topics within rhetoric itself, and of giving a misleading order of the disciplines. Cicero, for instance, subordinated the knowledge of rhetoric to that of philosophy. Although rhetorical means were integrated into dialectic in the scholastic and humanist traditions, the aim of Ramus in establishing his rhetoric was to differentiate it from dialectic. The

traditional scheme of rhetoric – which can be traced back to Cicero's *De inventione* – included five parts: invention, disposition or judgment, elocution, pronunciation, and memory. Since invention and disposition had been included in dialectic, and since the art of memory is useless insofar as our knowledge always has to start with general notions and then proceed by following a natural order, Ramus considers that only elocution and pronunciation are branches of rhetoric. His rhetoric can be found in 1544 Talon's *Institutiones oratoriae* (Talon and Ramus 1544), likely written by Ramus himself, and in Talon's *Rhetorica* (1548), deeply influenced by Ramus, who then rewrote this text in its 1567 and 1569 editions (Talon and Ramus 1567, Talon and Ramus 1569); so, Ramist rhetoric was composed by the "Ramus-Talon team" (Ong 1958a, 270–271). These texts served to complement Ramus's *Institutiones dialecticae*. This treatise of 1545 follows the same threefold structure which Ramus imposed on dialectic. Intended as the power of speaking well, or "*vis bene dicendi*" (as defined in Quintilian's *Institutio oratoria*), rhetoric consists of (1) natural eloquence, (2) the art and the teaching of eloquence itself, and (3) its exercise. Natural eloquence is based on two main powers: thought and discretion of thought, corresponding to invention and disposition, which are then systematized in the art of rhetoric. In Talon's 1548 *Rhetorica* these parts are replaced by elocution and pronunciation or delivery, which, however, is almost entirely neglected; indeed, in this text the art of rhetoric consists of elocution alone, which is the ornamentation of speech provided by tropes (i.e., metaphors) and rhetorical figures. Thirdly, there is the exercise of rhetoric, which is divided, like dialectic, into interpretation (which is the analysis of the ornaments of speech), and writing and speaking, which are guided by the imitation of classical models. This third part, however, is also omitted in the 1548 *Rhetorica*. Eventually, Ramist rhetoric was restricted to a theory of the ornaments of speech, which are dealt with according to the Ramist method of analysis from the general to the particular in the 1567 and 1569 editions of the *Rhetorica* (Ong 1958a, 270–279; Meerhoff 1986, 175–199; Mack 2011).

Impact and Legacy

Ramism, across the different geographic areas of its reception, mainly influenced the disciplines of the *trivium* taught in Latin schools and *gymnasia*, where students were prepared for the study of philosophy at university faculties of arts. This phenomenon was due to the distinctive character of Ramus's teaching, which was primarily aimed at a reform of dialectic and rhetoric. Moreover, the limited dissemination of Ramism in universities was the result of resistance to innovation in the traditional teaching of logic on the basis of the *Summulae* and commentaries on Aristotle, Porphyry, and Boethius. This is clear in the main countries where Ramus's thought was received. First and foremost, Ramism characterized the teaching of logic in the *gymnasia* and *gymnasia illustria* (i.e., academies entitled to give bachelor and master degrees) in Central Europe, specifically in the German-speaking cities of the lower Rhine area, in northwest Germany, and in the Hanseatic cities. In France, Ramism had its main diffusion before the death of Ramus in the massacre of St Bartholomew's Day (1572); however, only his rhetoric was widely accepted at the University of Paris, because the entrenched Aristotelian logical tradition there prevented the acceptance of Ramus's dialectic. Along with Talon, the foremost French Ramists were Antoine Foquelin, who wrote a *Rhetorique françoise*, published in Paris in 1555 (Foquelin 1555), and Christophe de Savigny, who wrote a *Tableaux accomplis de tous les arts libéraux* (1587) presenting a Ramist dialectic and rhetoric (Ong 1958a, 295–298; Meerhoff 1986, 320–325; Angelini 2008). After the St Bartholomew's Day massacre, André Wechel – the publisher of Ramus in Paris (Maclean 2009, 163–226) – moved to Frankfurt, and German cities became the leading centers of European Ramism, as reconstructed by Howard Hotson. The works of Ramus and Talon on dialectic and rhetoric went through 27 editions in the area of Dortmund–Düsseldorf: Ramist logic became the standard at the Dortmund *gymnasium*, where it was taught by Johann Lambach from 1543 to 1582, and was then spread by Bernhard Copius, rector of the *gymnasium* of Lemgo

(1559–1566), and by Heinrich Betuleius, who taught in Essen, Soest, Wesel, Düsseldorf, and Lemgo (1557–1581). In Düsseldorf, Ramism was introduced by Franciscus Fabricius of Düren and was then consolidated by the teaching of Betuleius, Lazarus Schöner, Martin Hoping, and Sylvester Pribenius (from 1559 to 1609). In Hessen, Ramism was introduced at the Marburg *Paedagogium* by Wilhelm Roding, who published Ramus's *Dialectica* in 1574 (Ramus and Roding 1574). It was the *Landesschule* of Korbach, however, the first main center of German Ramism: founded in 1578, this preuniversity school was directed by Schöner, who provided editions of Ramus's mathematical writings; moreover, Wilhelm Adolf Scribonius taught dialectic, rhetoric, physics, astronomy, ethics, and medicine in Korbach using the Ramist method of dichotomies, thus broadening its use outside the boundaries of the *trivium*. From Korbach Ramism was transplanted into northern Germany: into Kassel, by Jodocus Jungmann, from 1581; and into Stade, by Copius's son-in-law, Reiner Lange, from 1587. Moreover, it was from Korbach that Ramism was disseminated to Herborn, the most important center of German Ramism, by Schöner, Herman Germberg, and Heinrich Crantz, who helped to introduce the teaching of Ramism at the newly founded Herborn *Paedagogium* or *gymnasium illustre* from 1584. Johannes Piscator, who had already taught Ramus's *Scholae* in Mörs, also contributed to setting up the program of the Herborn *Gymnasium Illustre*, which constituted a model for the foundation of those of Steinfurt (1591) and, by Matthias Martinus, of Bremen (1610). In Hanseatic cities, hosting simple *gymnasia* rather than academies, Ramism was also taken up because it fulfilled the need to teach a complete curriculum of studies in a short period of time; this was the case in the *gymnasia* of Danzig, Elbing, and Thorn in Prussia. As a consequence of its dissemination, Ramism assumed a confessional character. Even if it was rejected in major Reformed universities, with its introduction into schools Ramism served confessional aims: in Herborn, for instance, Ramism was part of the reform of the state based on Calvinist principles promoted by Johann VI of Nassau-

Dillenburg. Piscator, in his *Animadversiones in dialecticam Petri Rami* (1580), carried out such a confessionalization by illustrating Ramist method with religious examples; this led to an association of Ramism with Calvinism and to the subsequent rejection of Ramism in Lutheran states, as, for instance, in Leipzig from 1592.

The dissemination of Ramism in German areas was not only favored by the need to provide preuniversity schools with a curriculum, which was felt also by Vives, Sturm, and Melanchthon. Its acceptance was eased by the earlier spread of Agricola's dialectic from Louvain, where his *De inventione* was printed in 1515. It was then taught in Deventer by Alexander Hegius and at the cathedral school of Münster by Johannes Caesarius. Moreover, two editors of Agricola were active in Cologne: Bartholomeus Latomus – who, together with Johann Sturm, taught Agricola's dialectic in Paris – and Johannes Phrissemius. Agricola's dialectic also spread to Essen and Herborn via Marburg, where it was taught by Caspar Rudolphi. Finally, Sturm played the foremost role in the use of Agricola, providing a model for the reorganization of *gymnasia* in western Germany based on a sevenfold structure of teaching: this “stratified” structure favored the adoption of Agricola's simplified dialectic, and then of Ramus's. On the other hand, Ramism had a more limited impact in universities: Isaac Casaubon in Heidelberg and Joannes Caselius in Helmstedt opposed Ramism on the ground that it was necessary to teach philosophy by means of commentaries on Aristotle, and to include in the curriculum not only rhetoric and dialectic but the whole corpus of disciplines, whose contents were already available in scholastic textbooks. In Helmstedt, for instance, Cornelius Martini exhorted students in 1597 to cultivate the logic of Aristotle and Melanchthon rather than that of Ramus (Pozzo 2000, 2012). Yet, Ramism was gradually disseminated in universities as well. The transplantation of Ramism from *gymnasia* to *gymnasia illustria* and universities was made possible by its transformation into a methodology applicable to the higher arts of law, medicine, and theology, for which such institutions prepared students. This process is noticeable in Johannes Piscator's *Animadversiones*, where

Ramus's method is integrated with the logic of Melanchthon, giving rise to Philippo-Ramism or semi-Ramism. Also, in 1585 Piscator prescribed, in the *Leges Scholae Herbornensis* (Piscator 1585), learning Ramus's dialectic and Talon's rhetoric together with that of Melanchthon and of Aristotle himself. Such semi-Ramism spread to other academies modeled on that of Herborn, such as those in Steinfurt and Bremen; it is also observable in textbooks like that of Michael Sonleutner (*Institutiones dialecticae*, 1584), which aimed to find a *via media* between Melanchthon and Ramus. At the beginning of seventeenth century German Ramism was more and more integrated with alternative logical theories: this is the case of the *Systema logicum* (1600) and *Systema systematum* (1613) of Keckermann, professor at the University of Heidelberg, who integrated a Ramist explanation of disciplines – based on definitions and divisions – with Jacopo Zabarella's distinction between *ordo* and *methodus*. With his systematization, Keckermann paved the way to the ultimate outcome of Ramism in Germany: the *Encyclopaedia* of Alsted (1630), which is equally based on definitions, divisions, and dichotomies as means of exposition.

With its dissemination outside *gymnasia*, Ramism was thus applied not only to *trivium* but to the whole curriculum of the university. Scribonius published a Ramist natural philosophy in 1577 (Scribonius 1577), while Rudolph Snell (1594) and Freige (1585) lectured on the same subject in Marburg and Altdorf. Scribonius and Rudolph Goclenius then published Ramist texts in ethics in 1588 (Scribonius 1588) and 1592 (Goclenius 1592), while Johannes Althusius published his *Politica methodice digesta* in 1603 (Althusius 1603). At the University of Heidelberg Piscator subsequently applied Ramist method to the teaching of theology, providing a series of commentaries on the Bible from 1589 to 1597, while at the University of Basle Polanus von Polansdorf provided a systematic, Ramist theology in 1609 (Polanus Von Polansdorf 1609), and, Freige devoted his *Partitiones iuris utrisque* (1571) to the exposition of legal instructions in a Ramist way. Johannes Althusius, professor in Herborn, also published a Ramist exposition of

Roman law in Basle (1586) (on the use of Ramism in jurisprudence, see Oldrini 2001). In medicine Ramism had less diffusion, with Scribonius's *Idea medicinae secundum logicas leges*, published in Lemgo in 1584 (Scribonius 1584), the most notable example. The dissemination of Ramism in academies and, partially, in universities was moreover made possible by textbooks in which it was applied to metaphysics, such as those of Daniel Cramer, Nicolaus Taurellus, and the *Metaphysicae systema methodicum* of Clemens Timpler (1604) (Hotson 2007).

Outside Germany, Ramism had a consistent dissemination in Transylvania and Hungary: in 1629 Alsted and Ludwig Philipp Piscator (son of Johannes Piscator, and a Herborn Ramist himself), came to Alba Iulia – part of the Kingdom of Hungary – to establish an academy in 1629. In particular, Piscator introduced Ramist rhetoric into Hungary, where his *Rudimenta oratoriae* had five editions in 1630s and 1640s (Piscator 1649). Afterwards, Ramist dialectic was disseminated by Mihály Buzinkai, Istvan Tolnai, and Gyorgy Martonfalvi Toth, who provided commentaries on Ramus in the second half of seventeenth century (Kecske méti 2011). In Switzerland, Ramism was mainly taught in Basle. As well as Polandorf and Freige, Theodor Zwinger – a former student of Ramus in Paris – lectured in Basle on the ethics and politics of Aristotle by using the Ramist method of dichotomies, definitions, and divisions. Afterwards, Ramism in Basle was mainly represented by Ludwig Lutz, who provided an integration of Aristotle's and Ramus's logic (*Organum*, 1619). In Berne and Lausanne, Ramism was used in high schools, for example, by Markus Rüttimeyer and Jean-Rodolphe Le Fèvre (Rother 2001). In the Netherlands, before the breakthrough of Cartesianism, Rudolph Snell and his son Willebrord taught Ramus's dialectic and arithmetic at Leiden University. In Franeker, William Ames and Johannes Hachtingius were well-known Ramists. However, since scholastic philosophy was officially supported by orthodox theologians at the Synod of Dordrecht (1618–1619), Ramists never formed a consistent faction in Dutch universities. As in Germany, Ramism played a more consistent

role in the pre-academic course of the *trivium* at the Illustrious Schools – a form of higher education preparing students for the academic *quadrivium*. Yet Ramism was acknowledged as a full-blown school of logic by Franco Burgersdijk, who was entrusted by the States of Holland to provide a revision of Keckermann's *Systema logicum* and to make it more understandable to younger students. In his *Institutionum logicarum libri* (1626) Burgersdijk distinguishes between three schools of logic: the Aristotelian, which formed the basis of all logic; the Ramist, which had an overly narrow conception of logic; and Keckermann's logic, which combined Aristotelian and Ramist logic and dialectic.

As in Continental Europe, so, too, in England, Ramism was mainly taught as part of pre-university education, with hardly any presence in the curricula of universities themselves. Moreover, even at this level, it did not constitute a paradigm for teaching. As testified by the library catalogues of Cambridge scholars who owned Ramist texts, these do not make up a majority of their textbooks in logic, which included in most cases the *Organon* and the dialectic of Agricola and Sturm. Since in the sixteenth century pre-university education in England was often left to private teachers, Ramism could not be imposed by any central authority in education (Feingold 2001). Ramism was mainly embraced by Puritans, as it offered an efficient method of sermonizing and disputing. Under the influence of Laurence Chaderton, Ramism was received in Cambridge by Gabriel Harvey and George Downham, professors of rhetoric and logic at the Christ's College in 1570s and 1580s, and by William Temple, a fellow of King's College from 1576. Temple was the foremost exponent of Ramism in England: besides providing a commentary on Ramus's dialectic (1584), in 1580 he entered into a quarrel with Everard Digby, who attacked Ramus in his *De duplici methodo* (1580), to which Temple replied with his *Admonitio de unica Rami methodo* (1580). Temple, moreover, developed a Ramist ethics in his *Methodica adumbratio ethicae* (manuscript). In theology, Ramism was adopted by William Perkins, a fellow of Christ's College, Cambridge, who elaborated a method of

sermonizing based on Ramus's rhetoric (*The art of prophesying*, 1616–1618), and by Temple himself, who produced a Ramist analysis of the Psalms (*A logical analysis of twenty select Psalmes*, 1605). In Oxford, notorious Ramists included Laurence Humphrey (at Magdalen College) and Charles Butler. Ramism was also disseminated in London at the Inns of Court and in Church schools, by the teaching of Chaderton and Richard Hooker. Moreover, Temple spread Ramism to the grammar school of Lincoln, where he became a schoolmaster in 1581 (Mack 2004; Oldrini 1997, 227–308). Ramism also extended its influence through drama in the Elizabethan era: Christopher Marlowe portrayed Ramus's death in his play *The Massacre at Paris* (1592); moreover, Ramism appeared in plays written by students in the 1590s, ridiculing its use in the curriculum. A similar view appears in Marlowe's *Doctor Faustus* (1588) (Feingold 2001; Wilson 2011, Knight 2011). In Scotland, the foremost Ramist was Andrew Melville, whose reform of teaching served as the basis for the curriculum at the universities of St Andrews and Glasgow (re-founded in 1577), although the presence of Ramism is more discernible in the latter, because Melville was the only teacher of logic there, whereas at St Andrews, a bigger institution, the teaching was mainly based on Aristotle (Reid 2011). In Ireland, Ramism was taught in the *trivium* at Trinity College Dublin, where Temple was provost from 1609 to 1610 and reorganized the college (Boran 2001).

In Catholic countries, Ramism had less success, as it was officially banned by the Council of Trent in 1568. Before that date, Ramist rhetoric – which was more easily accepted than logic in universities – had an important dissemination in Spain, especially in Valencia, where Pedro Juan Núñez, a disciple of Ramus and Talon, wrote his *Institutiones oratoriae* on the basis of Talon's rhetoric (1552), followed in 1567 by Juan Lorenzo Palmireno's *Rhetorica* (Palmireno 1567) and in 1568 by Andrés Sempere's *Methodus oratoria* (Sempere 1568). After 1568 Ramist rhetoric was still taught in Valencia by means of *De arte dicendi* of Palmireno (1573) and the *Institutiones rhetoricae* of Núñez (1578). At the University of Alcalá de Henares, Benito Arias Montano taught his *Rhetoricorum*

libri (1569), while in Salamanca there was a partial acceptance of Ramus's dialectic, as testified to by Francisco Sanchez de las Brozas's *De auctoribus interpretandi* (1581), based on Talon's theory of elocution and on Ramus's dialectical disposition (Jiménez 2004). In Italy, Ramism was scarcely disseminated: the only traces of Ramism can be found in the unpublished *De numero et qualitate elementorum* of Antonio Persio, who was sympathetic to the ideas of Bernardino Telesio and who used Ramus's *Scholae physicae* against Aristotle.

Ramus, Petrus

Born: Cuts (village in northern France), circa 1515

Died: Paris, 26 August 1572

Véronique Montagne

CNRS, BCL, UMR 7320, 98 Bd Edouard Herriot, Université Nice Sophia Antipolis, Nice, France

Abstract

Petrus Ramus was a French logician and philosopher who was against scholastic logic and Aristotle. He is considered to be the precursor to Descartes.

Alternate Names

Ramée, Pierre de la

Biography and Works

Born in Cuts, Petrus Ramus moved to Paris at the age of 11. In 1527, he attended the Collège Sainte-Barbe and Collège de Navarre, where he served a rich student, Sieur de La Brosse. There, he met the future Charles of Lorraine and discovered Aristotle with Jean Hennuyer, who later became Bishop of Lisieux (Normandy, France). He attended the lectures of humanist educator Johannes Sturm, German humanist Bartholomew Latomus, and Jacques Omphalius, who was later appointed imperial advisor. The courses were based on Rodolphus Agricola's *De inventione dialectica* (1515), which describes the characteristics of a discourse based on probability. At the age of 21, Ramus argued in his master's thesis that Aristotle's doctrines were false ("*quaecumque ab Aristotele dicta essent commentitia esse*"), which shocked and embarrassed his jury, who were accustomed to relying on the authority of the Greek philosopher.

Having obtained his master's degree, Ramus started teaching in 1537 at the Collège du Mans in Paris, and then at the Collège de l'Ave Maria in Le Mans (France), where he advocated for the combined study of philosophy and eloquence: orators and poets were featured in this popular course, which was inspired by Johannes Sturm. He met French humanist Omer Talon and Barthélémy Alexandre, a Hellenist eager to disseminate Greek texts in their original language. The three men became friends and taught courses open to the public, which were based on the works of Greek and Latin authors. Throughout his life, Ramus continued to support the study of Greek alongside Latin.

In 1543, Ramus published his first two works on logic and dialectic: *Dialecticae partitiones ad Academiam Parisienem* (1543a) – he gave a copy to Francis I, likely in the hopes of becoming one of his protégés – and *Aristotelicae Animadversiones* (1543b), dedicated to Charles

of Lorraine, in which he attacks Aristotle's logic more specifically and, indirectly, the masters of the Faculté des arts in Paris who taught Aristotle's works. Ramus explains for the first time his idea of one universally applicable method (contrary to Aristotle who makes a distinction between the apodictic and dialectic methods), which "consists of proceeding from the whole towards the parts by defining, dividing, giving examples" (Bruyère, 1984: 76). These works caused outrage and angered people such as Joachim Périon (doctor from the Sorbonne), Antoine de Gouvéa (Goveanus, a Portuguese legal advisor), and the regents of the Université de Paris. Ramus was therefore prosecuted. His *Aristotelicae Animadversiones* was presented to the Faculty of Theology, which banned the work. Members of the faculty wanted to defend teaching theology using Aristotelian physics and metaphysics, combining (human) philosophy and theology. In 1544, Ramus's works were banned by decree of King Francis I, who forbade him from teaching philosophy. Omer Talon took over his position, defending Ramus in his work on rhetoric published in January 1545 (*Institutiones orotoriae*). Ramus began teaching eloquence and mathematics and was the first to translate Euclid into Latin (1545). That same year, while Paris was affected by another episode of the plague, he became the head of the Collège de Presles (one of the colleges of the Université de Paris).

In 1547, Francis I died: Charles of Lorraine (now Cardinal of Guise) asked Henri II to annul the decree of 1544. Under Henri II, Ramus was given more leeway and could devote himself to writing, leading to a new edition of *Aristotelicae Animadversiones*, toning down the virulence that had been so controversial. He also published *Brutinae quaestiones in Oratorem Ciceronis* (1549b) and *Rhetoricae distinctiones in Quintilianum* (1549c), in which he criticizes Cicero and Quintilian. He once again incurred the wrath of Joachim Périon, as well as Jacques Charpentier, professor of philosophy at the Collège de Boncour. Pierre Galland – who was appointed professor of Latin eloquence from 1542 to 1543 by Francis I – revived Ramus's edition of Quintilian. In 1548, Omer Talon

published *Rhetorica ad Carolum Lotharingum*, based on Ramus's criticism of Cicero and Quintilian; the work was then translated by Antoine Fouquelin in 1555 (*La Rhétorique française*) with several terminological changes and examples from French literature instead of Virgil.

Thanks to Henri II, Ramus obtained the post of "royal professor of eloquence and philosophy" in August 1551, a new position that he alone would occupy. He championed the union between rhetoric and dialectic, the former being strictly subordinate to the latter. The principles of this "conjunction" are laid out in *Oratio de studiis philosophiae et eloquentiae conjungendis* (1549a), which states that doing well and speaking well go hand in hand. Ramus started teaching classes at the Collège de Presles that were extremely popular, combining once again the works of poets and orators with philosophical texts. There, he met Nicolas de Nancel, who became his student and secretary, and published his biography in 1599 (Nancel 1599).

In 1551, Ramus proposed a reform in Latin pronunciation, particularly concerning the "q." His interest in grammar led him to publish a Latin grammar manual in 1559, a Greek one in 1560, and a French one in 1562 (revised and reissued in 1572). He is best known for advocating for the distinction between "j" and "i" and "v" and "u" in French spelling. During this period, he continued pursuing his work on rhetoric and attacked Cicero and Quintilian in a collection of texts later published under the title *Scholae rhetoricae*. His *Institutiones dialecticae* (1554) and *Dialectique* (1555) focus on dialectic; he leaves *elocutio* and *actio* to his friend and colleague Omer Talon, looking instead at *inventio* and *dispositio*, as applied to dialectic (the art of reasoning methodically). While Rodolphus Agricola proposed an interpersonal conception of dialectic in *De inventione dialectica*, Ramus advocated a monological method, foreshadowing the work of Descartes a century later. While Agricola considers persuasion to be the aim of dialectic, Ramus believes dialectic seeks truth, and he considers the Aristotelian distinction between logic (the art of the real) and dialectic (the art of the probable) to be pointless. The

"precautionary approach" mentioned in his text – which cannot be applied to "assured" dispositions – completes the ideal and apodictic "method of nature"; however, it demonstrates that eliminating subjectivity, rhetoric and passion might not be feasible in all circumstances. Dividing rhetoric in two fields – dialectic (logic), which deals with *inventio* and *dispositio*, and rhetoric, with *elocutio* and *actio* – contributes to the "widespread restriction" of rhetoric.

With the support of Henri II, in 1557, Ramus was appointed to a commission that was given the task of proposing reforms for the Université de Paris. This reflection led to *Advertissemens sur la reformation de l'université de Paris* in 1562a, which criticizes and considers the consequences of having an unlimited number of professors, namely, the excessive cost of education. A protégé of Francis II and Charles IX, Ramus very effectively defended the privileges enjoyed by the Université.

Ramus was a devout Catholic up until 1561. However, the union between Aristotle and the Church – common since the beginning of the sixteenth century – meant that anyone who did not adhere completely to Aristotle's philosophical opinions was considered to be a heretic, and Ramus was no exception. Alienated from the Catholic Church and attracted to reformed Christianity, which counted among its ranks some of the greatest scholars and scientists of the century, Ramus converted to Protestantism at the Poissy conference in 1561. As a consequence, he lost the protection of Charles de Lorraine (Cardinal of Lorraine since 1550). His conversion renewed his desire to confront theological texts with the precepts of dialectic. In 1562, the French Wars of Religion broke out with the Massacre of Vassy; Ramus moved to Fontainebleau but failed to escape prosecution. He returned to Paris in 1563, following the signing of the Edict of Amboise, and resumed teaching grammar, rhetoric, and logic. In 1566, Jacques Charpentier and Ramus clashed once again; having taken an interest in mathematics since 1545, Ramus contested Charpentier's legitimacy as the recently appointed professor of mathematics at the Collège Royal. From 1568 to 1570, he traveled to Germany –

where he spent time with Johannes Sturm – and Switzerland, before his assassination in 1572, 2 days after the St. Bartholomew's Day massacre in Paris.

Abstract

Cesare Rao, an Italian philosopher and writer from Alessano, in the Otranto area, was born in 1532. We know for sure that the philosopher was awarded an Arts degree by the University of Bologna on 10 September 1556. He returned to his hometown after 1573, where he lived until his death, most probably in 1588. Rao's works are representative of some important

phenomena that were occurring in the second half of the sixteenth century. The first was the vernacular translation of the scientific doctrines of Aristotle, particularly the medieval and Renaissance Peripatetic meteorological tradition. The second phenomenon in which Rao participated was the creation of an Italian philosophical lexicon.

Biography

Cesare Rao, an Italian philosopher and writer from Alessano, in the Otranto area, was born in 1532. His writings include *Sollazzevol convito* (1562a), a text in which he addresses the usual themes of Ficinian Neoplatonism and the “philosophy of love”; *L’Argute e facete lettere* (1562b), a literary work that enjoyed considerable and lasting publishing success; a paper entitled *De eloquentiae laudibus* (1577a); two physico-meteorological works, *Dell’origine de’ Monti* (1577b) and *Meteori* (1581–1582); and *Invettive, orationi et discorsi* (1587) (Vacca 1948).

He left his parent’s home at the age of 18, when he decided to study at the University of Naples. A year later, he set off for Pisa, partly attracted by the fame of the renowned Aristotelian professor, Simone Porzio. Rao completed the second year of his studies in Pisa, but, due to an ongoing war in the area, he was forced to move to Pavia in 1553. It was most probably in this city that he began to write his first works. After some time, he returned to Alessano, where he spent a few years from between 1553 and 1560. We know for sure that the philosopher was awarded an Arts degree by the University of Bologna on 10 September 1556. Some of his letters from Rome, Florence, Genoa, Bologna, Milan, Pavia, Ferrara, and Mantua cannot be accurately dated, but were certainly written before 1562. He was in Lucca for a short period in 1562 and in Venice the following year. We have no information about Rao’s place of residence for the following decade. In 1573, the philosopher was living in Pavia, where he was probably a member of the Academy of Illustrators, to which he read or arranged a reading of his *Orazione in lode della Filosofia*. He finally returned to his

hometown after 1573, where he lived until his death, most probably in 1588 (Vacca 1948; Papuli 1967; Figorilli 2004).

Heritage and Rupture with the Tradition

Rao’s experience was deeply influenced by his university education, which contributed to his brilliant activity as a writer in the Italian language. He dedicated two important works in Italian to questions of physics: *Dell’Origine de’ Monti* and *Meteori*, in which he interestingly adopts an “eclectic” approach to the Aristotelian physical tradition, revealing the influence of various traditions of thought. With regard to meteorology, for example, he uses a combination of elements from the tradition of Aristotelian *Meteorologica*, together with others from the al-Kindi Arab tradition of (astrological) meteorology. It should be borne in mind, however, that Italian Arts and Medicine curricula at the time (even in Bologna, where Rao studied for his master’s degree) included a highly conspicuous selection of texts from the medieval Arabic tradition (Verardi 2012a, 2012b, 2013, 2014a, b).

Innovative and Original Aspect

Rao’s works are representative of some important phenomena that were occurring in the second half of the sixteenth century. The first was the vernacular translation of the scientific doctrines of Aristotle, particularly the medieval and Renaissance Peripatetic meteorological tradition (Bianchi 2009; Sgarbi 2014). The second phenomenon in which Rao participated was the creation of an Italian philosophical lexicon. He considered this “effort” comparable to Cicero’s work of translating Greek knowledge into Latin. Through the creation of an Italian philosophical lexicon, Rao intended to explain to a broader public the rational causes of extraordinary phenomena, which were mistakenly regarded as supernatural by the “uncouth.” Thus the translation of science into the vernacular assumed a specific social role in the struggle against superstition (Vianello 1988; Verardi 2014a).

Impact and Legacy

The result is a view of the philosopher's activity as a radical struggle against every form of superstition, pursued not in the narrow confines of the university, but in the living fabric of society, under the banner of a new Italian philosophical language (Verardi 2013, 2014a, b).

Rarefaction and Condensation

Xiaona Wang

University of Edinburgh, Edinburgh, UK

Abstract

Rarefactions and condensations, in their simplest form, are those phenomena in which material substances vary in their densities, becoming more fine or tenuous on the one hand or coarser or thicker on the other. Although they might seem unproblematic concepts to modern readers, in fact they have a complex history and even have been seen as fundamental aspects of nature. For a number of thinkers, the phenomena of rarefactions and condensations seemed to suggest, inescapably, that matter must have inbuilt principles of activity. Essentially, this boils down to a belief that matter can determine its own dimensions in some way – either by spreading itself out, or contracting itself inwards, or, in the case of corpuscular theories, by moving its constituent particles closer together or further apart. And this kind of self-determination or self-movement was, for these thinkers, either occult or fundamental and unexplained. It is a sign of the complexity of the issues arising from condensation and rarefaction that alternative, non-occult, attempts to explain these phenomena never achieved full consensus. The most

influential account was eventually provided by Isaac Newton by supposing attractive and repulsive forces capable of acting at a distance between atomic particles. But even this was superseded by the non-occult kinetic theory of gases in the late nineteenth century.

Introduction

Rarefactions and condensations, in their simplest form, are those phenomena in which material substances vary in their densities, becoming more fine or tenuous on the one hand or coarser or thicker on the other. Although they might seem unproblematic concepts to modern readers, in fact they have a complex history and even have been seen as fundamental aspects of nature. For a number of thinkers, the phenomena of rarefactions and condensations seemed to suggest, inescapably, that matter must have inbuilt principles of activity. Essentially, this boils down to a belief that matter can determine its own dimensions in some way – either by spreading itself out, or contracting itself inwards, or, in the case of corpuscular theories, by moving its constituent particles closer together or further apart. And this kind of self-determination or self-movement was, for these thinkers, either occult or fundamental and unexplained. It is a sign of the complexity of the issues arising from condensation and rarefaction that alternative, non-occult, attempts to explain these phenomena never achieved full consensus.

Heritage and Rupture with the Tradition

The importance of the concepts of condensation and rarefaction can be seen from the fact that one of the earliest of the Pre-Socratic natural philosophers, Anaximenes of Miletus (BC. 585–528), considered them as fundamental to physics and ultimately responsible for all physical change. Seeking to reduce the complexity of the material world to one fundamental substance, Anaximenes fixed on air as the “originative substance and basic form of matter,” but it was only through condensation that air could manifest itself as liquid or

solid and only through rarefaction that it could return again to air or by further rarefaction manifest itself as fire. What is not clear is how these changes of state were brought about. He simply seems to suggest that air can condense or rarefy of its own accord, as though it works by its own power, an explanation which might be characterized as occult. The fundamental nature of condensation and rarefaction for Anaximenes can be seen in the fact that he explained other phenomena in terms of them. Noting that steam is hotter than water, and that fire is hotter than air, Anaximenes suggested that rarefaction resulted in the generation of heat. Similarly, the coldness of ice suggested that condensation from water to ice (the fact that ice is less dense than water was unknown to the Ancients) generated cold (Kirk 1983). One of the ways in which Aristotle subsequently rejected Anaximenes’ occult account was to insist that condensation and rarefaction were passive reactions of matter to what Aristotle saw as the “manifest” qualities of heat and cold (although some Renaissance writers, Jean Fernel, Bernardino Telesio, Daniel Sennert, and others, would later point out that heat and cold were no more manifest than any occult quality). The example of Anaximenes, anyway, reveals that right from the outset of natural philosophy, condensation and rarefaction were recognized to be problematic and defied easy explanation.

Approximately one and a half centuries after Anaximenes, the ancient atomistic explanation of rarity and density was equally problematic. Democritus and Leucippus explained rarefactions and condensations in terms of atoms either receding from (rarefaction) or approaching toward (condensation) one another. The ancient atomists never actually gave any further explanation as to how atoms could recede from or approach toward each other in this did they suggest how atoms in a highly rarefied substance should stand apart from one another for indefinite periods of time; what prevented particles of air from collapsing together and so condensing into water or ice?

Aristotle pointed out that the atomist position rested on the assumption that the atoms of any substance were initially at some arbitrary distance

from one another and hence depended upon the existence of what Aristotle called “self-determined voids.” In the atomist theory, as it were, gold (the densest substance) might be assumed to have particles which are touching one another but that air (composed of atoms of the same matter as gold) can only be so much lighter than gold by having its atoms intermingled with a greater amount of void. The implication follows that air particles can somehow hold themselves apart in void space.

Aristotle, always keen to resolve problems by carefully chosen definitions, therefore defined condensation and rarefaction in terms of the amount of matter in a given volume. A dense body had more matter in the same volume than a rare body. But the problem arises: how can more matter be put into a volume without the matter interpenetrating the matter already there (it seems to go against the dictum that two bodies cannot occupy the same space at the same time)? Similarly, if a certain amount of matter is taken out of a previously full volume, how can the remaining matter fill that same volume? In short, Aristotle’s account was essentially unintelligible – it might seem unproblematic as a definition, but it was not easy to see how the definition could be translated into actual physical terms. As Thomas Hobbes later suggested, Aristotle’s definition depends upon illegitimately separating body from quantity, as though a body may have more quantity at one time and less at another time; but a body does not *have* a quantity that can be varied in this way, a body *is* a quantity.

The historical success of Aristotle’s attempt to define the problem out of existence probably owes much to the fact that the atomist account seemed to depend upon action at a distance. If rarity consisted in the atoms of a body standing apart from one another, there must be some repulsive force operating between them to keep them apart. Even the later Epicurean atomists (at least as represented by Lucretius) fudged this issue. Lucretius seems to imply that rarity can be explained by a body having “more vacuum in it,” and yet he explicitly denies actions at a distance and elsewhere implies that air flows in to fill the space between bodies and to keep those bodies

apart. This was one of the most intractable problems of atomist philosophy; it was not to be solved until Newton simply supposed, on what he regarded as unassailable empirical grounds, the existence of repulsive forces capable of operating at a distance between the particles (Henry 2011). The fact that the ancient atomists did not properly address this point strongly suggests that their concern was less to do with the niceties of the problem of rarefaction and condensation but more to do with establishing the existence of void space as a matter of principle. There was a classical experiment that atomists presented as evidence supporting the existence of micro-vacua: a vessel filled with loose ashes could be shown to hold as much water as the vessel did when it was empty. Although the atomists tried to use this to confirm the existence of empty space between the particles of ash, their opponents simply claimed that there was air between the particles of ash and the water displaced the air – furthermore this was close to the same amount of water that could be poured into the vessel when it was empty (Michael 2008). The obvious inadequacy of this experiment for demonstrating the existence of void space strongly suggests the atomists themselves did not want to develop alternative scenarios in which they might be revealed as subscribing to actions at a distance.

Even so, atomist arguments did occasionally appear throughout the Middle Ages in critiques of Aristotelianism. One of the most famous and influential medieval atomists was Nicholas of Autrecourt in the fourteenth century, whose treatise *De vacuo* is one of the best-known works against the Aristotelian notion that a void was impossible. Nicholas explains atomic movements in terms of the motion of an atom through different places and then uses such movements to give an account of the phenomena of condensation and rarefaction in terms of the quantitative changing of bodies, by the local movement of atoms within the body. But again, he prefers to remain silent about how the spacing out of the atoms is maintained, rather than facing the problem head-on (Grellard 2008).

Nicholas’s contemporary William Crathorn took a roughly similar line in understanding

rarefaction and condensation. Crathorn insisted that there are only two feasible ways of interpreting condensation and rarefaction: either as the result of some kind of alteration or as the result of a change in the positioning of atoms that exists due to vacuum – empty spaces filled in some other way or new empty spaces in a body causing an increase in size (Robert 2008). Again, there was no real attempt to address the Aristotelian objection to the existence of “self-determined voids.”

Innovative and Original Aspects

In view of this long history, it is hardly surprising that the problematic nature of the atomist account of condensation and rarefaction came to the fore again in the sixteenth and seventeenth century with the revival of atomist (or corpuscularian) natural philosophies. The Renaissance period can be seen as a period of revival of natural magical traditions and of increased recourse to occult traditions as an alternative to what was frequently perceived to be the moribund scholasticism of the Middle Ages. The revival of ancient atomism initially went hand in hand with this increasingly occult natural philosophy, but the beginning of the seventeenth century saw the emergence of a radically anti-occult version of corpuscular philosophy, the so-called mechanical philosophy, in which the emphasis was upon “matter in motion,” rather than “atoms and the void.” Clearly, self-determined voids and self-moving particles were as much a problem for the mechanical philosophies as they had been for scholastic Aristotelianism (Henry 1986, Palmerino 2011).

However, even the most ingenious and philosophically astute of the new mechanical philosophers, René Descartes, failed to deal in a satisfactory way with the phenomena of rarefaction and condensation. “Rarefied bodies,” he suggested, “are those which have many gaps between their parts – gaps which are occupied by other bodies; and they become denser simply in virtue of the parts coming together and reducing or completely closing the gaps.” Implicit in this

suggestion is the assumption that the bodies occupying the spaces between the particles of the supposed rarified body are somehow less dense than the rarefied body (otherwise, the rarefied would not become denser as its parts came closer together and excluded those intruding bodies). This immediately raises the question as to how their lesser density is explained – any attempt to suggest it is due to there being many gaps between their parts leads to an infinite regress, and so Descartes has to assume these bodies simply are less dense – which begs the question. By providing the example of a sponge, Cartesian philosophy shows its clumsiness in terms of the explanation of rare and dense. Descartes considers that rarefaction takes place when a squeezed sponge is released and the holes in its structure spring back open, but the holes are immediately filled with air or the subtle matter which Descartes invokes in order to fill in the gaps between larger particles. He then argues that this is “the only intelligible way of explaining rarefaction.” Descartes did not allow void space, and so he cannot consider voids as another intelligible way of explaining rarefaction, but his own explanation is by no means as intelligible as he professes. Given that matter is defined solely in terms of extension, we have no grounds to assume that one piece of extended matter is any more or less dense than any other part – so the particles filling the holes in the sponge must be as dense as the sponge itself, so there can be no difference in density between a squeezed sponge and a released sponge. Although Descartes seems to have been completely unaware of his error, the fact that he begged the question about the causes of rare and dense in this way surely indicates that ancient atomism provided the model for his account and that rarefaction involved “more vacuum” between the particles. Clearly, Descartes could not allow “more vacuum” between particles, so he unthinkingly substituted “more rare particles” between particles.

Pierre Gassendi did not fall into the same solecism. Gassendi was never fully convinced by Cartesian mechanical philosophy and always allowed for occult elements or active principles within his natural philosophy. Even so, his adaptation of

Epicurean atomism meant that he inescapably confronted the same difficulty as his atomist predecessors (Osler 1994, Fisher 2005). In *Syntagma philosophicum*, Gassendi cited a number of chemical phenomena as examples – the saturation of water with salt, the dissemination of dyes through water, and the penetration of air and water by light, heat, and cold (all of which he assumed to be corpuscular). Noting that water saturated with some salt was still as competent in dissolving alum as stainless water would have been, he therefore made the conclusion that there must be miscellaneous variously shaped micro-vacua in the water, each type of which receives exactly one type of corpuscles. From this, he simply confirmed his point that interstitial voids are an undeniable aspect of the atomic theory of matter. It is important to note, however, that the picture he presents is one of atoms touching one another in such a way that they define differently shaped interstitial void spaces. So, atoms might form a lattice with square-shaped holes, between them, or star-shaped holes, and so on. Each of these holes can be filled (e.g., in chemical reactions) by other appropriately shaped particles. Gassendi's voids are not self-determined but are determined by the geometry of the particles themselves and the way they are stacked and so forth. In this way, Gassendi avoids any suggestion that atoms stand apart from one another in the void – they are touching one another. This schema only allows for very limited rarefactions and condensations – we can imagine particles stacked with square holes between them being compressed so that the particles end up with smaller triangular holes between them. The effect would be that the body made up by these particles would be denser after compression. It is impossible to second-guess how Gassendi might have dealt with cases of extreme rarefaction, however, as revealed in experiments using the newly invented air pump later in the century.

Another leading mechanical philosopher, Thomas Hobbes, was evidently so baffled by rarefaction and condensation that he even went so far as to deny their existence. For Hobbes, the action of a so-called wind-gun, or air gun, which was generally assumed to depend upon compressed

air, simply derived from the motion of air. The pumping process to charge the gun did not compress the air in its cylinder, according to Hobbes, but merely put the air in the cylinder into violent motion. It was the violent motion of the air, not some imagined compression (which for Hobbes was an incoherent concept), which forced the bullet out of the gun. Similarly, effects in the chamber of the air pump which were generally attributed to extreme rarefaction of the air were said by Hobbes to be caused by violent motions of the air generated by pumping. Given the invisibility of the air, it was impossible to say whether a candle in the air pump was extinguished by lack of air or by a strong gust of air (or so Hobbes insisted). Hobbes's critics, however, were not slow to point out that the same substance could be made to vary in density – something which Hobbes was committed to denying (Schaffer 1998).

Not everyone was a corpuscularist philosopher. The problematic nature of condensation and rarefaction was also noticed by Francis Bacon, who had conducted a series of careful experiments to establish the relative densities of different substances (Manzo 2016). Accordingly, the concepts of condensation and rarefaction played important roles in Bacon's *Novum Organum*. Bacon, one of the latest thinkers in the Renaissance revival of magic, thought of rare and dense in terms of occult principles. Bacon considered that matter itself has the inherent tendency to expand and contract, by “folding and unfolding itself in space,” “within certain limits, without the interposition of a vacuum”; thus rarefaction and condensation were due to matter's own power. This view of matter, on the other hand, was also conceived as having a close relationship with motion. Bacon held a differential vitalistic theory, to explain rarefaction and condensation, as well as motion – he held to the view that bodies had a natural state which they wanted to maintain, and so a body subject to compression would restore itself upon release, and similarly, a rarefied body would gather itself back together as soon as possible to regain its natural state.

In spite of its non-corpuscularian nature, Bacon's theory was influential upon the English

lawyer, and dilettante natural philosopher, Matthew Hale (1609–1676). Hale also saw rarefaction and condensation as the result of an “internal immediate principle of motion,” namely, *vis activa*. It should be noted that Hale was writing in the 1670s much later than Bacon, when the Cartesian strict version of the mechanical philosophy was highly prominent in Europe. As an English natural philosopher, Hale developed the view of active qualities here not only as an answer to the causes of rarefactions and condensations but also the causes of motion, thereby rejecting the Cartesian account of completely passive matter in inertial motion. Although Hale’s work attracted critical responses from Henry More and Robert Boyle, it and Bacon’s account served to show not only that the Cartesian account was inadequate but also that no earlier philosopher had ever given a satisfactory account of it.

The inadequacy of previous accounts was noticed by Isaac Newton finally. In a letter to Boyle, written early in 1679, he tried to develop a theory of an ether which was rarer and more active than air. Evidently dissatisfied with these preliminary speculations, he wrote an essay “On the air and the aether” (*De aere et aethere*) in which he considered what it meant to say that air was much rarer than other bodies and that an ether could be much rarer than air. As an atomist, Newton assumed that rarefaction was due to particles being spread further apart (or separated by more void). Even with rough and ready calculations, Newton knew that air could be expanded to “a hundred or even a thousand times its normal space, which would hardly seem to be possible if the particles of air were in mutual contact.” Accordingly, Newton assumed there must be “some principle acting at a distance” between the particles to keep them apart. The only problem with this account of rarefaction and condensation was that it depended upon actions at a distance, which had hitherto tended to be seen as untenable. But Newton’s *Principia Mathematica* (1687) was about to make actions at a distance an accepted part of physics, with the universal principle of gravitation, and so Newton’s account of rarefaction and condensation became authoritative. In the Preface to his *Principia*, Newton wrote of his

suspicion that all phenomena may depend, not only upon attractions but also on repulsions between particles (Henry 2011). If the attractive forces accounted for gravity, cohesion, and condensation, the repulsive forces accounted for change of state and rarefaction. Once again, as with Anaximenes, rarefaction and condensation came to be seen as fundamental aspects of physics.

Reason of State, Renaissance Concept of

Simone Testa

International Studies Institute, Florence, Italy

Abstract

The article explains the meaning of the concept “reason of state” and charts its development between the sixteenth and the seventeenth century. Scholars have traditionally concentrated on the debate raised by Machiavelli’s acceptance of the necessity of evil and the Christian response to Machiavelli put forward by Giovanni Botero. This entry also considers the use of the concept in texts directly connected to diplomatic experience, where “reason of state” does not appear as tainted with unethical meaning. Moreover, the entry establishes direct connections between the concept of “reason of state” and those of “political prudence” and “interest of state.” Following transformation of the concept of “interest,” this became the ethical alternative to “reason of state.”

Synonyms

Interest of state; Political prudence; Things of state

Definition and Early Use of the Concept

The experience of political affairs forms the basis of “reason of state,” in that this concept adapts to specific circumstances, but the principles of “reason of state” were first clearly formulated in early modern Europe, though without providing a definition of the theory.

Although the concept existed in Classical Antiquity and the Middle Ages (Post 1964; De Mattei 1979; Burke 1991), the expression “reason of state” (Lat. *ratio status*, It. *ragion di Stato*, Ger. *Staaträson*, Fr. *raison d’état*, Sp. *razon de estado*) was not used until the sixteenth century. Initially the expression ‘reason of state’ did not provide a definition of the concept: Francesco Guicciardini first refers to “ragioni degli stati” (“reasons of the states”) in his *Dialogo del reggimento di Firenze* (*Dialogue on the Government of Florence*, 1521–1525).

The action taken according to the principles of “reason of state” sacrifices commonly accepted juridical, economic, moral, and political principles in order to guarantee the security of the state. It is prescriptive, following the analogy of a physician, who prescribes a specific remedy for a specific illness, according to the specific characteristics of the sick individual. This process reflects the relativistic approach of the principles of “reason of state” and includes the preparatory process of information gathering to pave the way for subsequent action.

“Reason of state” can be a set of norms, in that it indicates what to do to achieve the state security; it can also be descriptive, in that it explains rulers’ actions in specific circumstances and how such actions meet the principles of “reason of state” (Pistone 2004). It applies both to internal relations between a ruler and his subjects and to international relations between rulers. The practical implications of the doctrine affect the relationships between states all over the world and focus on the difficult relationship between morality and politics.

In the second half of the sixteenth century, the expression “reason of state” was associated with those of “political prudence” and “interest of state” (Baldini 1999). More recently, the concept

of “reason of state” has been considered a symptom of modernity (Meinecke 1998 [1924]), as it stresses the importance of individual states, their specific interests, and individual circumstances. For other scholars, “reason of state” was a concept that emphasized the role of expediency to maintain power, at the expense of the discourse about justice and legitimacy that characterized medieval communes (Viroli 1992). In this entry, we shall follow the use of the expression “reason of state,” “political prudence,” and “interest of state” through selected sixteenth and seventeenth century authors.

Although he never used the expression, the origin of the concept of “reason of state” is usually ascribed to Machiavelli’s political writings. In *Il principe* (*The Prince*, XVIII) he wrote: “A ruler . . . cannot always act in ways that are considered good because, in order to maintain his power, he is often forced to act treacherously, ruthlessly, or inhumanely, and disregard the precepts of religion. . . . and, as I said before, not deviate from right conduct if possible, but be capable of entering upon the path of wrongdoing when this becomes necessary” (Machiavelli 1988). Also, Machiavelli’s expression “things of state” (Descendre 2014) indicates an action taken against commonly accepted moral conduct; in *Discorsi sopra la prima decade di Tito Livio* (*Discourses*, III, 40), the Florentine secretary declared that it is acceptable “to use fraud against an enemy who does not trust in you” (Machiavelli 1996) or that it is acceptable to kill prisoners instead of compromising, which is always detrimental in matters of state. Thus, “things of state” suggests that states’ matters normally refer to international relations. With this perspective in mind, killing all the prisoners during a war is acceptable according to “things of state,” and similarly (in *Discorsi* III, 40, 41, and 42) Machiavelli justifies any action to save the fatherland, including breaking agreements that have been imposed and not chosen freely.

The first use of the expression “reason of state” occurs in Francesco Guicciardini’s *Dialogue* (pp. 158–159), as “reasons of the states” (“ragioni degli stati”). Guicciardini shows he is aware of the moral implications of this action, when he goes on to state that “anyone who wants to live totally

according to God’s will can ill afford not to remove himself totally from the affairs of this world, and it is difficult to live in the world without offending God” (Guicciardini 1994, 159). In this instance the action taken, though contrary to commonly accepted moral practice, is nevertheless necessary for maintaining power. Guicciardini’s studies and early practice as a jurist may have played a part in the use of “reason,” which here has a practical, rather than theoretical, meaning.

By contrast, in his *Orazione* (1547 [1960], 479–480), Giovanni della Casa’s reference to “reason of state” is clearly negative, given that he contrasts it with “civil reason.” Thus, he opposes altogether the idea that it is acceptable to act against commonly shared moral principles in state-related matters. This same negative accent on “reason of state” persisted in late sixteenth-century theorists, and in particular in the seventeenth-century language of politics, including Cesare Ripa’s iconographic representation of “reason of state” (Croce 1925; Borrelli 1994; Bondi 2017).

A Diplomatic Approach to the Concept

A vision of “reason of state” inspired by practice and with a direct reference to both internal affairs and international relations appears in the publication plan entitled *Somma delle opere che ha da mandar in luce l’Academia veneta* (*Works to be published by the Venetian Academy*, 1558), issued by the diplomat Federico Badoer’s *Academia della Fama* (Testa 2015). The section of the plan dedicated to politics sought to describe the political interests of European powers: *Cinque libri di ragion di stato, ne’ quali con maraviglioso ordine si contengono tutte quelle cose, che sono necessarie, e che ragionevolmente si possono sapere, dintorno alle persone, alle corti, a paesi, et a gli habitanti, et alle forze de’ Principi, si Christiani, come infedeli, delle rep[ubbliche] et d’ogni altro governo* (*Five books about reason of state, wherein are contained, in wonderful order, all details that are necessary and that can be known about people, courts, countries, inhabitants, and forces of princes, either Christian or*

infidel, of republics and of any other form of government). Although we do not know what exactly these five books were meant to contain (the editorial programme related to politics was fulfilled only partially), the use of the expression “reason of state” in this context is important because the rest of the Academy’s wish list related to politics suggests a nonmoral approach to describing individual states and their political interests. The other books in the political wish list were supposed to discuss states’ finances, rights of precedence, privileges, and agreements between states. This plan gave way to a genre in itself often identified with that of “reason of state,” that is, *arcana imperii*, or secrets of states, and was to find in the anthology *Thesoro politico* (1589) one of its best vehicles.

The Debate on the Morality of the Concept

The generation of political writers after Machiavelli felt uneasy about the justification *tout court* of the necessity to do evil in order to achieve a better outcome for the state and attempted to reformulate Machiavelli’s uncompromising opinion. Scipione di Castro’s treatise *Delli fondamenti dello stato et instrumenti del regnare* (translated as *The instruction of a Prince*), conceived in the 1570s and published for the first time in *Thesoro politico* 1589, is emblematic (Testa 2012). In a manuscript that was rewritten several times, Di Castro distinguished between two reasons of state. One is a legal reason (*ragione legale*), which is preferable: it usually delivers better results and makes people happier. Another is a “reason of state” that responds to a kind of justice that rulers have made up for their own benefit and that normally satisfies what is useful rather than what is honest. In another passage, Di Castro accepts the necessity of the action taken against the normally accepted moral norms; he also defines “reason of state” as a reasonable and necessary force that compels the prince to sacrifice what is honest for what is useful. In the final version of the treatise, Di Castro conceded that even the rightful prince might have to sacrifice honesty to utility out of the care that he necessarily

must bear for the whole state, acting as a sort of physician who prescribes a medicine to a sick body.

It is commonly accepted that the Jesuit Giovanni Botero’s *Della ragion di stato libri dieci* (*Reason of State*, 1589) sparked off the discussion on the meaning of “reason of state” and on whether or not it was possible to rule a state without acting against commonly accepted moral principles. Botero’s intention was to define a “reason of state” that should be distinguished from the political action inspired only by necessity, as Machiavelli had proposed. However, Botero’s definition of “reason of state” led to harsh criticism, as it seemed to contradict itself. While some scholars have recently affirmed that Botero was coherent in his purpose, others argued that Botero devised a new consistent idea of politics based on the principle of conservation (Bireley 1990; Borrelli 1993; Descendre 2009) rather than on enlargement. In this context scholars have noticed that in the eyes of the seventeenth-century writers, “political prudence” became a synonym for “reason of state” to be applied case by case and to be distinguished from its immoral counterpart, that is, shrewdness.

The Concept of Political Prudence

Both “reason of state” and its correspondent “political prudence” undermine the Aristotelian notion of prudence (*Nicomachean Ethics*, VI, 1140a–1144b), on the basis of a misunderstanding (Battista 1966; De Mattei 1982–1984). Between the fifteenth- and sixteenth-century, political writers identified prudence (or *phronesis*, in Italian *prudenza*) with “politics” (De Mattei 1951; Battista 1966), whereas the philosopher had distinguished them clearly. According to this new interpretation of prudence, intellectuals had to make it coincide with moral aims. Sixteenth-century writers adopted Aristotle’s definition of “prudence” in order to resolve the conflict between ethics and politics. However, they misunderstood him when they interpreted prudence as a virtue that inspires political action.

Political literature made increasing use of “prudence” until it became the main instrument for

Botero's theory of "reason of state" as a strategy for the conservation of power. This was possible because Quattrocento political writers tended to praise prudence as a practical, empirical virtue to the detriment of a contemplative virtue such as wisdom, due to the increasing importance given to political life at the expense of contemplative life. The theorists of "*ragion di stato*" kept using a theoretical definition of "prudence" in order to explain the essence of "reason of state." Depending on the aim that one pursues (utility for its own sake or utility combined with religion, morality, and honesty), the outcome is a bad or a good prudence, a bad or a good "reason of state" (Frachetta 1592; Bonaventura 1623). One further instance of this transformation is visible in the Latin translation of the *Thesoro politico* (Coloresco 1589), which adopted the title *Praxis prudentiae politicae* (Schönwetter 1610) (Testa 2008). Thus, according to the theorists of "reason of state," the evaluation of the good of the state pertains to "prudence," but it is in the practical action to be undertaken for the good of the state that the authors cannot explain how an immoral action might be justified. Therefore, the attempt to define whether "reason of state" was acceptable or not remained unanswered. The author who placed the long debate to rest was Ludovico Zuccolo (1621), who affirmed that each country has its own "reason of state," in that it acts according to the characteristics and the needs specific to that country.

The Concept of Interest of State

The debate about "reason of state" did not produce any further new idea or acceptable compromise, until a new expression, already used by some Cinquecento writers, gradually replaced it. A concept that became interchangeable with "reason of state" was "interest of state" (Meinecke 1998 [1924]; Burke 1991; Taranto 1992; de Rohan 1995). Scholars have worked to define the origin and the different use of "interest" and found that "reason of state" was replaced by the expression "interest of state" first in sixteenth-century Italy and later in France.

Once again, we have to return to Francesco Guicciardini to see the first instances of

association between "interest" and political affairs, when he transferred the term "interest" from commercial language to political language (McKenzie 1981). Guicciardini was the first to use the locution "interest of state" and also made extensive use of the term "*utile*" (or *utilità*) meaning public interest, in order to describe "interest" in a way that he felt appropriate. In both *Ricordi* (Maxims) and *Storia d'Italia* (History of Italy), Guicciardini also drew a dividing line between a contemptible "personal interest" and a praiseworthy "interest of state." Thus, "interest" assumed the positive values of the Latin "*utilitas*" when it referred to the community, whereas it acquired a negative connotation when it referred to private issues. With this distinction in mind, the Cinquecento tendency to use the word "interest" became steadier, as can be seen in such normative authors as Giovanfrancesco Lottini and Paolo Paruta, as well as in the ambassadors' reports. The replacement of "reason of state" with "interest of state" appears already in the subtitle to the first edition of the successful *Thesoro politico* (Coloresco 1589). The essays contained in this miscellany make extensive use of the word "interest," and this certainly helped to popularize this and related expressions such as "private interest" (*interesse privato*), "one's interest" (*interesse proprio*), or "interest of the state" (*interesse dello stato*). This was possible not just because of the frequent use of the word but also because the writings contained in *Thesoro politico* were conceived to explain and reveal the true interest of states to the public. The target of the "*relazioni*," "*istruzioni*," and some of the "*discorsi*" were politicians, scholars, or institutions, with specific charges: the Venetian Senate, papal nuncios, cardinal-nephews, chancelleries, or bureaucratic apparatuses. The subtitle to a subsequent edition of *Thesoro politico* (1600) showed how "reason of state" and "interest of state" had become interchangeable: *La prima parte del Thesoro politico, in cui si contengono Relationi, Istruzioni Trattati et varii Discorsi, pertinenti alla perfetta intelligenza della ragion di stato et all'intiera cognitione degl'Interessi, et dipendenze dei più gran Principi, et Signori del Mondo* (The first part of the *Thesoro politico*, which contains

reports, instructions, treatises, and various discourses related to the perfect understanding of reason of state and to the knowledge of the interests and subordinations of the greatest princes of the world (1600)).

A few years earlier, Giovanni Botero had warned that what princes mostly seek is interest and thus a prince should also be careful that he does not have relationships with anyone who may be unable to obtain some advantage from this. In subsequent additions to his *Della ragion di stato* (Botero 1598), he eventually conceded that “reason of state” and “reason of interest” are the same thing.

As for the relationship between “interest of state” and foreign policy, Venetian ambassadors excelled in describing the characteristics of particular states and in drawing conclusions about the most likely actions of that specific state at international level, once the prince has understood the particular requirements of that state. In this sense, Venetian ambassadors were considered capable of detecting and, to some extent, predicting the action of the states within the international context. Thus, their *relazioni* represent a first step toward the analysis of international relations, although they do not provide a complete picture of the international arena.

In the seventeenth century, a further development of the inquiry into “interest of state” appears in the so-called *anatomies de l'Europe* (anatomies of Europe), a series of “discourses” published in France from 1617 to 1627, which aimed to describe the political interests at stake in various disputes among European powers (Thuau 1966). These short discourses described the current political relationships between European states without taking into consideration moral concerns. Finally, in his *De l'intérêt des princes et estats de la chrestienté* (1638), the Huguenot Henri de Rohan stated that “the prince governs the people, but the interest governs the prince.” This straightforward sentence underscored the importance of studying each European country's political interest and warned the prince that he ought to keep such interests in mind, should he want to understand and survive the rapidly changing geopolitical relationships between European countries.

Reformation

Grantley McDonald

Vienna, Austria

Abstract

The term “Reformation” refers both to a process and to a complex of religious and political events in Europe between about 1500 and 1650. This rapid and cataclysmic breakdown in the religious and political consensus that had

held for hundreds of years laid the foundation for later configurations of religious and secular politics. The Reformation also altered the development of two earlier intellectual movements, scholasticism and humanism, absorbing and transforming both. The crisis of authority caused by the Reformation also contributed to fundamental shifts in early modern epistemology and political theory.

Historiography

Until the twentieth century, histories of the Reformation tended to serve denominational ends. Earlier historians routinely treated the period 1500–1650 from their own religious perspective. Some took the sources of the sixteenth and seventeenth centuries at face value. Many failed to distinguish the problems of the Reformation from those of their own time. More recent historiography has attempted to examine this massive social and religious upheaval in more neutral terms, and to appreciate the success or failure of individual groups according to the terms of those involved, to the extent that the individual historian's personal biases, training, and overview of the extant sources allow.

George H. Williams (1914–2000) characterized major reformers who cooperated with princely or municipal powers, such as Martin Luther (1483–1546), Huldrych Zwingli (1484–1531), and Jean Calvin (1509–1564), as exponents of a “magisterial Reformation.” Williams also encouraged historians to reintegrate the “Radical Reformation” into their historical narratives and emphasized that the three major streams of Reformation theology – Roman Catholic, magisterial, and radical – can only be understood properly in terms of the relationships between all three (Williams 1992).

The Reformation and Other Religions

Although the Reformation was an event internal to the Christian church(es), other religious communities in Europe, notably Jews and Muslims, also played a role in this process. The expulsion or

forced conversion of Muslims and Jews in Spain in the late fifteenth century led to the formation of the Spanish Inquisition, which subsequently investigated the orthodoxy of Catholic reformers like Erasmus and drew up several editions of the Index of Forbidden Books, which proscribed the trade and reading of Protestant literature and other writings of suspect orthodoxy. Luther's apocalypticism was fueled not merely by his belief that the papacy had come to represent the Antichrist of Revelation but also by fears of Turkish military advances and a conviction of the immanent conversion of the Jews, a hope that spawned bitter recriminations when it failed to eventuate. The pragmatism of the Dutch Reformation provided Jews and other minorities a degree of toleration, even if this was partly motivated by economic considerations.

Medieval Traditions of Reform

The desire to reform the Church was not new to the sixteenth century. Throughout the middle ages, the Church had convened councils to clarify points of doctrine and to reform abuses and shortcomings in the administration of the Church and the conduct of both clergy and laity. For example, the Fourth Lateran Council (1215) insisted on doctrinal orthodoxy, ecclesiastical discipline, clerical morality, appropriate observance of the liturgy, and correct procedure in appointment to Church offices. Many monastic orders were born when members of older ones came to believe that the ideals of their founders were no longer being properly observed. Thus the Cistercian order grew out of the Benedictine order and the Observants and Capuchins out of the Franciscan order. The late middle ages also produced movements for educational reform, such as the Brethren of the Common Life, who promoted learning and devotion among the ascendant bourgeoisie of northwestern Europe.

The credibility of the papacy suffered during the Great Schism (1309–1417), when rival papal courts operated from Rome and Avignon. During this time, those who upheld the ultimate authority of the pope clashed with those who promoted that

of Church councils. While earlier reformers and reforming councils emphasized orthodoxy, late medieval reformers such as John Wycliffe (c. 1330–1384), a professor at Oxford who criticized clerical immorality and translated the bible into English, and Jan Hus (1369–1415), a professor at Prague who repeated Wycliffe's criticisms, were condemned for overstepping the bounds of orthodoxy and promoting heresy. Many Roman Catholic opponents of the sixteenth-century Reformation applied the Church's condemnations of Wycliffe and Hus to evangelical reformers, some of whom identified these men as their spiritual forebears.

Reform as a Theme in Renaissance Humanism

Renaissance humanists, convinced that the previous thousand years had witnessed a corruption and decline in linguistic usage and cultural orientation, attempted to recover the languages and literature of classical antiquity (Latin, Greek, and eventually Hebrew and other Near Eastern languages) and to reform education along ancient lines. They believed that ancient historical, philosophical, and literary works provided valuable instruction in ethical behavior. The desire to return "to the sources" (*ad fontes*) inspired some humanists to carry out philological work on the text of the bible. In the introductory materials to his 1516 edition of the New Testament (*Paraclesis, Methodus, Apologia*), Desiderius Erasmus of Rotterdam (c. 1466–1536) expressed the hope that greater access to the bible, not only among scholars but also among the ordinary folk, would revive the simple "philosophy of Christ" practiced by the early Christians, a contrast to the sophisticated logical distinctions of scholasticism. Virtually all the Protestant reformers were influenced in some way by the reformatory impulses of Renaissance humanism. For example, Philipp Melancthon (1497–1560) emphasized the importance of dialectic and rhetoric in training students to construct sound arguments and express them convincingly on the page and from the pulpit; among the best models of these arts were to be

found in ancient literature (Dingel, et al. 2012). However, while the study of the Bible and the Church Fathers in their original languages strengthened through the sixteenth century, it was often pursued for sectarian ends, to justify the doctrinal position of a particular church.

While many of the reformers appropriated the humanists' desire to recover the benefits of antiquity, and harnessed their educational methods and literary style, humanism was irrevocably altered by the eristic culture of the Reformation. This change can be seen in individual authors. For example, Johannes Cochlaeus, an important humanist educator in Nuremberg in the 1510s, subsequently became a prolific Catholic polemicist, bitterly pursuing Luther and Melancthon in print for over three decades. In a caustic biography, Cochlaeus depicted Luther as a drunken and lustful charlatan, an image that remained influential in Catholic polemic until the twentieth century. By the end of the sixteenth century, the sunny faith in the humanizing power of classical studies held by pre-Reformation humanists would seem quaintly naive.

Critiques of Scholasticism

Scholasticism was not so much an identifiable set of doctrines as a method of organizing and articulating knowledge in a strictly logical way by framing the issue at hand as a question or thesis, organizing and defining its terms in a way suitable for discussion, putting forward and resolving potential objections, and then offering a resolution of the issue (Leinsle 2010). Nevertheless, some Renaissance philosophers and humanists objected to the way scholastics used propositions and categories from ancient pagan philosophy to express the Christian faith. Some condemned the use of Aristotle's logical methods and metaphysics to articulate Christian doctrine. Some objected to the "barbarous" Latin style of scholastic philosophers, others to their lack of interest in ethical improvement. Others had an ambivalent attitude towards scholasticism. The fifteenth-century Platonist Marsilio Ficino (1433–1499) complained that many scholastic philosophers had absorbed

concepts from Aristotle or the Arab philosopher Avicenna which contradicted Christian teaching on the creation of the world or the immortality of the individual human soul. Yet humanist objections to scholasticism were not indiscriminating; Ficino quoted Thomas Aquinas often and in some works imitated his systematic method.

Skepticism and Eclecticism

The crisis of authority of the early sixteenth century and the disagreements between professional theologians about fundamental beliefs led some to a philosophical skepticism. Erasmus, for example, suggested that non-essential elements of doctrine over which even experts disagreed should be considered optional. (Here Luther disagreed: he considered that in the matter of salvation, the stakes were so high that the Church had to be sure that it was teaching true doctrine.)

Yet few Renaissance thinkers adopted ancient skepticism as a complete philosophical system. Where such theologians and philosophers used the work of ancient philosophers, it was usually in an eclectic manner. Rather than treating the ancient philosophical schools as internally consistent systems of thought aimed at the transformation and perfection of the self – a notion that Protestant theologians rejected as a path to Pelagianism – later Renaissance theologians and philosophers tended to treat them as repositories of individual notions from which they could choose what suited them.

Luther's Reformation

Martin Luther was an Augustinian friar, priest, and professor of Scripture at the recently founded University of Wittenberg. As a young friar at Erfurt, Luther despaired when his strict adherence to the monastic life and intense study of the Bible failed to bring him inner peace. He became obsessed by the idea of God as righteous judge. Wondering if salvation was possible, he confessed his sins with painful precision. As a student of theology, he trained in the nominalist *via moderna*

and read works by medieval mystical theologians and recent humanists such as Johann Reuchlin. However, the greatest theological influences on Luther were Paul and Augustine. In his lectures on the Psalms, Romans, Galatians, and Hebrews (1513–1518), he increasingly turned from the interpretive tradition of the medieval Church in favor of a consciously biblical hermeneutic.

While giving these lectures, Luther's interpretation of God's righteousness (Romans 1:17) changed radically; he understood it no longer as a demand of the law but as a gift of the Gospel. Luther did not arrive at his new interpretation of the Gospel on his own. His mentor Johannes von Staupitz, in the spirit of medieval meditation on the passion, encouraged Luther to focus on God's mercy in the atonement. Luther was also influenced deeply by Erasmus' conviction that a knowledge of the Bible and a simple devotion both lay at the heart of Christianity. Erasmus' Latin-Greek diglot New Testament also proved decisive. For example, he argued that the word *metanoeite* (Mark 1:15, Matthew 3:2, 4:17) should be translated not as "do penance," as Jerome's translation suggested, but "repent" or "change your way of thinking." This insight contributed to Luther's reconsideration of the Church's teachings on sin and repentance; he concluded that scholastic theology had obscured this insight and proposed that the curriculum of the University should be radically reoriented, to be founded on the Bible and the early fathers rather than on the scholastics. Likewise, Erasmus pointed out that *mysterion* (2 Thessalonians 2:7; Ephesians 5:32) means "mystery," not "sacrament," and that *dikaiosis* (Romans 4:3–5) does not imply "making righteous" but "reckoning as righteous." Such insights from Erasmus' commentary on and paraphrases of the New Testament prompted Luther and other evangelicals to reject much traditional Church teaching as based on cumulative misunderstanding of the biblical text.

During the middle ages, several related doctrines concerning sin had developed. Late medieval theologians taught that purgatory was a real place through which the souls of the dead must pass to be purified for heaven. They also taught that the accumulated merits of the saints can be

offset against the sins of ordinary believers and that the sacrifice of the mass can propitiate God and avert the punishment due for sin. In the late middle ages, mass foundations and devotions to the saints and to the Eucharist itself thus joined penitential exercises as means of spiritual purification and perfection, both for the living and the dead. Since the popes claimed to be the successors of Peter, to whom Jesus gave power to bind or loose in heaven and earth (Matthew 16:18), they granted remission of the punishment due for sin ("indulgences") when an individual performed some devotional act or paid a sum of money in lieu. However, the doctrine of indulgences was not articulated clearly, and the laity could easily come to believe that they were purchasing salvation for themselves or deceased relatives.

In 1517, Albrecht von Hohenzollern authorized the sale of indulgences within his territories to fund the massive debts he had incurred to secure his election as archbishop of both Magdeburg and Mainz and to send money to Rome for the construction of a new church to replace the dilapidated St Peter's Basilica. This campaign led Luther to criticize the theory and practice of indulgences in a series of 95 theses proposed for disputation, which he pinned on the door of the Castle Church in Wittenberg, the noticeboard of the university.

Luther's theses began with a declaration that the Church's doctrine of penance was unscriptural, a conclusion he clearly reached through his reading of Erasmus. He denied that punishment for the sins of the dead could be forgiven through the activities of the living. He also emphasized that the life of the Christian must be characterized not by acts of outward penance but led entirely by a spirit of true penitence, through which alone one might receive remission of penalty and guilt. The pope, he continued, had every right to bestow blessings or remit punishments imposed by himself; but the Church, by arrogating to itself the right to forgive or reserve sins, even those of the dead, had wickedly sought to oppress faithful believers through the fear of damnation, in contravention of the Gospel. Furthermore, those who relied on indulgences for salvation, rather than a constant attitude of penitence and charity, were damned.

Luther's theses were printed several times without his authorization and tore through Germany. Albrecht von Hohenzollern denounced Luther and informed Rome. The theses were refuted by Albrecht's indulgence seller Johann Tetzel and the theologians Konrad Wimpina and Johannes Eck. Luther defended his position at a meeting of the Augustinian order at Heidelberg in 1518. He also addressed an exposition of his theses to Pope Leo, whom he personally admired. Following the late-medieval conciliarist tradition, Luther asserted that individual popes could err and that only a council could lay down doctrines, so long as these were consistent with Scripture, the Church Fathers, and Church law. Luther's ideas were encapsulated in memorable slogans that Christian doctrine and conduct should be guided "by Scripture alone" (*sola Scriptura*) and that believers are justified "by faith alone" (*sola fide*) and are saved by God's "grace alone" (*sola gratia*) and not by good works. Luther's ideas were spread rapidly by the printing press. By contrast, the failure of many of Luther's opponents to match his skill in exploiting the possibilities of print limited their chances of winning the publicity war.

Luther was summoned to appear at the Imperial Diet at Worms in 1521. When asked to renounce his heretical views, he refused, arguing that his conclusions were based on Scripture and reason, which he considered superior to the pronouncements of popes and councils. This meeting precipitated a crisis of authority which would have far-reaching consequences for philosophy. In return, Charles V declared Luther an outlaw and forbade trade in his books and public promotion of his ideas. However, Luther was protected by Duke Friedrich of Saxony, his temporal overlord and founder of the University of Wittenberg. Friedrich's protection allowed Luther's Reformation to continue. During the Reformation, the relationship between belief, orthodoxy, and temporal authority would be reconfigured in significant ways and would lead to bloody wars in France, the Netherlands, and the Holy Roman Empire.

In hiding after the Diet of Worms, Luther translated the New Testament into German with the

help of Erasmus' edition. Later he translated the Old Testament as well. Luther shared Erasmus' desire to place the Bible into the hands of the laity, stripped of medieval allegorical interpretation. Luther's Bible translation, which consciously drew features common to middle German dialects and the linguistic norms of the Saxon chancellery, became a foundational document of early modern German. While Luther initially believed that the Holy Spirit would lead sincere readers to true understanding of the Bible, the disorder of the Peasants' War proved to him that leaving Scriptural interpretation to the untrained was asking for trouble.

For the rest of his life, Luther attempted to articulate his understanding of Christian doctrine in various ways: in lectures, sermons, treatises, biblical commentaries, catechisms, and songs. He experienced resistance not merely from Catholic apologists but also from other Protestants, many of whom started from similar premises and insights but came to quite different conclusions.

Luther and Philosophy

Luther received his initial theological training in scholasticism, more specifically in the *schola moderna* of William of Ockham and Pierre d'Ailly and in the *schola Augustiniana moderna* of Gregory of Rimini. However, he later attacked Aristotle and many of the presuppositions of scholasticism. While Aquinas believed that the light of reason within the human mind remained unaffected by the Fall, Luther insisted that human reason, including that of the pagan philosophers, is irreparably corrupt and incapable of revealing the truth, which is only laid bare in Scripture. The epistemological and ethical pessimism of Luther and the other Protestant reformers inevitably affected their view of philosophy as a rational activity. Their insistence on the bible as the sole source of ultimate revelation – Luther famously described the human conscience as captive to the Word of God – was rooted in the principle of *sola Scriptura*. While Catholic apologists declared that Scripture is sometimes obscure and requires explanation, the Protestant reformers replied that it is

always clear in important matters. And whereas the Catholic Church taught that one should implicitly believe doctrines that one cannot understand simply because the Church had declared them to be true, Protestant reformers insisted that believers had to understand doctrines before they could fully assent to them and should not unquestioningly accept the authority of another fallible human, even a member of the clergy. For Luther, the clergy had an important role in teaching and dispensing the sacraments but could make no claim to relationship with the divine or special insight into divine mysteries.

Luther also objected to the application of Aristotle's ethics to Christian theology. Aristotle taught that virtue results from the habit of practicing virtuous actions. Some medieval theologians, developing this idea, taught that humans must act virtuously to receive the grace necessary for salvation. By contrast, Luther taught that humans, enslaved to original sin, are incapable of performing truly righteous acts. However, God imputes Christ's righteousness to humans and thus declares them justified. It is possible that Luther may have developed this idea from his reading of Gregory of Rimini. Calvin too insisted that righteousness is not an interior quality but is external to us, granted by God. This interpretation would be disputed by Catholic apologists.

One element that Luther and Calvin probably borrowed from the *schola moderna* was voluntarism, a philosophical position that emphasizes God's power to ordain a particular state of affairs, unrestrained even by the demands of reason. God does not command us to perform good works; however, certain works are considered good because God deems them to be good. Even Christ's redemptive work was effective only because God considered it to be so. And even if predestination may seem contrary to natural justice, it is nonetheless good because God chooses it.

Furthermore, Luther objected to the application of Aristotle's physics to Christian theology. For example, medieval theologians, notably Thomas Aquinas, had used Aristotle to explain the doctrine of transubstantiation: at the consecration, the substance of the bread and wine are

transformed into that of the body and blood of Christ, while their accidents (color, taste, smell) remain unchanged. Luther rejected Aquinas' explanation as founded upon neither Scripture nor reason and disputed the Catholic Church's claim to competence in explaining such matters. Other Protestant reformers shared Luther's objections to transubstantiation but provided widely varying accounts of what happens during the Eucharist. While Luther maintained that Christ is truly present in the bread and wine, even if they were not physically transformed, Zwingli interpreted the Eucharist as a symbol and memorial of the Last Supper. In response, the Council of Trent reaffirmed Aquinas' explanation (McGrath 2004).

Luther's associate Philipp Melancthon eventually overcame some of Luther's conclusions about the depravity of human reason and many of his objections to Aristotle, appreciating that classical logic could provide a useful structure to organize the theological propositions of evangelical theology (Kusukawa 1995). While Melancthon disagreed with many of the positions and distinctions of individual scholastic philosophers and objected to the "misuse" of philosophy in theology, he still appreciated the scholastics' systematic approach to theology and used some of their methods. Melancthon's most famous exposition of Christian theology was his *Loci communes* (1521, revised three times), ostensibly a commentary on the themes of Paul's letter to the Romans arranged under general theological headings with illustrative examples. Melancthon did not seek to Christianize Aristotle's philosophical ideas, as did many late medieval theologians, but made use of the technical philosophical means offered by the Stagirite. In this he claimed to refine the method of scholastic predecessors such as Peter Lombard.

Aristotelian scholasticism thus remained an important method for articulating Christian doctrine and natural philosophy. Despite the opposition of many Catholic humanists in the early sixteenth century, it was still used by important Catholic theologians and philosophers such as Tommaso de Vio (or Cajetan, 1469–1534) and Francisco Suárez (1548–1617). And despite

Luther's hostility, it was later used by distinguished Protestant philosophical theologians such as Abraham Calov (1612–1686).

Early Lutheran Radicalism

While Luther remained in hiding following the Diet of Worms, some of his supporters began to put his criticisms of the traditional Church into action. Andreas Bodenstein von Karlstadt, the dean of the theological faculty at Wittenberg, introduced a radically simplified liturgy. Luther was horrified, believing that such a sudden alteration would alienate simple believers, and he returned to Wittenberg briefly in early 1522 to restore order. A group claiming prophetic powers appeared from Zwickau, but Luther denounced them and Karlstadt as dangerous fanatics. From this time, the Lutheran Reformation followed a consciously conservative direction.

Reactions to Luther

Reaction to Luther was mixed. Many humanists supported him, at least initially. His following was greatest in densely populated cities and towns, where there were higher levels of education, critical thought, and literacy. He gained many supporters among the religious, especially the Augustinian order to which he belonged. Many monks and nuns preached his ideas or left their convents altogether. Luther's defiance of papal excommunication (1520) prompted many to hail him as defender of Germany against curial rapacity. By contrast, many churchmen were aghast at Luther's frontal attack on papal authority and the doctrine of penance. Many misinterpreted him as teaching that good works were not necessary for salvation, and as promoting antinomianism (rejection of custom and lawful authority), a misunderstanding he refuted.

From the very beginning, Catholic theologians in Germany struggled to meet Luther's challenge head-on. They emphasized that Luther's disagreements with the doctrinal consensus that had united the Church to that point proved his error. They

refuted his insistence on the sole authority of Scripture by pointing out that the Church had always interpreted the Bible where it was unclear and transmitted doctrines held by the early Church not explicitly taught in the Bible. Disagreements between Protestant groups over the correct interpretation of Scripture proved the insufficiency of Scripture as sole guide to Christian life and teaching and the need for an ultimate doctrinal arbiter, the Church. However, their responses were generally ill-coordinated, often lacked official support, and sometimes led merely to mutual name-calling.

However, Catholic polemicists sometimes managed to reframe the issues. While Luther's *Ninety-Five Theses* attacked indulgences, Tetzel, Prierias, and Eck interpreted them as a covert assault on papal authority, a more dangerous proposition, and attacked him on these grounds. Indeed, the nature of the Church (ecclesiology) was perhaps the central issue in the early years of the Reformation, at least in the eyes of Catholic defenders. Even the Reformation principle of *sola Scriptura* implied conclusions about the nature of the Church.

While not all Catholic theologians writing after 1517 engaged in direct polemic, the Reformation had fundamentally altered the nature of theological discourse. Significantly, many of those who defended the old faith were not professional university theologians but educated clerics and even laypeople. Consequently, the character of their writing is heterogeneous. The issues they addressed most frequently included the limits of papal authority; the relative importance of Scripture and the Church's magisterium in matters of doctrine; the number and nature of the sacraments – particularly the mass, confession, baptism, and priestly vows – and their proper administration and maintenance; the veneration of the saints and their images; and purgatory. The attitudes of Catholic polemicists towards Luther were not uniform and reflect the variety of positions within the Catholic Church on matters such as the nature and limits of papal power. Humanist philology also played a role in these debates, as when Protestant critics pilloried their Catholic opponents for relying on texts which

humanists had dismissed as later forgeries, such as the *Donation of Constantine* or the writings of pseudo-Dionysius.

The character of the Catholic response to Luther changed over time. Until the 1530 Diet of Augsburg, most writing was adversarial. During the next decade, many Catholic writers worked towards finding points of agreement with Protestants, discussed at a series of colloquies. The years following the Colloquy of Regensburg (1541), which failed to find a consensus between Catholics and Lutherans, saw an increase in propaganda directed primarily towards a Catholic readership, including catechisms for instructing the laity and sermons that provided material for preachers. (Further, see Pettegree 2000, 97–108.)

Zwingli's Urban Reformation

The Swiss priest Huldrych Zwingli, more strongly influenced by humanism than Luther, was appointed as preacher at Zurich in 1519. Zwingli held that Christian society should be governed by civic government and the Church equally and insisted even more strongly than Luther that all aspects of society should be based upon Scripture. However, Zwingli and Luther clashed over their understanding of the Eucharist. Luther rejected the Catholic doctrine of transubstantiation but maintained that Christ is truly present in the elements of the Eucharist. By contrast, Zwingli believed that the Eucharist was only a memorial or symbol of the Last Supper. When they met at Marburg in 1529 to discuss the matter, they could not reach a compromise, and the division poisoned relations between Lutherans and Swiss Reformed for decades. (Further, see Pettegree 2000, 169–189.)

Anabaptism

Anabaptism grew out of disputes within the Zurich Reformation. Conrad Grebel and Felix Mantz disagreed with Zwingli over the tithe and admissibility of images in church. They also criticized Luther and Zwingli for underplaying the

importance of faith in ethical transformation. More importantly, they maintained that true discipleship demanded that believers make a conscious choice to become Christians. If we are justified by faith, then children too young to possess such faith should not be baptized. This position undermined the traditional theology of baptism, the sacrament that traditionally signified membership within the Christian Church. At Zwingli's recommendation, the Zurich city council mandated infant baptism in January 1525, but several adults in Zurich had themselves baptized again in defiance of the ruling, an action that led to their denunciation as "Anabaptists," that is, "rebaptizers." (Further, see Pettegree 2000, 237–256.)

The Peasants' War

Many saw Luther's defiance of the imperial ban (1521) as a challenge to the existing political order. The European peasantry was still dominated by its feudal masters: ecclesiastical institutions, prelates, and secular princes. The decades before the Reformation saw several peasant revolts in Germany, which sought to redress old grievances. In 1525–1526, groups of peasants radicalized Luther's notions of the "Gospel" and the autonomy of the "Common Man," and Zwingli's conviction that society was to be reformed in conformity to God's will for the common benefit, and took up arms against their overlords. Some were also inspired by the Anabaptist desire to transform the existing order. The rural uprisings of the 1520s, which gained moral force from the identification of political and religious grievances, threatened even greater dislocation than the urban reformations, both because of the numbers of people involved and because they called for the flattening of traditional hierarchies and feudal obligations to both secular and ecclesiastical lords.

Some peasant groups were inspired by the clergyman Thomas Müntzer, who was initially inspired by Luther but subsequently accused him of weakness and conformism. Müntzer claimed that God speaks the "inner word" of true faith only to those who suffer. The godly would usher in

God's kingdom on earth and violently destroy the godless forces of tradition and unearned privilege. Luther condemned Müntzer as a fanatic and condemned the armies of peasants for daring to bring violence against the hierarchies established by God. Encouraged by Luther, the secular powers – both Catholic and evangelical – decisively defeated the peasant armies through superior weaponry and military discipline. Müntzer was captured and executed. This tragic outcome damaged the popular appeal of the Reformation among large segments of the population. It also rendered authorities suspicious of religious and social radicalism. Wherever the Reformation was introduced after this time, authorities strove to keep the process of change firmly under control. Anabaptists who saw the Peasant uprisings as a chance for the "Common Man" to break free of traditional society now concluded that the only way to realize their aims was in separate communities. When secular and ecclesiastical authorities persecuted these communities, they merely strengthened their sense of election. Catholic polemicists pointed to the uprisings as proof of the seditious and revolutionary character of Luther's message. (Further, see Pettegree 2000, 127–145.)

The Anabaptist Kingdom of Münster

The preacher Bernhard Rothmann, who spread Luther's message at Münster from 1531, soon gained such support in the city that the city magistrates introduced the Lutheran Reformation by 1533. But when Rothmann began to preach ideas closer to those of Zwingli, the situation became unstable. At that moment, followers of the Anabaptist Melchior Hoffman, who had predicted that the world would end in 1533, arrived in Münster. In the meantime, Hoffman's successor Jan Matthys proclaimed to his followers that the end would come at Easter 1534 but that they could save themselves by accepting true baptism. When more Anabaptists arrived in Münster, many citizens left. The now dominant Anabaptist party in the city was voted into power in the city elections. Matthys mandated adult baptism and community of property, under pain of expulsion. Meanwhile,

the bishop of Münster had laid siege to the city to regain control. After Matthys died, he was succeeded by the tailor Jan van Leiden, who proclaimed himself as king and introduced polygamy. Finally, the bishop managed to take the city in June 1535. Most of the Anabaptists were killed, while their leaders were seized and hung in cages until they starved. The Kingdom of Münster, following a decade after the Peasants' War, convinced many authorities that the Reformation should be nipped in the bud. This led to the forcible suppression of Anabaptism and prompted those who identified with the magisterial Reformation to distance themselves from potentially destructive "enthusiasm."

Catholic Reformation and Counter-Reformation

While the Reformation in Central and Northern Europe was motivated by local considerations, such as long-standing tensions and resentments between the Empire and Rome, conditions in Italy, the home of the papacy, were different. Frequent Italian disdain for Germany rendered the Reformation unpalatable to many south of the Alps. Furthermore, there was a tradition of Italian dissent and reform that remained under the mantle of the Catholic Church.

Religious life in the early sixteenth-century Italy brought together several strands. The Black Death had led to an increased emphasis on collective acts of penance, which sometimes reached extreme heights, such as the purges of "vanities" led by Savonarola in Florence. Many Italian theologians encouraged an affective interior religiosity and encouraged the laity to nourish their knowledge of the faith through sermons and devotional literature and to participate more fully in the corporate life of the Church by receiving the sacraments more frequently. Confraternities continued to combine pious exercises with charity.

Italy also witnessed varieties of religious dissent that approached some Protestant doctrines but usually avoided its political implications. The Spanish Catholic thinker Juan de Valdés (c. 1500–1541) spent the last 6 years of his life

at Naples, where he promoted a religiosity that emphasized ethical conduct more than doctrine and even taught justification by faith. His followers, known as "Spirituals," included the cardinals Reginald Pole and Gasparo Contarini. Valdés's works were placed on the Index of Forbidden Books but were used extensively by Protestants. While some of Valdés's followers, including Pole, remained within the Catholic Church, others, including the Augustinian Pietro Martire Vermigli and the Capuchin Bernardino Ochino, converted to Protestantism and fled to Geneva and then to England, where they contributed to the establishment of Protestantism under Edward VI. Ochino ended his life in a Hutterite Anabaptist community in Moravia.

The reaction of the Roman Catholic Church was determined by medieval approaches to heresy, understood as a willful rejection of true doctrine, judged by the Church and punished by secular authorities. The Catholic Church responded to the challenge of evangelicalism in many ways. As some orders, such as the Augustinians and Franciscans, lost ground to the Reformation, new orders were founded in the 1530s and 1540s, such as the Ursulines, Capuchins, and Jesuits, and in the 1560s, the Reformed Carmelites.

The Catholic Church saw the first constructive measures to deal with the Protestant Reformation under Pope Paul III (1534–1549). In 1536, Paul appointed a commission of nine prelates under the leadership of Cardinal Contarini to investigate the state of the Curia. The following year the commission tabled a damning report, *A Recommendation on the Reform of the Church*, which detailed abuses in the Curia, particularly financial mismanagement. A manuscript of the report was taken to Strasbourg, where it was printed. Luther translated the work into German and added his own ironic commentary. Although Paul III did not act directly on the *Recommendation*, he began the process of convening a general council of the Church to address abuses, to redefine certain doctrines more clearly, and to point a way forward. In 1540, Paul approved the foundation of the Jesuits, who were deployed in flexible ways to promote Catholic orthodoxy, particularly in education and foreign missions to the Americas and the Far East.

In 1541, representatives of the Catholic and Lutheran churches met at Regensburg to try to reach an accommodation, but they failed to agree on many issues. Paul III and Charles V then convened an internal council, on one hand to renew the Church's institutions, doctrine, and spirituality (the "Catholic Reformation"), and on the other, to refute the claims of the Protestants and repair the losses caused by the Reformation (the "Counter-Reformation"). The Council, which sat several times at Trent between 1545 and 1563, clearly articulated the Catholic position on doctrines questioned by the reformers, including justification, the sacraments, and the relationship between Scripture and tradition. Moreover, it emphasized the Church's sole competence to make such definitions and pronouncements. The Council also sought to reform and streamline the institutions and practices of the Church. It promoted better education of the clergy, strict observance of monastic vows, and moral probity among the entire clergy. Furthermore, it mandated that bishops, resident in their diocese, should carry out visitations and convene synods to enforce conformity.

The Council was a mixed success. It shored up further internal decay by reaffirming the ecclesiastical hierarchy and insisting that the clergy of all levels, whether regular or secular, maintain a high moral standard. It promoted a wider knowledge of doctrine among the clergy and laity alike, especially through preaching and catechisms. It initiated a period of cultural, architectural, and artistic flowering within the Catholic Church. However, it also led to the entrenchment of doctrinal positions and the hardening of denominational divisions. It also failed to consolidate Rome's temporal power. After the Council, the curia still had to rely on the cooperation of local bishops to promulgate the Council's directives and of the secular powers to restrain or punish those who transgressed them.

The Militarization of Religion

Charles V's demand that the Lutheran princes and cities return to the Catholic Church in 1531 resulted in the formation of the defensive League

of Schmalkalden, which was to resist the threatened military consequences. After defeating the League in 1546–1547, Charles tried to re-impose Catholicism in 1548, a measure known as the Augsburg Interim. Lutheran resistance to the Interim led to a military counterstrike in 1552. In 1555, a peace was declared at Augsburg, which obliged the rulers of the Empire to declare whether their territory would henceforth be Catholic or Lutheran. This peace held until the Thirty Years' War.

The Unpredictable Reformation: England

The Reformation in England differed in several important respects from the continental Reformations. Firstly, it was motivated not so much by religious questions as by political ones, primarily the desire of Henry VIII for a male heir and for independence from Rome. Secondly, it was introduced in a series of acts of state. Thirdly, it lacked major religious leaders of the caliber of Luther, Zwingli, or Calvin. Fourthly, it differed in that a woman, Anne Boleyn, played a major role in its introduction and implementation, despite her brief ascendancy.

Henry VII and his son Henry VIII had brought England under firm central control and the habit of aristocratic deference held for the rest of the sixteenth century. Despite the vicissitudes of the English Reformation, the aristocracy generally limited any resistance to low-level obstructionism. The only other force in England that could have opposed Henry's introduction of the Reformation, the City of London, was divided over the Reformation. Those who opposed Henry directly, such as John Fisher or Thomas More, were simply removed.

The Reformation in England was ruthlessly pragmatic and disastrously indecisive. Henry VIII mercilessly suppressed those who agitated for reform in the 1520s through a genuine desire for religious renewal, yet when a political break with Rome seemed expedient and profitable in the 1530s, Henry carried it through enthusiastically. A theologically motivated Reformation in the

Protestant sense had to wait until the reign of his son Edward VI, who imported several prominent continental Protestants, such as Martin Bucer, the reformer of Strasbourg, who exercised a considerable influence on the theological and liturgical direction of Anglicanism. Edward's half-sister and successor Mary forcibly reintroduced a conservative Catholicism no longer entirely in step with more recent developments on the Continent. Her Spanish marriage and cruel persecution of Protestants compromised her popularity and success.

The broad and inclusive Protestantism imposed by Mary's successor Elizabeth retained many traditional features such as vestments; Elizabeth famously kept a cross on the altar of the Chapel Royal. Effective implementation of the Elizabethan religious settlement was at first hindered by resistance from a population weary of change and a lack of suitably trained clergy. The reign of Elizabeth also saw growing tensions between representatives of the moderate Protestantism she wished to promote and Puritans and Presbyterians who, returning from exile in Reformed centers such as Strasbourg and Geneva, rejected the Elizabethan Settlement as a compromise.

While some English Catholics quietly conformed to the Anglican Church or went into foreign exile, a small number refused to attend legally mandated Protestant services, receiving spiritual sustenance instead from priests trained in English Catholic seminaries on the continent who returned secretly, despite the threat of imprisonment and execution.

Under the Stuart monarchs in the seventeenth century, tensions within the Church of England between the royalist High Church party and the Puritans combined with political grievances in England and Scotland to plunge the kingdom into a Civil War and decades of political crisis. (Further, see Pettegree 2000, 225–236, 365–386.)

Geneva: An Alternative Model

The background of Jean Calvin, the reformer of Geneva, differed from that of Luther, as did the setting of his pastoral work. Besides studying

scholastic theology, Calvin also enjoyed a good humanist education; his first published work was an edition of Seneca. He also studied law, which he tended to see in more positive terms than did Luther, as a constructive regulatory force within society, laying down Christian norms of behavior.

After Calvin converted to Protestantism, he was pressed into assisting Guillaume Farel introduce the Reformation to Geneva in 1536. However, the city council bridled at the speed of their reforms and asked them to leave in 1538. Calvin went to Strasbourg, where he served alongside Martin Bucer as pastor to French and Flemish refugees. However, the situation in Geneva soon ran out of control, and in 1541 the council invited Calvin to return. Calvin served at Geneva until his death in 1564.

Calvin wrote his major work, the *Institutes of the Christian Religion*, to guide understanding of Scripture and theology. His own theology, set out most fully in the ever-growing editions of the *Institutes*, emphasizes several themes. Calvin adopted many of the fundamental convictions of evangelicalism, such as the conviction that salvation comes by faith alone and that the Scripture, the Word of God, is the ultimate norm against which all doctrines are to be judged. He also emphasized certain themes more strongly than Luther, such as God's sovereignty and providence, double predestination, and the place of Christians in the world. Calvin's emphasis on the goodness of providence makes his theology in some ways more positive than Luther's apocalyptic religious vision. Luther's thinking on predestination was not consistent throughout his life. While he sometimes affirmed Augustine's view that God has elected some people for salvation from eternity, at other times he concluded that others have been excluded from grace. Calvin held to this latter position of double predestination more consistently, though his exposition of this idea in the definitive edition of his *Institutes* (1559) is quite short. His successor at Geneva, Théodore de Bèze, used double predestination as the central axiom of Reformed theology, and in later Calvinist scholasticism, predestination became the doctrine by which Calvinist theologians most typically positioned themselves

against Lutherans. Where Luther thought of salvation as the aim of Christian life, Calvin and his followers considered it as the first step in a human life that should grow in sanctification and goodness, as a reflection of God's glory.

After his return to Geneva in 1541, Calvin implemented his model of an ordered Christian commonwealth, an explicit repudiation of the chaos of Münster, by instituting four orders of ministers – pastors, doctors, elders, and deacons – as well as a disciplinary body, the Consistory. Pastors performed clerical functions, preaching, teaching and admonishing, and administering the sacraments. Doctors preserved and transmitted true doctrine. Elders were laymen chosen by the magistrates to assist the pastors in enforcing discipline in the Consistory, which met weekly to examine those accused of violating public morality, and to discipline them where necessary, regardless of social estate. Deacons carried out charitable work with the poor and sick. (Further, see Pettegree 2000, 309–322.)

The Stillborn Reformation: France

In France, humanists such as Jacques Lefèvre and Guillaume Briçonnet, bishop of Meaux, promoted a return to the ideal of primitive Christianity, including a doctrine of justification coincidentally close to that of Luther. François I initially supported such elite reform, despite the opposition of the Sorbonne and the Parlement. However, François's attitude changed quickly when placards denouncing the Catholic doctrine of the mass were posted around Paris in October 1534. Realizing that the distinction between elite reform ideas and popular disorder could no longer be maintained, François now began to cooperate in the suppression of evangelicalism. François's son Henri II instituted a court for trying accused heretics, which operated from 1547 until 1550. The Edict of Chateaubriand (1551) limited the participation of Protestants in positions of public authority and banned Protestant literature. However, this did little to halt the growing popularity of Calvinism, and a Calvinist church was founded at Paris in 1555. Calvinist books poured in from

Geneva and were also reprinted secretly in France. Calvinist ministers sent into France spread their message through preaching and song, especially among literate city-dwellers. Many French nobles converted to Calvinism. Growing numbers led to increased confidence and visibility. The French crown used military force to check the spread of Protestantism, and between 1562 and 1598, the country was ravaged by a religious war marked by episodes such as the horrific massacre of some five thousand Protestants on and immediately after St Bartholomew's day 1572, the assassination of Henri III, and the conversion of Henri of Navarre to Catholicism to secure the French throne. These wars were also fueled by the religious identities and ambitions of three powerful families in France – Valois, Bourbon, and Guise – and their foreign supporters. The wars frightened some into converting back to Catholicism but prompted others to develop theories of resistance to state power. The French Wars of Religion ended only in 1598, when the Edict of Nantes mandated that while Roman Catholicism was to be the official religion of France, Huguenots were to enjoy toleration and the right to education and political equality. These rights held until Louis XIV revoked the Edict in 1685, leading to the exodus of about 200,000 Huguenots to Protestant states. (Further, see Pettegree 2000, 211–224, 323–343.)

Reformation and Sovereignty in the Low Countries

Evangelicalism spread early in the highly urbanized, highly educated Low Countries. However, Charles V could impose his authority more successfully in the Low Countries than in Germany, and he deployed the theological faculty of the Universities of Leuven and Cologne to investigate heretics and the local authorities to execute them. Such repressive measures simply pushed dissent into underground house churches.

Especially after the repression of the Kingdom of Münster, Anabaptists in the Low Countries were subject to harsh sanctions. The Frisian Menno Simons, horrified by the bloody outcome

of Münster, promoted a pacifist style of Anabaptism, which became the largest Protestant denomination in the Netherlands until the early 1560s, when it was eclipsed by Calvinism. Like other Anabaptists, Simons emphasized the moral purity of the community, the result of conscious imitation of Christ and divine regeneration. If individuals failed to live up to the community's high moral demands, they were to be shunned, in the expectation that the resultant shame would bring about a conversion and reintegration. Simons also taught that the spotless community should bear suffering as part of its programmatic imitation of Christ. The exclusivity, uncompromisingly high moral standards and lack of doctrinal cohesiveness within and between the various Anabaptist groups led to several internal fissures and mutual condemnations.

From the 1540s onwards, Charles V began an offensive against Calvinism in the Low Countries. Nevertheless, Calvinism grew in popularity there, as it had in France, and in 1555 a Calvinist church was established at Antwerp. Margaret of Parma, regent of the Netherlands, realizing the necessity of a pragmatic solution, petitioned Philip II to moderate the heresy laws. When he refused, powerful Calvinists forced Margaret to concede their demands anyway. Protestant agitation boiled over in an outbreak of iconoclasm in 1566. Philip II sent in a Spanish army under the command of the Duke of Alva to put down the rebellion, thus sparking a bloody war that lasted fitfully for the next 80 years. Some Calvinists, especially in the Southern Low Countries, returned to Catholicism. Others took refuge in England or in Emden (Northern Germany), where some produced Protestant literature for export into the Low Countries. While Calvin believed that Protestants should do no more than refuse to participate in "idolatrous" Catholic rites, Dutch Calvinists, threatened by extreme reprisals, resolved to resist any ruler who opposed "true" religion.

While the Duke of Parma, Spanish governor in the Low Countries, reversed Calvinist gains in the Southern Low Countries, troops under the leadership of William of Orange, in league with Calvinist pirates, retook large parts of the Northern Provinces of the Low Countries between 1568

and the 1580s, motivated either by a commitment to Calvinism or by the desire to cast off Spanish tyranny. In 1579, the seven Northern Provinces declared themselves a separate republic independent from Spain, with Calvinism as their official religion. Although Catholics and Mennonites were also permitted to worship privately in most Dutch cities – Catholic religious services led by missionary priests trained at Cologne or Leuven were held discreetly in concealed churches – ongoing religious tensions destroyed William of Orange's hopes of political unity in the Northern Provinces. A dispute between those who maintained the classic Calvinist exposition of predestination and the followers of the theologian Jacob Harmenszoon (Arminius, 1560–1609), who emphasized the need for individual human cooperation in salvation, was settled in favor of the traditional Reformed view at the Synod of Dordrecht (or Dort, 1618).

Resentment of Calvinist violence in the Southern Low Countries bolstered support there for the Spanish, enabling the Duke of Parma to retake this area by 1585. As a result, post-Tridentine Catholicism was re-imposed vigorously in the Southern Low Countries through the promotion of education, the religious orders, and popular shrines. As a result, remaining Calvinists and Mennonites migrated north to the United Provinces. The pragmatic policy of toleration pursued by the Dutch government also allowed a space for immigrant Jewish and Socinian communities (see below). (Further, see Pettegree 2000, 344–364.)

Doctrinal Primitivism and the Reconfiguration of Christology and Trinitarian Theology

The impulse to restore Christianity to its primitive form led to the interrogation and rejection of many doctrines of the Catholic Church. While the magisterial reformers accepted the Christology and Trinitarian theology of the Catholic Church with little or no modification, radical theologians, at first mainly Anabaptists and Spiritualists, began in the 1520s and 1530s to question whether these apparently fundamental theological categories

were original constituent parts of Christian theology or later importations, for example, from Neoplatonism.

The distinguished Spanish physician and theologian Miguel Servet (Servetus, c. 1510–1553), impressed by Erasmus' radically historical and textual approach to the Bible and doctrine, called the traditional Nicene doctrine of the Trinity into doubt. He declared that the various names used for God in the Hebrew bible expressed various ways by which God was understood; the names of Son and Spirit in the New Testament simply expressed yet further ways. Servetus' dualism is essentially Gnostic. He was condemned by Catholics and Protestants alike and was finally executed as a heretic at Geneva, with Calvin's complicity.

The Italian physician and theologian Giorgio Biandrata (1516–1588) developed some of Servetus' ideas, such as his rejection of the eternal divinity of Christ. In 1556 he settled at Geneva, but after clashing with Calvin and Bullinger, he left Switzerland for Poland and then Hungary, where he convinced the prominent Calvinist minister Ferenc Dávid that the earliest Christian theologians were not Trinitarians but Unitarians. Unitarian Calvinism gained official recognition in Hungary in 1571, though a further schism within this church occurred when Dávid denied the propriety of worshipping Jesus; this, Dávid maintained, compromised the worship due solely to God the Father.

Perhaps the most influential antitrinitarian theologian was Fausto Sozzini (1539–1604), nephew of another radical, Lelio Sozzini (1525–1562). Lelio taught that the soul dies along with the body and that only the righteous are resurrected. In his *Brief Exposition of the First Chapter of John* (1561), Lelio drew on Erasmus's *Annotations on the New Testament* to argue that the *logos* of John 1:1 was not a preexistent divine being, Christ, but God's creative word (*sermo*). Christ was a man created in time, not from eternity, on whom God bestowed divine attributes. Reading his dead uncle's unpublished religious writings, notably the *Brief Exposition*, Fausto resolved to complete his unfinished theological project. Fausto travelled widely in Switzerland and Eastern Europe and was in contact with

Biandrata and Dávid, who published Lelio's *Brief Exposition* in 1568. In his work *On Jesus Christ the Savior* (1578), Fausto denied that Christ's death represented a satisfaction for our sins but emphasized the importance of faith in Christ, whom God made the head of the Church. Elsewhere he followed his uncle's controversial ideas about the mortality of the soul and resurrection. Fausto spent the final decades of his life in Poland, where he engaged in published theological debates with other theologians: Catholics, magisterial Protestants, and radicals alike. His closely argued treatises compelled his opponents to define their own positions more precisely.

The Polish Unitarian Brethren with whom Fausto associated established a religious haven at Raków, with church, school, and printing press. Here Fausto's followers compiled a catechism that drew heavily on his writings. This *Racovian Catechism* became an important document in British Unitarianism. After the Unitarian Polish Brethren were expelled from Poland in 1658, many settled in the United Provinces and Great Britain, from where some later travelled to the United States.

Confessionalization and Consensus

Following the official recognition of Lutheranism in the Peace of Augsburg (1555) and the Council of Trent (1545–1563), the Catholic, Lutheran, and Reformed churches on the continent sought to define and impose their own distinctive doctrines and consolidate their political power by securing the cooperation of temporal powers. This long process has been characterized as "confessionalization." After Luther's death in 1546, a rift opened between Philipp Melancthon, who had drawn up most of the formative documents of the Lutheran Church, and "genuine Lutherans" (or "Gnesiolutherans") such as Flacius Illyricus, who accused Melancthon of compromising Luther's message to appease his Catholic interlocutors. This dispute raged until the Formula of Concord was signed in 1577 to unite the warring parties. Lutheranism also lost ground when several German princes converted from Lutheranism to Calvinism in a "Second

Reformation.” Meanwhile, the Catholic Church in Germany was being revitalized, especially by the Jesuits. All churches sought to condense the essence of their distinctive beliefs in catechisms and sermons, but visitation records show that they often had difficulty in making message stick, especially in rural communities, where literacy was lower than in cities and where many medieval popular beliefs persisted.

Breakdown of the Consensus: The Thirty Years’ War

The delicate religious and political equilibrium between two power blocs within the Holy Roman Empire – the Protestant Union and the Catholic League – was disturbed by the election of Ferdinand II Habsburg as King of Bohemia in 1617 and as Holy Roman Emperor in 1619. Ferdinand, a Catholic zealot, set out to subjugate the Protestant powers through military force. At first the Catholic League won several decisive victories. In 1629 Calvinism was declared illegal, as it was not covered by the terms of the Peace of Augsburg. Catholic properties were reclaimed. The struggle became more complicated with the involvement of the Swedish and French armies. The war caused huge losses of life and property and severely diminished the political importance of both the Holy Roman Empire and the papacy, leaving France as the leading power in Europe. The conflict was finally stilled in 1648 with the Peace of Augsburg, a diplomatic settlement that held for more than 200 years. The increased autonomy enjoyed by local German princes after the war hindered any move towards national unification. (Further, see Pettegree [2000](#), 387–409.)

Some Philosophical Implications of the Reformation

Although the Reformation was motivated originally by theological and religious considerations, it soon drew in many issues with philosophical implications (Harrison [2007](#)). It also led to a

reevaluation of the work of Augustine, whose work exercised a fascination on figures as different as Luther, Calvin, Descartes, Pascal, and Malebranche.

Luther’s dissent raised questions of authority which combined with an incipient skepticism about the claims of the Church to create a broad crisis of authority. It has been suggested that this crisis led many philosophers to demand greater epistemological certainty. Furthermore, the need to articulate new systems of belief raised questions of method and the organization of knowledge. It has also been suggested that the Protestant emphasis on the literal meaning of Scripture and on divine voluntarism contributed to the rise of empiricism in natural philosophy. If human morality depends on divine will rather than inherent qualities, why should not also physical laws? Such laws, some argued, cannot be determined through reasonable argument but must be investigated experimentally. For example, some considered the corpuscular theory of matter consistent with voluntarism, since the motion of particles is caused by the activity of the divine will on matter. There are also interesting affinities between the way Protestant reformers minimized individual virtue in justification and the way many early modern natural philosophers minimized material virtues in their explanations of physical processes. Both groups believed that causation rests not in the inherent qualities of human actors or physical substances but in the divine will. Furthermore, the Protestant reformers’ insistence that the age of miracles was past and their reduction of the number of sacraments to two or three (baptism, Eucharist, and sometimes confession) may have contributed to a diminished sense of the supernatural and a desire to find natural explanations for natural phenomena. The Protestant rejection of allegorical readings of Scripture in favor of a literal reading also affected the ways in which Protestant natural philosophers read the Book of Nature. No longer were natural things considered sacred symbols of a higher reality; rather, they were to be understood in natural terms. The Protestant tendency to believe that God had placed natural things in the world for human use may have led to a greater willingness to exploit nature.

The reformers also developed new ideas about the individual. Luther's insistence on the right of individual resistance soon spilled into the political realm in ways he did not foresee. Luther's struggle with Erasmus hinged largely on the question of free will, which Erasmus defended and Luther denied. The emphasis on predestination in the writings of Calvin and his followers raised questions of individual responsibility.

The Reformation also affected ideas about society. At first, many understood Luther as advocating antinomianism. The fragmentation of religious identities in the Reformation forced states to reconsider how to deal with those who held different beliefs, whether at home or abroad, and thus catalyzed discussions of toleration more generally. Max Weber controversially suggested that the high value placed on manual labor by the reformers led to the "Protestant work ethic" and the beginnings of capitalism. The rejection of ecclesiastical authority in the Reformation and the emphasis on individual conscience seem also to have contributed to the rise of libertarianism.

Regiomontanus, Johannes

Born: June 6, 1436, Königsberg

Died: Early summer in 1476, Rome?

Renzo Baldasso

Arizona State University, Tempe, AZ, USA

Abstract

Regiomontanus is the most important astronomer and mathematician of the fifteenth century. An early mathematical humanist, he was committed to the recovery of ancient science and mathematics, publishing corrected texts inclusive of figures.

Alternate Names

[de Monte Regio, Johannes](#); [Müller von Königsberg, Johannes](#)

Biography

The information about Regiomontanus's life is fragmentary, but the key achievements, appointments, and geographic moves are the following. Born in Königsberg in 1436, Regiomontanus studied first at the university of Leipzig and then Vienna where he completed his bachelor in 1452. In 1453–1454, he studied with Georg Peurbach, becoming his protégé while also

earning the title of *magister artium* in November 1457 and teaching courses on optics and Euclid. In 1460 they met Cardinal Bessarion who invited them to follow him to Rome – Peurbach died in April 1461. As a member of the cardinal's entourage and household, Regiomontanus spent also time in Venice, Ferrara, and Padua; in Rome he was assigned a benefice through the Wurzburg diocese. In Italy, Regiomontanus had the opportunity to master Greek and study Byzantine manuscripts, partaking of humanist elites and engaging also Leon Battista Alberti, Paolo dal Pozzo Toscanelli, Nicholas of Cusa, and Theodore of Gaza among others. From these years survive epistolary exchanges with Giovanni Bianchini and Jacob Speier, leading astronomers in Italy. In the summer of 1467, he accepted the *magister* appointment in Budapest at the university founded by Matthias Corvinus, king of Hungary and Bohemia. By the summer of 1471, Regiomontanus relocated to Nuremberg, becoming a citizen in November. There he organized a printing house, publishing seven titles from 1473 to 1475, years in which he traveled to Rome where Pope Sixtus IV bestowed him two more benefices. The last recorded information dates from May 1476; likely Regiomontanus died in Rome later that summer.

Heritage and Rupture with the Tradition/Innovative and Original Aspects

In his *oration*, likely composed in 1464 as the introductory lecture for the astronomy course Regiomontanus was going to teach at the University of Padua, he argued for mathematics as one of the three branches of knowledge together with metaphysics and natural philosophy and the only one endowed with certainty in its claims (position rearticulated in the dedication of the *Tabulae primi mobilis*). After outlining the history of mathematics – in which he also identified Diophantus as the father of algebra (instead of al-Khwarizmi or Fibonacci) – and praising the usefulness of its applications including astronomy, Regiomontanus criticized

the intellectual tradition that had disregarded it, underscoring that mathematics is instead a fundamental discipline that should be mastered by all intellectuals.

Though extant in manuscript form only, Regiomontanus's *Defence of Theon against George of Trebizond*, which he worked for years (to 1473 at least), include the best evidence of his interest in physical astronomy, including his commitment to three-dimensional spheres rather than two-dimensional circles apt for saving the phenomena in the spirit of Ptolemy.

Impact and Legacy

The accuracy of Regiomontanus's technical work in astronomy and mathematics and editing ancient texts, including the *Epitome in Almagestum Ptolemaei* (begun by Peurbach and printed in 1496) and the creation of new tables (projecting planetary positions through 1504), was unmatched in the fifteenth century, amply justifying the contemporary title of "prince of astronomers of our age" – this body of work created the conditions in which Copernicus developed heliocentric cosmology. However, the impact of Regiomontanus's publications was perhaps greater. He understood that printing was the means to implement a transformation in the scientific culture. His editorial program, advertised in a broadside, lists 44 titles, ranging from his own *Kalendarium* and Peurbach's *Theorica* to the works of Ptolemy, Euclid, and Archimedes; together they would have offered all of the foundational works of mathematics and astronomy, in new translations and with figures accompanying the texts. Text revisions during press work, figures printed from woodblocks and metal imprints, and extensive in-house hand-finishing underscore Regiomontanus's commitment to produce finished books and precise texts, setting an example for other printers. The employment of Roman types and large initials blocks (copied from those appearing in publications by Sweynheym and Pannartz) connect graphically Regiomontanus's books to Rome and Roman humanism.

Reisch, Gregor

Born: 1467, Balingen (Schwarzwald)

Died: 9 May 1525, Freiburg (Breisgau)

Tomáš Nejeschleba

Centre for Renaissance Texts, Department of Philosophy, Faculty of Arts, Palacky University Olomouc, Olomouc, Czech Republic

Abstract

Gregor Reisch was a Carthusian prior and confessor to the Emperor Maximilian I. In 1503, in Freiburg he published a book entitled *Margarita philosophica* (*Philosophical Pearl*) which provides an introduction to the liberal arts and philosophy. *Margarita philosophica* follows the Aristotelian pattern of philosophy as was typical for medieval textbooks and covers a wide range of topics, not only the *trivium* and *quadrivium* but also the traditional branches of philosophy, i.e., logic, metaphysics, natural philosophy, and moral philosophy. Reisch's *Philosophical Pearl* contains many instructive woodcuts and was often used as a textbook at universities, in Northern Europe in particular. It was reprinted many times during the sixteenth century and became one of the most influential books of that period.

Alternate Names

[de Reycho](#); [Reysch, Georgius](#); [Reitschius](#); [Reyst](#); [Rieschius](#); [Rusch de Balingen](#)

Biography

Gregor Reisch was born in Balingen and studied as a clergyman of the Diocese of Constance at the university in Freiburg. He obtained his bachelor and master degree there and became a tutor at the university in Ingolstadt in 1494. In 1496, Reisch entered the Carthusian order in Freiburg (Breisgau). In 1501, he was nominated a prior in

the monastery of Buxheim and in 1502 was ordained a prior in Freiburg. In the same year, Reisch was appointed as a visitor of the Carthusian order for the Upper Rhenish Province. As a member of the General Chapter of the Carthusian Order, Reisch participated in the work on the new Rules of the Order, which were published under his supervision in 1510. Reisch was also the editor of the *Works of St. Jerome* for Johan Amerbach's printing shop, in which from 1513 was continued by Erasmus of Rotterdam with great praise for his predecessor. In 1510, Reisch became a confessor to the Emperor Maximilian I (Srbik 1961). In 1523, a stroke left him partly paralyzed and he died in 1525, in the middle of the German Peasants' War during the evacuation of the Freiburg monastery (Andreini 1997; Srbik 1941; Münzel 1938).

Margarita Philosophica

Margarita philosophica was written around 1496 and was published in 1503 (Reisch 2002). Reisch uses ideas from many different sources, from classical tradition, early Christian writers, medieval Arabic philosophers, and Latin writers of the thirteenth and fourteenth century; his work thus reflects late medieval knowledge with a certain influence from humanism and Renaissance philosophy. *Philosophical Pearl* was later called the first encyclopedia from the German-speaking region (Becker 1970), but it is rather a compendium of philosophy, i.e., more of a reduction of philosophy as taught at universities than an encyclopedia in the modern sense (Cunningham and Kusukawa 2010). Reisch follows the tradition of the seven liberal arts and the Aristotelian division of philosophy into theoretical and practical. He begins with the *trivium* of "rational philosophy" (grammar, logic, rhetoric) and *quadrivium* of "real philosophy" (arithmetic, music, geometry, and astronomy). Following that, four books on natural philosophy are included involving psychology (Park 2008), and *Margarita philosophica* is concluded by a book on moral philosophy (Kraye 2008). Reisch's philosophy was created in the context of a spiritual

movement called "The Modern Devotion" and is based on Aristotelian grounds with a strong influence of pseudo-Dionysius' light metaphysics and Augustinian thought in regard to the distinction between Creator and creation (Cunningham and Kusukawa 2010).

Legacy

Gregor Reisch's *Margarita philosophica* was republished during the sixteenth century at least ten times (Ferguson 1929). Certain editions were not authorized, and some of them were supplemented by different appendices not originating from Reisch. The *Philosophical Pearl* was used as a textbook at universities in Northern Europe in the time before Reformation and afterward particularly in Catholic regions. The allegorical woodcuts and a number of detailed illustrations which supplemented the text also helped the popularity of the book for teaching purposes. In 1599, it was translated into Italian. In the 1583 edition and in the Italian edition, it was first titled as an encyclopedia (cyclopedia). From the seventeenth century on, its influence descended rapidly, but *Margarita philosophica* was still positively assessed by Alexander von Humboldt for its significance for the expansion of mathematical and natural philosophical knowledge.

Reuchlin, Johannes

Born: 22 February 1455

Died: 30 June 1522

Saverio Campanini

Alma Mater Studiorum, Università di Bologna, Bologna, Italy

Abstract

Johannes Reuchlin, German humanist, diplomat, and Hebraist, is one of the fathers of German humanism; he was also a pioneering figure of Jewish studies in the Christian world and is remembered as the most prominent figure of the intellectual and spiritual movement known as Christian Kabbalah, founded by the Italian humanist Giovanni Pico della Mirandola. The most momentous event of his career was his involvement in the “Battle of the Books” from the year 1509 to his death. Reuchlin was consulted by the emperor in order to produce a legal advice to justify the destruction of all the books in Jewish hands, with the exception of the Bible. He took a courageous stand opposing the campaign of undifferentiated persecution of the Jewish literature, suggesting that this literary corpus should rather be studied before any censorship could take place. On the occasion, he produced, almost incidentally, the first history and systematical outline of Jewish postbiblical literature. Moreover, he had already published a Hebrew grammar and a dictionary (1506), the first one of this scope in Latin in order to allow the Christians to get acquainted with the original text of the Bible and with later Jewish exegetical literature. The core of his intellectual interest, though, was the mystical literature of the Kabbalah, which forms the focus of his two most important works: *De verbo mirifico* (1494) and *De arte cabalistica* (1517), both in the form of Platonic dialogues showing that the doctrines and the methods of Kabbalah were in the best position to demonstrate the truth of Christian faith. His intellectual and religious

endeavors, especially the fight against scholasticism, the critique of the Vulgate, and the advocacy of the superior value of the Hebrew original of the Old Testament, can be seen as leading to Protestant Reformation, but, since he refused to adhere to Luther's reform movement, he is best described as a genuine humanist of the period preceding Reformation, whose function as a precursor could be vindicated by different trends of the European intellectual panorama of the subsequent generations.

Alternate Names

Capnion

Biography

Born to Georg and Elisabeth Eck in Pforzheim (Baden) on 22 February 1455, Johannes Reuchlin studied in Freiburg, Basle, Orléans, and Poitiers where he obtained his title of *Magister Artium* in 1481. Afterwards he was at the service of Duke Eberhard of Württemberg with whom he visited Italy in 1482. In Florence, he met Lorenzo de Medici and some prominent humanists: Angelo Poliziano, Cristoforo Landino, and Giorgio Merula. In Rome, he was instructed in Greek, after a first training in Paris with Hermonymos of Sparta and with Johannes Argyropulos. In 1490, he traveled again to Florence, meeting Giovanni Pico della Mirandola, and to Rome, where he met his acquaintance Ermolao Barbaro. In 1492, at the imperial court of Linz, he deepened his knowledge of Hebrew under the guidance of the physician of the Emperor Maximilian of Habsburg, Jacob Yehiel Loans. Due to the protection of the bishop of Worms, Johannes von Dalberg, Reuchlin was introduced to the circle of the humanists of Heidelberg: Johannes Trithem, Willibald Pirckheimer, Ulrich Zasius, and Jacob Wimpfeling. In 1498, he accompanied the Elector Palatine, Count Philipp to Rome, where he pleaded before Pope Alexander VI. During his stay in Rome, which lasted a few months, he

acquired many precious Hebrew books and studied under the guidance of Obadiah Sforno, philosopher and exegete. In 1500, he was appointed triumvir of the Swabian League and switched from the diplomatic to the juridical career. As an expert on Hebrew literature, he was consulted in 1509 by the baptized Jew Johannes Pfefferkorn who, with the support of the Dominicans of Cologne, was campaigning for the destruction of all the books (with the sole exception of the Bible) in the possession of the Jews living in the imperial territories. He was among the consultants of the emperor, who collected expert opinions in order to proceed with the campaign initiated by Pfefferkorn but his *Gutachten* was decidedly against the undifferentiated destruction of Jewish literature. This courageous decision (together with some imprudence in his polemical language) brought to a long series of processes and to his final condemnation in 1520. Only after his death Reuchlin was rehabilitated. In 1520, he was appointed as an instructor of Greek and Hebrew at the University of Ingolstadt. He taught the same subjects at the University of Tübingen in the winter (1521–1522). Reuchlin died in Stuttgart on 30 June 1522.

Principal works: *Vocabularius breviloquus* (1478), *De verbo mirifico* (1494), *Scaenica progymnasmata* (Henno, 1498), *Oratio ad Alexandrum VI pro Philippo Bavariae Duce* (1498), *Sergius vel Capitis caput* (1504), *Liber congestorum de arte praedicandi* (1504), *Tütsch Missive warumb die Juden in ellend sind* (1505), *De rudimentis hebraicis* (1506), *Augenspiegel* (1511), *In septem psalmos poenitentiales hebraicos interpretatio* (1512), *Defensio Johannis Reuchlin Pforcensis LL. Doctoris contra calumniatores suos Colonienses* (1513), *De arte cabalistica* (1517), and *De accentibus et orthographia linguae hebraicae* (1518).

Translations: Hippocratis, *De praeparatione hominis* (1510); Joseph Ezobi, *Lanx argentea* (1512); Athanasii, *Epistula ad Marcellinum in interpretationem psalmorum* (1515); and Athanasii, *De variis quaestionibus* (1515).

Editions: *Clarorum virorum Epistolae* (1514); *Illustrium virorum Epistolae* (1519); Xenophontis *Apologia Socratis, Agesilaus, Hieron* (1529); and

Greciae excellentium oratorum Aeschinis et Demosthenis orationes adversariae (1522).

Johannes Reuchlin, though distinguished in many fields, was not a philosopher in the professional meaning of the word nor in any metaphorical sense. Nonetheless, he deserves an enduring place in the hall of fame of Renaissance thought for at least three reasons: the rediscovery of Hebrew, Jewish literature, and Kabbalah for a Christian readership. Reuchlin was not merely a faithful pupil of Giovanni Pico della Mirandola: in his footsteps, he had the ambition to complete Pico's only sketched project to win Jewish Kabbalah for the humanist movement. His first essay of considerable extent was the dialogue among three interlocutors bearing the title *De verbo mirifico* (1494). It contains already, although in a less developed form, all the essential themes of the literary production of the mature Reuchlin, who had a considerable evolution but maintained his fundamental attitude and the intuitions of his younger years. Deeply persuaded of the values and the stylistic paradigms of Italian Humanism, Reuchlin sought, already in this early "kabbalistic" work, to fill with a tangible meaning the rapid allusions of the *Conclusiones* (1486) by Giovanni Pico della Mirandola. On the basis of a still quite primitive knowledge of Hebrew, Reuchlin attempted the construction of a discursive model which could explain some kabbalistic theses of the Mirandulan. He focused his discussion on the typically humanistic persuasion of the centrality of the "word" (*verbum*), and he tried to apply it to Christianity, explaining that the most powerful word, the wonder-working utterance, is the name of Jesus. One of the most contested theses of the Mirandulan, pointed to magic, together with Kabbalah, as the principal disciplines which would prove the divinity of Christ. Reuchlin interprets this conclusion, avoiding the theologically problematic black magic, as a reference to the efficiency of the Word, combining the virtues of the evangelical Logos with the power of the Hebrew biblical Name. Jesus' name represents thus a progress, granted by God's mercifulness, in comparison to the ineffable Tetragramm, toward the

redemption of the entire humanity. By inserting an S into the Tetragramm, the name IHSUH is obtained, which makes the divine name pronounceable, actualizing its power for the believers in Jesus, as if the real name of the Savior would be revealed or rediscovered after centuries of oblivion. It would be far from correct, however, to reduce Reuchlin's discovery to the magical dimension of the knowledge of the true name of Jesus. His most original contribution was rather, following Pico's lead, to be sought in the worship of the divine word and in the development of the exegetical methods allowing a Jewish confirmation of Christianity. The very structure of the *De verbo mirifico*, as well as in the later *De arte cabalistica*, serves precisely the apologetic function of letting truth emerge after and beyond the choices and the interests of the participating voices: the Epicurean philosopher Sidonius, not by chance at the center of the first book (of the three making up the work), represents the philosophical option, the lowest, but characterized by the curiosity which leads to unqualified "religion," interpreted in the second book by the Jew Baruchias, whose function is to interpret Judaism, but in a new form, not structured according to the traditional stereotypes of stubbornness, obstinacy, and blindness, but as the heir to a venerable tradition which potentially contains the highest truth and can access ultimate salvation, provided that it accepts Jesus as the solution of every enigma. The protagonist of the third book is Capnion, bearing the humanist Latinized name of Johannes Reuchlin himself (imagined as derived from "Rauch," smoke, through a diminutive of the Greek "kapnos" with the same meaning). He combined the philosophical curiosity of the first interlocutor with the religious tradition of the second, offering the definitive synthesis of Christianity, understood as perfect realization and ultimate answer to the questions of the philosopher as well as to the obscure intricacies of kabbalistic tradition. Reuchlin's Christianity is the focus toward which all sincere aspirations to truth converge, in other words his is a pious philosophy, striving to achieve the confirmation of Christianity through kabbalistic methods. Shortly after Pico

had been rehabilitated from the accusations of heresy by Pope Alexander VI in 1493, Reuchlin revives some suggestions of the theses, in particular the idea that the name of Jesus, which actually was for Pico Yeshu, in accordance with the Jewish tradition, containing a Shin (S), was in itself the kabbalistic proof of the Christian dogma of Jesus' humanity and divinity. Now, since the public discussion of the theses had been prohibited and Pico had received a formal interdiction to explain himself, Reuchlin advances his own conjectures, creating a new blend of Christian Kabbalah, not only interpreting Pico but also presenting an innovative and creative approach to Pico's slogans, with a rather peculiar "German" bent, since Nicolaus Cusanus had suggested, in one of his sermons, the idea that the letter S, peculiar of Jesus' name, could make pronounceable the ineffable Tetragrammaton. The book, quoted with respect to Jacques Lefèvre d'Étaples, in his *Psalterium Quincuplex*, established Reuchlin, way beyond his real merits, as one of the foremost experts of Hebrew literature, in particular of its most recondite meanders, which were becoming, at the beginning of the XVI century, object of a growing curiosity among the Christians as a possible way of neutralizing the neopagan inclination of the humanist movement. Hebrew, as a language and as a "forgotten" tradition to be rediscovered in the "*ad fontes*" humanistic race, remained at the center of Reuchlin's interests and publishing activity, becoming the cause of his glory but also of his judiciary suffering. The reactions of the readers to *De verbo mirifico*, documented by the correspondence, show clearly that his essay found a largely benevolent and remarkably curious readership but the majority could not grasp thoroughly his intentions, due to technical problems, since the Basle edition did not have Hebrew fonts, and also due to his intentional esotericism in tone. Reuchlin gave only partial explanations of the divine names hidden in the verses of the Psalms symbolizing the *Shem ha-Meforash*, the explicit and miraculous name of God, making prayer effective through the intercession of the angels. He understood very

well that, in order to realize his project of Christianizing the Kabbalah, two preliminary conditions had to be fulfilled. On the one hand, his knowledge of Hebrew and his Hebrew library needed to be significantly enriched. Moreover, the knowledge of Hebrew of his readers had also to be improved since his kabbalistic reasoning in Latin translation makes almost no sense at all. In order to achieve this ambitious double target, he went first to Rome, where he took lessons of Hebrew at an advanced level from Obadiah Sforza and he enriched enormously his Hebrew library. Then, in 1506, he published the first (if one excepts the modest primer written by Konrad Pellikan, which appeared two years earlier) systematic grammar of the Hebrew language in Latin with a pioneering dictionary, the *De rudimentis hebraicis*, supplemented, twelve years later, by the *De accentibus et orthographia linguae Hebraicae* (1518): the basic tools for teaching Hebrew at the university level were thus laid. The vicissitudes, on the other hand, were caused by the very same emergence of Reuchlin as the outstanding expert for Hebrew literature among the Christians. The vast campaign of persecution of Hebrew literature promoted by the convert Johannes Pfefferkorn found a benevolent ear in Emperor Maximilian I, who supported it under certain conditions: he most certainly saw in it an occasion to refill the imperial treasure, impoverished by continuous military campaigns, with the perspective of the fines which would ensue from a generalized seizure of books in the possession of the Jews in the Holy Roman territories. As a matter of course, his objective could not have been the undifferentiated destruction of the totality of these books, which was favored by the convert and the watchdogs of the orthodoxy and would have led to their unmitigated triumph, but which at the same time would have had no significant "outcomes" from a more material, strictly fiscal point of view. Reuchlin's expert opinion on this delicate matter could not have been ignored and, as it is well known, it was decidedly negative. Although favorable to the censorship and control, especially of blasphemous books and libels against Christianity,

such as the notorious *Sefer Nizzahon Yashan* and *Toledot Yeshu*, Reuchlin was sternly opposed to an indiscriminate destruction of the Jewish books. He was rather inclined to consider them, with few exceptions, and with different degrees, a most precious potential asset for the Christians, not only nor primarily as an apologetic tool for inducing conversion, but in order to retrieve the forgotten Jewish root of Christianity and, in perspective, to complete with Hebrew an ideal triad of humanistic languages associating with the already established Latin and Greek. Reuchlin's advice, although quite isolated and bitterly opposed by the suspicious Dominicans, happened to coincide with the imperial interests and prevailed, although only in the judicial matter of the seized Hebrew books. The quick formation of two parties the Reuchlinists and the so-called Obscurantists (the latter name, derived from the pro-Reuchlin satire *Epistulae obscurorum virorum*) started to delineate the front lines which will soon divide the German lands on the much more explosive theme of the reformation of the Church. The massive usage of the press, with the publication and capillary diffusion of pamphlets, satires, flyers, etc., shows clearly the new dimensions of the debate, which, such as in the case of Ulrich von Hutten, went quickly far beyond the original frame. The personal, decidedly slanderous confrontation with Pfefferkorn was certainly the immediate cause for Reuchlin's ultimate condemnation in 1520, but it is evident that the general context of unease in the Church, the first breaks in Christianity, and the dangerous extension of the terms of the discussion convinced the Pope and the Cardinals of the necessity of an exemplary punishment. One element deserves a special mention, since it forms the most important legacy of Reuchlin's argument, first in defense of the Jewish books and then in self-defense, is his strictly juridical argument, even more solid (in principle) than the cultural appeal held in the most general terms, according to which Jewish books are an intellectual heritage of importance for the Christians too. Juridically, Reuchlin argues that since Emperor Caracalla's edict, the Jews are fellow citizens (*concives*), and they

share with the Christians, in front of the secular power, the same rights: among others the right to see their property respected, as long as it is not demonstrated that they host in their libraries libels or blasphemous books. Within this frame, Christian-Jewish relations could find, in Reuchlin's vision, a new dimension. From a theological point of view, in fact, he did not differ very much from his Dominican opponents, but on a juridical basis, Reuchlin identified a possible common ground on which cultural exchanges would be mutually beneficial. With the publication of the *De arte cabalistica* (1517), Reuchlin reached the apex of his intellectual development and could reap the fruits of his patient strategy which, almost incidentally, constituted the foundation of modern Jewish studies. Once again a dialogue among three interlocutors, in this later work, there is no representative of the author's voice and not even a voice representing explicitly Christianity. The three participants represent each a philosophical or religious position: from the Pythagorean Philolaos to the eclectic, singular figure of baptized Moslem, bearing the curious name of Marranus, to the authentic protagonist of the dialogue: Simon, the Jewish Kabbalist who, in the heat of the debate, appears inadvertent of the fact that, while explaining methods, techniques, and contents of kabbalistic wisdom, he is delivering the key to discover and understand the true name of Jesus according to Kabbalah. At odds with the *De verbo mirifico*, anyway, the later dialogue presents a massive usage of kabbalistic texts (or of medieval Jewish texts, such as the *Guide of the Perplexed* which, in accord with Pico della Mirandola who in turn followed Abraham Abulafia, Reuchlin ascribed to the core of Kabbalah), in the original Hebrew and in Latin translation. The consistent practice of analogy to establish vast resemblances between Christianity and Judaism, the delineation of the contents of a "perennial philosophy," and the sustained polemics against scholasticism in favor of a Platonic, Dionysian, and Cusanian hermeneutics make Reuchlin the principal exponent of the transplantation of Florentine humanism with some corrections, inspired by Pico in the German intellectual climate. Reformation and the religious

struggles which will soon tear apart Germany and the Christian west will rapidly destroy his project of religious and intellectual renewal, whereas his enthusiasm for Kabbalah, the key, in his conception, to reconstruct the lost Pythagorean mysteriosophy, will wreck in the XVII century, under the attack of critical philology (showing that the supposed antiquity of kabbalistic doctrines was largely fictitious), a discipline he himself had contributed to establish with his bibliographic rigor and with his determination in reaching the authentic sources of the Christian synthesis, especially the Jewish ones. Nevertheless, it was Reuchlin, far more than Pico, the true father of modern Jewish studies, who established the knowledge of Hebrew as the precondition for any serious study of Judaism and as a peculiar intellectual interest for Christians. Moreover, his name will always be mentioned whenever there will be the need for a plaidoyer in favor of civil coexistence between Jews and Christians and also whenever, as it is periodically the case, one will want to understand Jewish esoteric tradition and the uncanny family resemblance it evokes among the Christians in an almost irresistible way, be it as repulsion or as powerful fascination.

Rheticus, Georg Joachim

Born: 16 February 1514

Died: 4 December 1574

Dennis Danielson

Department of English, University of British Columbia, Vancouver, BC, Canada

Abstract

Rheticus (b. Feldkirch, 1514) in his early twenties became a professor at the University of Wittenberg, where Philipp Melanchthon declared he “was born to the study of mathematics.” In 1539, having heard rumors of a new sun-centered cosmology, he sought out the elderly, little-known astronomer Nicolaus Copernicus in Frauenburg (Frombork), remaining there for two and a half years. In 1540 Rheticus published his own first account (*Narratio prima*) of Copernicus’s cosmology, according to which earth is a planet rotating on its axis and revolving annually about a central sun. He later delivered Copernicus’s manuscript of *De revolutionibus* to Nuremberg, where it was published in 1543.

After the death of Copernicus, Rheticus served as the “apostle” of heliocentrism, developing mathematical tools to aid its hoped-for confirmation. His 1551 *Canon doctrinae triangulorum* contained the first tables of all six trigonometric functions, and his much larger (posthumous) *Opus Palatinum de Triangulis* (1596) fathered generations of trig tables not superseded until the twentieth century.

Rheticus’s impact was principally in astronomy and in closely related areas of mathematics. His theologically grounded belief in “God’s geometry in heaven and on earth”

supported his realism about the philosophical truth status of Copernicanism and a rejection of the instrumentalism according to which astronomy’s claims (in Andreas Osiander’s words) “need not be true nor even probable.”

Biography

Rheticus was the son of Georg Iserin, the town doctor of Feldkirch. He enjoyed a humanistic grammar-school education in Feldkirch and in Zürich, then a center of Swiss Protestantism. In 1532 he enrolled at Martin Luther’s University of Wittenberg, becoming a protégé of the Reformer Philipp Melanchthon (who wrote that Rheticus “was born to the study of mathematics”; Danielson 2006, 24). He became a professor there in 1536, and in May 1539, having heard rumors of a new sun-centered cosmological theory, he journeyed to Frauenburg (Frombork), where the elderly amateur astronomer Nicolaus Copernicus served as canon, administrator, and doctor. Rheticus stayed with Copernicus for two and a half years, encouraging the completion of the astronomer’s great heliocentric treatise, *De revolutionibus*. In 1540 he published his own first account (*Narratio prima*) of Copernicus’s cosmology, according to which earth is a planet rotating on its axis and revolving annually about a central sun. And in the autumn of 1541, he left Frauenburg with the finished manuscript of Copernicus’s work, carrying it first to Wittenberg and then to Nuremberg, where it was published in 1543.

In the decades following the death of Copernicus that same year, Rheticus served as principal “apostle” and defender of his master’s cosmology. Although his own career was impeded by restlessness, distraction, and ill fortune (he spent time in Wittenberg, Milan, Switzerland, Leipzig, Prague, Krakow, and Košice), Rheticus strove to refine – and provide computational tools for – the astronomically essential “science of triangles” later known as trigonometry. In 1551 he produced and published *Canon doctrinae triangulorum*, containing the first ever tables of all six

trigonometric functions – to which was appended a dialogue announcing that Rheticus was delivering “fruit from the most delightful gardens of Copernicus” (Danielson 2006 143). Later, during twelve of his years spent in Krakow, and while working as a physician so that he could pay the bills, he employed five computers – human assistants performing computations – to calculate ever more accurate results for his trig tables. In 1574, an eager student from Wittenberg, Valentin Otho, discovered the 1551 *Canon* and traveled to Košice to learn more from Rheticus. Although Rheticus died in his arms late that year, Otho pressed on with the trigonometry project and in 1596 published his and Rheticus’s work – almost 1500 folio pages, mainly in tabular form, roughly a hundred thousand ratios calculated to at least ten decimal places – as *Opus Palatinum de Triangulis*. Despite its manifold errors, this work formed the foundation for Bartholomew Pitiscus’s *Mathematical Treasury: or Canon of Sines* (Frankfurt, 1613), and thus fathered generations of tables only superseded in the twentieth century.

Rheticus’s impact was thus principally in astronomy (as impresario of the cosmology of Copernicus) and in the closely related field of mathematics. His work was undergirded by the conviction that mathematics – particularly geometry and its offspring trigonometry – could serve to produce real knowledge about both geophysics and astrophysics. His theologically grounded belief in “God’s geometry in heaven and on earth” (Burmeister 1968, 3:139) in turn produced a realism about the philosophical truth status of astronomical claims and a rejection of the instrumentalism according to which astronomy’s task was merely to “save the appearances.” This instrumentalist position was asserted by Andreas Osiander’s notorious unsigned preface to *De revolutionibus* alleging that astronomers offer merely a hypothetical “basis of computation” that “need not be true nor even probable.” In printed copies of *De revolutionibus* that came into the hands of Rheticus, he angrily defaced Osiander’s unauthorized preface (Danielson 2006, 109–112).

Methodologically, Rheticus is notable for his commitment to both observation and mathematical analysis combined with a rejection of

dogmatism. According to him, scientific obscurity should be tackled “by means of inquiry, not assertion” (*non affirmando, sed quaerendo*). Although he could not prove Copernican heliocentrism, his conviction concerning its philosophical verifiability – in addition to his heroic achievements in discovering, publicizing, and supporting Copernicanism – formed a significant component of the cosmological revolution whose later and more famous champions were Kepler, Galileo, and Newton.

Rhetoric in the Renaissance

Fosca Mariani Zini

University of Tours, Tours, France

Supérieures de la Renaissance, Université

François Rabelais, Tours, France

Abstract

The rise of rhetoric during the Renaissance depends, first and foremost, on a social condition: the development of new city-dwelling and cultivated middleclass produced the requirement of devising an art of argumentation, appropriate to resolving the conflicts of the political, juridical, moral, and economic life, in a word, of the life of *negotia* (practical affairs). Consequently, Humanists consider that the art of rhetoric must enter in competition with the dialectic of medieval universities, since it must resolve the controversies of any disputed subject, which implies and plausible conclusions. The vicissitudes of rhetoric during the Renaissance can be described as the attempt to decompose and to recompose, in manifold manners, the functions of rhetoric and of the dialectic in unprecedented figures of argumentation (Vasoli 1964; Seigel 1968; Murphy 1983; Witt 2000; Green and Murphy 2006). On the one hand, rhetoric developed the function of eloquence, in order to persuade the public. The goal was to elaborate an effective discourse more than a plausible one. On the other hand, humanists attempted to recompose the functions of rhetoric and of the dialectic in a topical art of argumentation.

Heritage and Rupture with the Tradition

The rise of rhetoric during the Renaissance depends on a social condition: the development of new cultivated groups (merchants, bankers, lawyers, and all sorts of public figures) produced the requirement of inventing an art of argumentation, appropriate to regulating discussions and

resolving the conflicts of political, juridical, moral, and economic life, in a word, of the life of *negotia* (the practical affairs). It is true, however, that in the municipal Middle Ages, such a requirement had already been maintained, and translated itself by the development of the *artes dictaminis*, namely, a simplified form of the rhetoric for the writing of public letters. This art responded to the formation of civil servants in a situation of political decentralization and raised the status of the administrative class thanks to the prestige of elocution. So, the close connection between rhetorical study, the notarial art, and the interest in legal studies was an important feature of the Latin culture between the ninth century and the fourteenth century.

But does this aspect also characterize the conception of rhetoric in the Renaissance? Or is there in this field a certain continuity between the Middle Ages and Humanism?

Interpretations are often conflicting, but to respond appropriately, the fields of application of rhetoric and its purposes must first be determined. The schools of grammar taught not only the ability to read and to write Latin, but also literary criticism, metrics, and rhetoric. Moreover, any social relationship needs in the *vita activa* the mastery of eloquence. So, it can be said that humanists developed the *artes dictaminis* and the rhetorical skills of grammar, even more when the birth of vernaculars led to the transformation of rhetoric into linguistic analysis. This is certainly an aspect of continuity: one can think for example to Niccolò Perotti's *Rudimenta grammatices*, (1474) or Joachim Du Bellay's *Défense et illustration de la langue française* (1549) and Angel May (English Secretaries... (1586). But the praise of language both as a tool of virtue and a correct expression of the thought made consequently of rhetoric an essential element of man's education as an intelligent virtuous being, who is in essence a friend of other human beings. Such an education is provided by the imitation of Latin poetry (first, with Lovato Lovati in the second half of the thirteenth century, then with Petrarca in the mid-fourteenth century). However, the turning point was the teaching of rhetoric in Padua of Giovanni Malpaghini of Ravenna (1382–1405) who was

succeeded by Gasparino Barzizza. Still in Padua, Pier Paolo Vergerio proclaimed in his *De ingenuis moribus et liberalibus studiis* (1402–1403) that moral philosophy, rhetoric, and knowledge of Latin letters, are essential elements for the social and individual education of a good man. The universal educational function of rhetoric and the study of ancient culture was the belief that led Guarino Guarino at Ferrara and Vittorino of Feltre at Mantua to found schools where philosophy, history, Greek and Latin literature, rhetoric, and poetry stood at the center of curriculum.

If the educational function of rhetoric is an original aspect of humanism, the principally political conception of eloquence is another significant one. In fact, while medieval schools were in the forefront of the legal documentary culture, the humanist schools emphasized the link between the political discussion and the effectiveness of rhetoric. Cicero was established as the model of the rhetoric anchored in real life not only through his works, but also through his own life, as a lawyer and citizen engaged in politics, desperately struggling in order to keep alive the Roman republic against Caesar's tyrannical temptations. Therefore, eloquence was placed at the service of freedom (see Coluccio Salutati, *De tyranno*, 1400) or of parliamentary debate, as in the schools created by Elizabeth I (inspired by Sir Thomas Eliot, *The Governor*, 1531). Humanists considered that the art of rhetoric must enter into competition with the dialectic of medieval universities, since it did not limit itself to teaching discursive strategies for civil servants, but must resolve the controversies of any disputed subject, which only deduces plausible conclusions. Nevertheless, the criticisms of the universities' dialectics depend in part on an attempt of auto-representation. The humanists presented themselves as "new men," therefore they devote themselves, often in a more polemic than informed manner, to the critique of medieval philosophy. In fact, competition, imitation, and mutual exchange between courtly employed humanists, and the university professors trained in medieval rhetoric remain constant thought the entire Renaissance.

Innovative and Original Aspects

The rise of rhetoric in the Renaissance followed the growing circulation of ancient works: Quintilian's *Institutio oratoria* (discovered in 1416); Cicero's *De Oratore* (discovered in 1421) as well as many of his speeches, the Greek "New Sophistic," in particular Lucian of Samosate and Hermogenes of Tarsus. Aristotle's *Rhetoric* entered late into Latin Europe and took a great deal of time before being capable of rivaling the Ciceronian model: the most used text of medieval teaching was the *Rhetorica ad Herennium*, falsely attributed to Cicero until the end of the fifteenth century (Classen 2003).

Renaissance humanists considered rhetoric either as part of the argumentation theory or as part of the art of elocution, to persuade a specific public. The goal was to elaborate an effective discourse more than a plausible one. This is also the main reason for rhetoric's progressive impoverishment, reducing itself to an art of brilliant speaking in court societies. Rhetoric's evolution in the writings concerning *urbanitas* (urbanity) demonstrates this well. First, Ciceronian dialogues as well as the reflection on the relationship between laughter and rhetoric, presented by Cicero and Quintilian, furnish a model of civil conversation for the new urbanized and literate social classes. Beyond the spiritual and the economic life, rhetoric nourished the requirement of erudite and formally impeccable, although intimate, idle conversation, light where the remark, the repartee, the jets were considered to be the expression of one's own intelligence and of the recognition of certain social codes of decorum. In this perspective, Giovanni Pontano's *De sermone* (1509) praises *comitas* (affable courtesy), a smiling and ironic joviality, which must not offend others, but rather builds a link of complicity by the rituals of the new sociability. However, this was not intended as a form of faithful intimacy, since it is obtained by the rules of conversation.

The rhetorical art of civil and friendly conversations was progressively transformed into the art of the falsely spontaneous and highly artificial speech of the courtesan, who had no power over

the reality which surrounded him, but who nevertheless simulated a form of mastery of one's self and of events through light and ironic conversation. In Baldassare Castiglione's *Il Cortegiano* (1528) urbane conversation became the mask of courtesy, which conceals a reality of social violence. The courtesan did not take political decisions, and social rituals became his only playing field: nothing remained for him besides mimicking strength by verbal jokes deprived of any real efficacy.

Also, in the England of the Tudors, under Elizabeth I, the *elocutio* was the most important part of rhetoric because the charm holds the power over the will and the feeling, in order to persuade the public. In these respects, the most original treatise was Henry Peacham's *Garden of Eloquence* . . . (1577, revised in 1593). It is a detailed and normative dictionary of tropes and style figures that are considered as images of language that can arouse great emotions. However, following the conception of Erasmus's *Adagia* (1500), in which the Dutch humanist, an advocate of *brevitas*, held that the flowers of eloquence reflected the variety of the nature's garden (Jardine 1993), Peacham underlined in the second draft of his *Garden*, that the speaker must pay attention to the prudent use of the tropes, which must aim at the exact expression of thought and not be considered a simple decoration. So, rhetoric must teach the practice of tropes and the figures of style whose function is to make the speech effective, exciting, convincing (Mack 2002).

Yet, humanist rhetoric developed beyond the function of elocution to ensure adequate expression and the clear communication of thought. In this respect, rhetoric is linked to philology, as the art of correct restitution and the interpretation of ancient works. The diffusion of ancient texts led grammarians to work on fragmentary and sometimes corrupted textual traditions. To reestablish the authentic signification of a text from the past, it is necessary to know the context of production, its precise semantic, and the history of the language in which it was written. The attention for the eloquence of ancient works did not solely depend on an aesthetic preoccupation, but also

on the awareness of a precise lexicon in each historical linguistic context.

The understanding of an author's style therefore depended on the interpreter's rhetorical skills. With this in mind, Lorenzo Valla (1407–1457) wrote the *Elegantiae linguae latinae* (1435–1444), where he attempted to restore elegance, namely, the semantic specificity of the Latin language, in its historical evolution. The examination of the lexical pertinence of elocution and its history is an important element for the philological method, as Valla shows in his denouncement of the fake *Donation of Constantine* (*De falso credita et emenita Constantini Donatione* 1440) and in his annotations on the *New Testament* (*Collatio Novi Testamenti*, 1449). Erasmus of Rotterdam developed further on the editing and interpretation of the *New Testament* as well as of numerous Church Fathers, linking together the competences of the historian philologist, and orator. In the *De duplici copia verborum ac rerum* (1512), Erasmus underlines the link between the variety of expression and the richness of things, the first help to closely grasp the composite nature of the others.

The rhetorical interrogation about elocution equally touches philosophical terminology. For Lorenzo Valla, in his *Repastinatio dialectice et philosophie* (1439), literally the “re-tilling” of the dialectic and philosophy, the philosophers of medieval universities used an obscure jargon-filled language that separates them from an adequate understanding of the real: their style was rough and convoluted. The dispute between the philologist Ermolao Barbaro and the philosopher Giovanni Pico della Mirandola about philosophical writing demonstrates how controversial was the appreciation of elocution: Pico, in his letter to Barbaro, *De generi dicendi philosophorum* (1485), reacts to his friend's criticism according to which Pico's writing owes much to rhetoric, even though Pico claims to write as a philosopher and not as an orator. Pico understood Barbaro's ironic jokes. Therefore, he defended the philosophical writing of his favorite medieval authors, Thomas Aquinas and Duns Scotus: a sober writing centered on the precision of reasoning, devoid of flowery

rhetoric. Nevertheless, Pico recognized that even the most austere philosopher must follow the correct rules of Latinity if he wanted to express himself clearly and to make himself understood.

But the centrality of elocution is also underlined in reflections about the relationship between the poet and the orator, which was largely legitimized by Cicero, developed afterwards by the medieval poetics of *trobar clus*, poetry by enigma, whose ideal was taken from in part by Guido Cavalcanti, Dante, Petrarca, and Boccaccio. However, it was a matter of the initiated few, who needed to recognize the literary model, the innovation in imitation and the signification of allegories. The veil of poetry hides and equally unveils the secrets of nature, which the Platonists of Chartres read as being traces of divinity on Earth. Moreover, the humanist, poet and the orator fused together in the new figure of the grammarian/philologist who analyzed the literary processes of the ancient works with his rhetorical tools. In this respect, Pietro Bembo, in his *Prose della volgar lingua* (1525), considered that the literary models in the vernacular must be Petrarch and Boccaccio. However, he seemed to forget that these authors had been writers in both Latin and vernacular, privileging former. Lastly, the priority bestowed on elocution led to the loss of the argumentative nature of rhetoric itself, so that the questions of style became paramount as in Sperone Speroni's *Dialogo della retorica* (1542): here the preoccupation about figures of style prevails over proof, the epideictic genre over the judiciary and deliberative genre, the desire to delight over educative ambition.

Topical argumentation was equally taken back from theology. Of course, sacred rhetoric had been an important element of medieval culture. But humanism changed its signification. During the Middle Ages, the principle requirement had been legitimizing a persuasive but "humble" speech, capable of touching all publics, by imitating the persuasive speech of Christ. The Christian message had to be simple, accessible to everyone. Consequently, Christian rhetoric underlined the educative and persuasive function of the fable,

the allegory, the metaphor, of which the Bible gives numerous examples.

However, the fear of heresies led to wondering more about the psychological attitudes of the public that is brought to believe this or that thing. The *artes praedicandi* (the arts of predication) developed, between the twelfth and fifteenth centuries, the art of persuasion, even of conversion, in studying public attitudes. Gregory the Great, in his *Regula pastoralis* (in the sixth century) designated 36 couples of opposed characters (woman-man; young-old; poor-rich; wise man-fool, patient-impatient, humble-superb, etc.) but certain manuals of predication arrive at defining 120 categories of audience. In this context, rhetoric was considered essentially the art of *mouere*, which arouses and the passions and takes assent that way, in influencing character.

But rhetoric during the Renaissance was developed as an important part of plausible argumentation and its proofs. Against the technical language of the dialectic in medieval universities, rhetoric seemed to be to an appropriate model of argumentation for the real life. Yet, rhetoric cannot deduce necessary conclusions but rather only plausible ones: it aims at persuading by arguments, but also through the capacity of influencing the audience's passions and through the orator's moral posture. However, Humanists went beyond taking back these elements from the medieval rhetorical tradition, but rather they carried out significant transformations in a narrow confrontation with the dialectic and the multiple attempts to decompose and to recompose their respective functions. After all, during the Middle Ages Cicero himself was considered to be a *magister* of the dialectic.

In this context, the first humanist rhetorical treatise in Italy was *Rhetoricorum libri V* (1433–1444) by the Byzantine George of Trebizond, who draws elements from the *Rhetorica ad Herennium*, from the Second Sophistic, above all from Hermogenes, and also from Martianus Capella (Monfasani 1976). His principal author however remained Cicero, from

whom he appreciates, on the one side, the speeches, such as the *Oratio pro Roscio*, the *Oratio pro Ligario*, *Pro Lege Manilia*; on the other hand, the theoretical texts on rhetoric, such as the *Partitiones oratoriae*; *De inventione*. From the theoretical point of view, George of Trebizond's reflection implies two principal aspects: the assertion of the link between the political life and rhetoric as well as the separation between rhetoric and philosophy. Thus, rhetoric is, for George of Trebizond, a civil science concerning any political and social problem. The goal of rhetoric is therefore to convince an audience on a political question. The exercise of judgment and of deliberation has priority, therefore the epideictic genre, which decides on what is honest and what is agreeable, is situated outside of the field of true judgment. The political nature of rhetoric led George of Trebizond to develop elocution, in to the rhetorical tradition, and to historians such as Sallust and Livy.

The disposition of speech emphasizes strategies of persuasion. George of Trebizond took over the ancient doctrine of *ductus* ("expression, organization, and outline") that is found in Martianus Capella, and in part in Quintilian and Hermogenes. This doctrine classified discourses according to the relationships between what the orator expressly says and what he means to signify. If he says what he thinks, then he uses *ductus simplex*, if he says what he thinks, but by others reasons than those which are exposed, then he uses *ductus subtilis*; if he says what he does not think, in order to obtain public consent more easily, he uses *ductus oblicus*. Such a classification clearly denotes the activity of negotiation of ambassadors and of politicians, who must not hesitate using misleading and warped arguments to be convincing.

Discourse must therefore be effective. Thus, George of Trebizond detaches rhetoric from all moral considerations. The orator must not be, against Cicero and Quintilian's conviction, a good man. In the same way, the orator is equally detached from philosophy. Philosophy is speculative, since it deals with universal questions, concerning the ontological structure of things

and their immutable truth, while rhetoric, as a civil art, must judge contingent situations, in order to make shrewd decisions. However, effective speeches must be credible and call for a logical training, so that they must follow rules in order to find the best compelling arguments.

One of the most important elements that George of Trebizond introduces, taking it from Cicero and Hermogenes, is the theory of the *status quaestionis* or *causae* (the state of investigation), which had been generally neglected during the Middle Ages. The *status* designate the position on which two adversaries agree to start confronting each other on a controversial subject. For Cicero, there are three *status quaestionis*, or points of view according to which a question must be treated: conjecture, which wonders if a thing is; definition, which wonders about the nature of a thing, and quality, which wonders about the specificity of the thing. For example, the accusation affirms: "X killed." Whereas the? replies: "no, X did not kill," from which arises the point of view that the controversy must be organized from, namely: "did X kill?" (which expresses a conjecture, wondering if the fact took place. We could wonder after if it is a matter of homicide (definition) or if it was an act of self-defense (quality). The *status* therefore allow delimiting precisely the controversy and finding the most pertinent arguments. George of Trebizond, however, does not limit himself to taking up the Ciceronian three-way divide, but it enlarges it by borrowing Hermogenes' list, which establishes thirteen positions, among which are antinomy, amphibology, and counteraccusation.

Lorenzo Valla in his *Repastinatio dialectice et philosophie*, propose a different project. The reform of the art of argumentation must serve to resolve controversial questions in *negotia*, but its links with morality and philosophy are essential. Valla estimates that rhetoric teaches using an elocution which is appropriate to the treated subject because it is expressed in a precise, but ordinary, language, following the criteria of *elegantia* "elegance," namely of the lexical pertinence of a given

historical language. So, *consuetudo*, common sense, roots a community in its institutions, above all in its language and allows communicating with one another, in reciprocally understanding each other. If rhetoric ensures the communication of thoughts in discourse, dialectic deals with putting to the test the validity of remarks by taking back up the two principal functions of the Aristotelian dialectic: interrogation and refutation (Mack 1993).

However, the link between rhetoric and dialectic is carried out by the reprise, for Valla, of the topical argumentation. The *topoi/loci* or “commonplaces” are the schemata of intelligibility, which allow elaborating better arguments to justify a thesis that one would want to make accepted by others (Biard and Mariani 2009). The commonplaces tell us where to go looking for such arguments, for example, in the commonplaces of oppositions, likenesses, causes/effects, or of less and more (which would allow for example constructing an argument such as: “If even the knowledgeable do not know everything, then I have the right to not study”). Yet, in the Aristotelian tradition, dialectic as well as rhetoric use commonplaces, but they are not, most of the time, the same and do not follow the same division. However, Cicero, in his rewriting of Aristotle’s *Topics*, had presented an exhaustive list and a definition of commonplaces specific to juridical argumentation, which became the model of any rhetorical argumentation. The commonplaces therefore allow proposing better arguments for a thesis, and this is why they intervene in the genesis of arguments, called “invention.” But *inventio* is not a matter of finding arguments of a hypothesis by chance, but by recognizing indexed modalities that can be used in an inventive manner, appropriate to a contingent situation.

Lorenzo Valla drew upon the list of commonplaces that Quintilian had enlarged from Cicero. The advantage of argumentation from commonplaces is that it introduces the mediation of maxims (and not only of premises) that allows constructing plausible arguments from a deontic point of view. This signifies that the modalities of

validity are not the necessary, the possible, etc., but what is useful, what is credible, what is agreeable, because they are more appropriate to describe the requirements of everyday life. Moreover, the devices of argumentation are enlarged: Valla introduces induction as a comparison between resembling elements, deductions with a single premise, analogies, polysyllogisms, in short, ampliative inferences, the conclusions of which contain more information than the premises (which breaks one of Aristotle’s “golden rules”). Consequently, argumentation extends knowledge by new information, even though only credible and plausible.

Rudolf Agricola developed this approach in his *De Inventione dialectica* (1515). His work clearly shows how the new link established between dialectic and rhetoric gives rise to an original form of argumentation. For Agricola, dialectical invention is the art of arts since it can treat any controversial subject. It does not depend on any particular science and allows arguing in the most feasible and plausible manner on any subject. Agricola formalizes dialectical invention in a strict manner: it depends on commonplaces. The topic is not only the art of discussion, but the whole of logic. In this way, the topic changes nature. For Agricola, in effect, the “commonplaces” are the points of view that show all the aspects of this or that subject. They are therefore not only forms of predication, but also heuristic modalities, uncovering the primary and secondary qualities of all objects. Description takes on a crucial importance at the expense of definition: knowledge must consider not only the primary qualities (uncovered thanks to the “commonplaces” of genus, species, whole and parts, etc.) but also accidental or secondary qualities (uncovered thanks to the “commonplaces” of resemblance, consequences, etc.). Even more than for Valla, for Agricola inferences must be ampliative: they allow increasing knowledge of controversial things; so the analysis of resemblances and of differences is essential. Agricola underlines, for that matter, the importance of the most contingent commonplaces (borrowed from Quintilian), such as the commonplaces of the person, time, and space.

The argumentative function of the commonplaces was similarly determined by Pierre de La Ramée, (1569) a Huguenot philosopher, killed immediately after Saint Bartholomew's Day massacre (1572). In his *in tres primas liberales artes* de La Ramée considers that the laws of logic correspond to the laws of the intellect, of which the commonplaces express the divisions. In this respect, the commonplaces contain the categories. Invention and disposition are, as for Agricola, the two essential parts of topical argumentation. However, de La Ramée distinguishes the functions of dialectic and rhetoric: the former deals with style, and the latter deals with invention, true argumentation, and disposition. De La Ramée's key concern is however the method of argumentation which must proceed from more general and truer arguments to what is more particular, in knowing everything that is necessary (primary and secondary qualities) about a subject. The practice of diagrams serves this finality and contributes to rendering topical arguments spatial.

On the other hand, the introduction of the topic in the humanist theological field stresses the argumentative and nonpsychological nature of rhetorical effectiveness, all the while wanting to respond to the same requirements of communication and education. Philip Melancthon, the friend of Martin Luther, in his *Loci communes rerum theologicarum, seu, Hypotyposes theologicae* (1521) recognizes the synthetic and educative power in theology, such as in the notions of sin, law, and grace. Consequently, Melancthon replaced rhetorical/dialectical commonplaces by commonplaces drawn from the reading of Saint Paul, such as God, the One, the Trinity, man, sin, faith, hope, sacraments, etc. Manifestly, not only do commonplaces here have a new theological signification, but also a structural function. They no longer serve to establish a plausible conclusion but legitimize indisputable dogmatic truths. Consequently, they lose their schematic function and are rendered spatial in *capita* ("chapters") that summarize doctrinal teachings. In this respect, the Dominican theologian Melchor Cano, in his *De locis theologicis* (1563), recognizes the benefits of the

Protestant usage of the topic and wanted to propose a Catholic equivalent in time for the Council of Trent. However, the argumentative nature of the commonplaces is more developed than the educative function of Melancthon's commonplaces. For Cano, in effect, the commonplaces do not serve to summarize given truths, but to find the best arguments in order to refute or support a thesis. Cano's commonplaces replace, however, the human commonplaces by other ones: the Holy Scripture, oral transmission, the Church, the decisions of the Councils, the authority of the Church Fathers, the authors of scholasticism, above all Thomas Aquinas, natural reason, philosophy, and history. The tendency to render the commonplaces spatial is therefore equally found in Cano. The commonplaces make up in fact the "treasure" of sources of authority where one can find justification for his remarks.

Ultimately, the tendency of rhetoric and dialectic to render the commonplaces spatial progressively removed its discursive nature from argumentation and weakened the relationship between proof and credibility. The commonplaces become the common places in which a culture uncovers, as within a treasure, its most precious goods (religious convictions, rules of behavior, diverse sources of authority, prejudices).

Impact and Legacy

Yet, the influence of the topic, as an art of novel argumentation, at the crossroads of dialectic and rhetoric, comes together in Francis Bacon's *Novum Organum* (1620). The attempt to reform Aristotelian logic, in proposing a new inductive method, is rooted in the humanist tradition. For Bacon, induction is not the analysis of the accumulation of cases, but rather the result of a topical procedure that uses a system of *tabulae* (registers) (absence, presence, likenesses, differences) that take up and transform topical schemata. In particular, Francis Bacon underlines the importance of the analysis of secondary qualities in order to correctly describe a phenomenon and increase knowledge.

Ribadeneyra, Pedro

Born: 1 November 1526

Died: 22 September 1611

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

Pedro de Ribadeneyra, S.J., was one of the earliest members of the newly founded Society of Jesus. Born in 1526 in Toledo, Ribadeneyra spent most of his youth without a father. When he was introduced to Ignatius of Loyola at the age of 13, Ribadeneyra found in the Spanish saint a kind of spiritual father. In 1540 Ribadeneyra joined the Society of Jesus and made a career teaching rhetoric and composing biographies of some of the earliest members of the Society of Jesus. One of his most famous biographical pieces is the *Flos Sanctorum*, which details the lives of many saints within the sanctoral cycle of the Church's liturgical seasons. In addition to being a hagiographer, Ribadeneyra also touched upon matters of political philosophy. His *Tratado de la religion y virtudes* argued against Machiavelli-inspired politics in support of a monarchy that rules according to true Christian virtues. Ribadeneyra died in 1611.

Biography

Pedro de Ribadeneyra, S.J. (Born 1 November 1526, Toledo–Died 22 September 1611, Toledo), was among the first members of the newly

founded Society of Jesus. He was born of a rather noble family in Toledo, but lost his father at a young age (Bilinkoff 1999, 180). Lacking a father, Ribadeneyra would eventually come to fill the void and experience the tumultuous dynamics involved in the father-son relationship with his spiritual father, Ignatius of Loyola. His education as a youth was mostly humanistic and transpired first in Toledo and then in Louvain and Padua (Schmutz 2014). When he was only 13 years old, Ribadeneyra's mother arranged for him to be a page of the Italian Cardinal Alessandro Farnese, which meant the boy's move to Rome in 1539. It was in Rome – and not long after his move there – that Ribadeneyra made the acquaintance of Ignatius of Loyola, the founder of the Society of Jesus. At this point, Ignatius was in the process of obtaining papal sanction for his new religious order, and, only 8 days before he received official approval, Ignatius inducted Ribadeneyra into the fledgling society on 18 September 1540 (Bilinkoff 1999, 181; Schmutz 2014). Made a Jesuit at the age of 13, Ribadeneyra would – with all the ups and downs, some more dramatic than others, that constitute life – remain a Jesuit for around 71 years until his death in 1611.

Ribadeneyra began his studies in Paris before moving to Louvain and eventually to Padua. His early formation proved to be fraught with various challenges. As Ribadeneyra was still a child when he joined the Society of Jesus, one is hardly surprised to learn that he experienced the same turmoil and growing pains that accompany anyone's passage into maturity. Growing up can be a difficult matter for anyone but the task rendered twice as difficult, if not more so, when one grows up in the regimented confines of a religious order. Ribadeneyra himself tells us that he was “restless, naughty and impetuous, free-spirited and spoiled” (Bilinkoff 1999, 190). His Jesuit brethren's opinion was no better, as he was regarded as a terror and “little devil” (ibid.). Evidently, the vexing demons of youth reached a critical point when he was 17. Studying in Louvain, Ribadeneyra was summoned back to Rome in

1543. Answering the summons, Ribadeneyra headed back to the eternal city but succumbed to exhaustion when crossing the Alps; his was an exhaustion that was fueled as much by mounting anxieties concerning his vocation as by the arduous journey itself (ibid.). Ignatius of Loyola himself intervened and, after leading the young Jesuit through the spiritual exercises, helped Ribadeneyra resolve his concerns regarding his vocation. From thence, according to Ribadeneyra, he had no reservations or doubts about his vocation again (ibid., 191).

Ribadeneyra continued with his formation and studies. In 1549 he traveled to Palermo to help establish a program in rhetoric and Latin at the new Jesuit College there. Three years later, he was called to Rome to help establish yet another Jesuit educational venture, namely the Roman College, where he taught rhetoric (Schmutz 2014). In 1555 Ribadeneyra was sent to Belgium and then in 1558 to England (ibid.). Between 1555 and 1574, Ribadeneyra held various posts within the Society of Jesus in various locations, for example, Rome, Paris, Brussels, and London. Finally, with his health weakening because of the fatigue of constant travel, in 1574 Ribadeneyra returned to Spain and began the work for which he is most famous, namely, hagiography (ibid.).

One of his most famous works is the *Flos Sanctorum*, a compendium of several saints' lives published in Madrid in 1599 (Bilinkoff 1999, 181). Though God is made known throughout all His creation, explains Ribadeneyra, His omnipotence, wisdom, providence, and goodness are especially known in the virtues and souls of the saints (prologue). The *Flos Sanctorum*, then, is organized into various saints' feast days and arranged by month through October. It begins with a discussion of the pedagogical character of Christ's life, passion, and death, and the importance of emulating him. Ribadeneyra details the various events of Christ's life found within scripture and in the early Church Fathers. After his lengthy introduction concerning the life of Christ, Ribadeneyra then turns to a discussion of the liturgical feasts

celebrating the life of Christ as well as the Godhead, namely, the Resurrection of the Lord (fols. 23–28), the ascension of the Lord (fols. 28–32), the descent of the Holy Spirit (fols. 32–39), the feast of the Most Holy Trinity (fols. 39–45), and, finally, the Feast of the Most Holy Sacrament (fols. 45–56). The life of Mary, the mother of God, then occupies the next several folios of Ribadeneyra's work.

The *Flos Sanctorum* together with a number of other biographical writings established Ribadeneyra as a biographer *par excellence*. His service is especially valuable concerning the histories of the earliest members of the Society of Jesus, many of whom he knew firsthand, having experienced the inception of the new religious order. Ribadeneyra's biography of Ignatius of Loyola, the *Vida de San Ignacio de Loyola*, is an especially important work since it provides not only an encomium of the saint's life but it also documents the founding of the order (Bilinkoff 1999, 182). Accordingly, with his attention to documentary evidence, his almost exclusive use of literary third person and his shying away from discussions of miracles brought about by the saint, Ribadeneyra's work is notably "modern" in character (ibid., 182–83).

Ribadeneyra's *Flos Sanctorum* and *Vida* are also accompanied by yet another biography, the *Vida de Estefanía Manrique de Castilla* (the story of a devout noblewoman) and his *Confessiones*, an autobiography of the Jesuit himself. Beyond his biographies, Ribadeneyra is also known for his history of the English schism, the *Historia del Cisma de Inglaterra* (1588). This work would cause difficulties between Ribadeneyra and his superiors, who had forbidden him to publish the volume. Though the volume clearly articulated the Catholic position in its opposition to the Church of England in its break from Rome, Ribadeneyra's superiors were concerned that the chronicle of heretical events would actually promote heretical ideas themselves. When he appealed the decision before an advisory committee, the decision to forbid publication of the work was reaffirmed. Accordingly, Ribadeneyra

appealed to Claudio Acquaviva, the general superior, who finally gave permission for the text to go to print (ibid., 192).

Finally, mention must be made of Ribadeneyra's political work, the *Tratado de la religion y virtudes* which appeared in Madrid in 1595. As the very (sub-)title of the text itself suggests (*contra lo que Nicolás Machiavelo... de este tiempo enseñan*), Ribadeneyra offered it in direct opposition to Machiavellian values that were in circulation following the aftermath of Machiavelli's *The Prince* (1513). In this work, Ribadeneyra attempts to make clear the principles which must govern the Christian ruler. In fact, the Jesuit goes so far as to claim that it is impossible for any ruler to maintain his kingdom or state without fostering religion, which is at once as natural as it is obligatory (c. 1; fol. 1). Even Machiavelli acknowledges the role of religion in conserving the state, Ribadeneyra notes, but the difference between the Jesuit and Machiavellian politicians is that the latter utilize the religion of their subjects, "whether true or false" in preserving the state, whereas Ribadeneyra insists upon Catholicism as the only true religion. Thus the politicians only have the "appearance" of serving the religious needs of their subjects, but Ribadeneyra maintains that the true ruler should serve according to the truth of the Catholic faith (ibid.; fol. 4). In short, Ribadeneyra regards political rule as a vocation, such that the ruler is ultimately accountable to God.

Abstract

Antonio Riccoboni, who taught rhetoric at the University of Padua, was a humanist, historiographer (*Commentarius de historia liber*, 1568; *De gymnasio patavino*, 1598), and the author of translations and commentaries concerning Aristotle's *Ethics*, *Rhetoric* and *Poetics*; as regards this latter work in particular, he offered an original interpretation focusing on the importance of the *fabula*. He was also involved in philological debates (on the attribution of a *Consolatio* to Cicero and on the interpretation of Horace's *Ars Poetica*), wherein he was notable for his philological training and astute critical judgement.

Biography

Antonio Riccoboni, having studied initially at Rovigo, moved on to Venice and then to Padua, where he was a pupil of Paolo Manuzio, Marcantonio Mureto, and Carlo Sigonio; he was a member of the *Accademia degli Addormentati* (abolished in 1562) and of the *Accademia degli Animosi*, founded by the abbot, Ascanio Martinengo, whose members included, among others, Sperone Speroni, Bernardino Tomitano,

and Francesco Piccolomini. In February 1571, he obtained a doctorate in civil law from Padua University, followed by another one in canon law and, in the same year, he became a professor, a position he held until his death. He also worked with distinction as a public orator, evidence of which is found in two books containing 34 of his orations, published in Padua in 1591 and 1592; these include the three speeches Riccoboni made on the occasion of his academic induction and which focus on the liberal arts, *studia humanitatis* and rhetoric. In 1581, he was granted honorary citizenship of Padua and in 1583 the University employed him to draw up its Statutes. Only a small number of his letters remains, notable among which is a letter to Galileo Galilei (11th March of 1588).

Heritage and Rupture with the Tradition: Innovative and Original Aspects – Impact and Legacy

Riccoboni was noted for his deep interest in historiography. In 1568, he wrote *De historia commentarius*, in which he examined the purpose of history and its relationship with grammar, rhetoric, and poetics, while also devoting attention to the study of sources (the work also contains a selection, with commentary, of fragments from Latin historians). In 1570, he was appointed to revise – together with Andrea Nicolio – the statutes of Rovigo, a job that took 20 years to come to fruition. But in this area, the work that brought him most renown (and which was also his last) is *De Gymnasio Patavino* (1598), the first study of the history of Padua University, the structure of which – focusing on affairs relating to the *doctores clariores* – influenced most of the work of his successors.

Riccoboni should, however, be especially remembered for the intensity of his work on interpreting the writings of Aristotle, concerning which he produced translations as well as commentaries: in particular, he translated the first

book of *Nicomachean Ethics* (1577) and also the first book of *Rhetoric* (in the same year), the first complete translation of which he published in 1579, accompanied by a rich commentary and, as an appendix, by the translation of Aristotle's *Poetics*, regarding which he also, in 1584, published a notable commentary; his commentary on the whole *Ethics* appeared in 1596 (Lines 2002, 517). Despite its debt to Lodovico Castelvetro's interpretation, the main novelty of this work lies in its original redefinition of the role of poetry, identified in the *fabula* as able to generate pleasure and, therefore, useful (Toffanin 1920, 136 ff.). Thereby Riccoboni released poetry from a position dependent on utilitarian interpretation, without however leading it towards pure hedonism.

He was also involved in two significant controversies, which throw light both on his philological acuity and on his capacity for independent judgment. The first, involving Carlo Sigonio, revolved around the attribution of a *Consolatio* to Cicero, advocated by Sigonio in an edition devoid of editor's notes or comments, published in 1583 (modern scholarship endorses Riccoboni's rejection of Cicero's authorship, believing the work to be a forgery by Sigonio – see McCuaig 1989: 307–326; Forsyth et al. 1999, 1–26). The second controversy involves the Bergamasque priest Nicolò Cologno, who in 1587 had published a pamphlet, *Q. Horatii Flacci methodus de arte poetica*. Cologno had affirmed that Horace's *Ars poetica* had a coherent internal structure, which in his opinion reflected the Aristotelian genre system (epic, tragedy, comedy, and the satyr play). Riccoboni took a contrary stance in his *dissensio de epistola Horatii ad Pisonem* (1591). Unlike the earlier case, in this debate the reasons for scientific dissent here seem to be entangled with personal ambition: in 1591 Cologno won a professorship of moral philosophy at the Padua *Studium*, previously held by Giason Denores, to which Riccoboni also aspired (Frischer 1996).

School of History, University of St Andrews,
Fife, UK

Abstract

Martin del Rio was a Spanish-Flemish Jesuit (1551–1608) who was renowned in his own day as one of the most learned men in Europe. He published several volumes of edited and annotated Roman authors, but his lasting fame rests upon a massive survey of magic, witchcraft, and allied subject matter which he published in three volumes in 1599–1600. It is remarkable for the extent of its inquiries and discussions, and the erudition supporting them,

and it became the fundamental textbook for theologians and lawyers in particular until the middle of the eighteenth century. Its influence on witchcraft prosecutions was thus immense.

Biography

Between c.1560 and 1660 Europe underwent a terror that evil aspects of the spirit world had been or were about to be unleashed and that large numbers of human agents were in league with Satan to subvert and destroy people's daily life on earth and prospects of ultimate salvation. These agents were almost any workers of magic, witches especially, who voluntarily made a pact with the Devil to obtain powers during this life in return for their soul hereafter. To help protect society against this terror, and to thwart Satan's malignant designs, secular states, sometimes supported by the various Churches, set about removing Satan's human agents via criminal prosecution and subsequent execution of those found guilty. These widespread and genuinely felt fears were systematized and given intellectual coherence by a series of writers, both Catholic and Protestant, throughout the most intense period of prosecution, building upon a tradition of essays and treatises from the 1480s to 1490s when earlier rumblings had foreshadowed the century of prosecution to come. The most detailed and influential of these earlier works had been the *Malleus Maleficarum* (The Hammer of Women Who Practice Harmful Magic) by a German Dominican, Heinrich Kramer (also called "Institoris"). *Malleus*, divided into three Books, addressed three audiences, the first theologians, the second preachers, and the third secular and ecclesiastical judges. It thus covered a very broad ground and gave pertinent advice to those groups and professions most intimately concerned with the problem of magic and the solution to its perceived threat to society.

After Kramer, the most significant writer in this field was Martin del Rio, a Jesuit, born in Antwerp on May 17, 1551. He came of a noble Spanish family. His father Antonio was Castilian, his mother Eleonora Lopez, Aragonese, and via his mother Del Rio was related to the French essayist Montaigne who later expressed trenchant skepticism with regard to the validity of witchcraft. Antonio was in royal service in the Spanish Netherlands and destined his eldest son for a political career right from the start. Hence, Martin was afforded every opportunity to get a good education and early in life showed a gift for languages, acquiring Greek, Latin, Hebrew, and a working knowledge of Aramaic, along with fluency in Spanish (his native tongue), Flemish (since the family was living in that part of the Spanish Netherlands during his childhood), German, Italian, and French. Many of these he seems to have studied in Lierre, a town about 9 miles southeast of Antwerp, before moving to Paris in the mid-1560s where the appearance of a series of editions of Latin authors, published by Denis Lambin at this same period, may have encouraged him to embark on his own annotations of Solinus and Claudian which he published a few years later in 1572. But he cannot have stayed long in Paris because from there he moved to Douai where he heard lectures on jurisprudence, after which he went on to the University of Leuven where he studied mathematics under Johann Stadius (of whose trust in electional astrology he disapproved) and jurisprudence under Pieter Peek the Elder, receiving his bachelor's degree in civil law in 1570. After this he took to his travels again, for at some point during the academic year 1571–1572, he was back at the College de Clermont to hear a series of lectures on demons by the Jesuit, Juan de Maldonado.

Throughout these years, France in general, and Paris in particular, was in a ferment of religious hostility between Catholics and Protestants, a turmoil which culminated in a massacre of Protestants in Paris and elsewhere in August 1572. Maldonado himself took part in a missionary drive in Poitou for several months between winter 1569 and September 1570, where he witnessed a large success in eradicating heresy and so returned

to the capital filled with the combative enthusiasm which informed his 1571–1572 lectures. In these he described the link he saw between heresy, demons, and witchcraft with a fervor which inspired not only Del Rio but several other writers on the same subject matter. Heresy spawned witchcraft, he said, both being aspects of a single ghastly crime, and it was people's blind unwillingness to see and confront these spiritual dangers which opened the door to Satan. Magic of all kinds, superstitious actions, witches, witches' meetings known as "Sabbats," the murder of infants for their fat, contracts with demons, and a witch's flight through the air, all these, denied by heretics, were real and thus offered an urgent challenge to faithful Christians. Satan encouraged these divagations from the faith, participated in them, and profited by them. Hence, their eradication would diminish his worldly influence and combat effectively his assaults on human souls. Del Rio absorbed, remembered, and reproduced these sentiments and theories when, nearly 30 years later, he came to write his own substantial treatise on the subject. So too did Pierre de Lancre in treatises published 1612, 1622, and 1627, the fruit not only of his own experience as a judge in witchcraft trials in 1608–1609 but also of the same formative educational experiences as Del Rio at the College de Clermont under Maldonado's tutelage.

By 1573 Del Rio was in Spain, studying for his doctorate at the University of Salamanca, Maldonado's alma mater, two of whose most noteworthy alumni were St Ignatius Loyola and St John of the Cross. There Del Rio continued to pursue civil law and in 1574 was awarded his degree for a thesis on commercial transactions, an appendix to which included notes and commentaries on aspects of Greek and Roman law. Returning thereafter to his home province of Brabant, he was made a member of the province's supreme court by King Philip II and, while there, produced a weighty and highly regarded tome on civil law. This was a period of turbulence in the region as King Philip's half brother, John of Austria, met resistance as he tried to assert Spanish control. Del Rio's family, prominent as it was, did not escape violence, his uncle Luis being arrested

during a full session of the senate in Brussels in 1576 and his father in 1577. Nor did Del Rio himself remain untouched, for he lost his extensive library to fire when rebel soldiers pillaged his father's house. John of Austria, the family's patron, died in 1578 and Del Rio commemorated his efforts to restore order in a book on the rebellion which he published under the pseudonym Rolando Natin Miriteo, an anagram of his own name.

Deeply affected by events during these latter years, Del Rio went back to Spain where, after a period of depression, he recovered his spirits and turned to religion in what may seem to have been an unexpected conversion but which was actually a change of direction fuelled by a lifetime's devout adherence to the faith, now sharpened by his experiences in the Spanish Netherlands which had lit in him an ardor to combat heresy. There were parallels with St Ignatius of Loyola. Both men were nobly born; both had tasted war and suffered because of it; and both had a period of reflection which resulted in a commitment to the religious life, St Ignatius at the age of 30 and Del Rio at 29. It is therefore not altogether surprising that in 1580, Del Rio decided to enter the Society of Jesus, beginning his novitiate in Valladolid on May 9 that year. After an initial 3 years there, he was sent back to the Spanish Netherlands by his superiors. His health, however, broke down on the way, and it was while he was staying in the Jesuit house in Bordeaux that he learned his father had died in Lisbon. From Bordeaux he went to Calais where he saw roses blooming in winter, a sign, it was said, of plague to come, and from Calais he passed to Leuven and Mainz where he continued his theological studies.

By 1589 he was back in Douai, teaching philosophy, although he did not stay there long, for in 1591 he found himself removed to Liege where he taught moral philosophy. Between 1595 and 1597 he seems to have commuted between Leuven and Spain, a series of journeys which could not have been easy and on one occasion at least in 1597 nearly cost him his life when his ship was caught in a severe storm off Cap Gris Nez. It was during 1597 in Leuven that he gave a series of lectures on superstition and the evil arts, clearly the result of

his accumulating information on the subject either while preparing to write *Disquisitiones Magicae* or actively engaged on them. From 1597 to 1600 he was in Graz, teaching at the new university which had opened in 1586, but by 1600 his health needed the warmer climate of Spain and so he returned to Salamanca. (It is noteworthy that on the title page of *Disquisitiones*, he describes himself as "formerly of the University of Graz, now Public Professor of Holy Scripture at the University of Salamanca.") A final journey in 1608, however, undermined him completely. On August 18 he left Pintia in the province of Valladolid but was unable to reach Brussels until October 18, and even then his difficulties were not over, for he was told to make his way to Leuven at once. The two cities are only about 16 miles apart and so Del Rio was able to arrive that same evening. But his constitution had been so weakened by fatigue and illness that the next day he needed to see a doctor. The physician gave him up for lost, so Del Rio made his confession, received the sacrament, and died quietly at "the seventh hour," about 1 o'clock in the afternoon.

The 1590s and 1600s saw Del Rio at his most productive. Publications from this time include a collection of sermons under the title *Marian Blossoms* (1597); the work for which he is most famous, *Disquisitiones Magicae* (Investigations Into Magic) (1599–1600); commentaries on the poems of St Aldhelm (1601) and the Biblical Song of Songs (1604); *A Work about Mary* (1607); a defense of Dionysius the Areopagite against Scaliger's criticism (1607); a commentary on Genesis (1608) and on Lamentations (1608); and *A Lighthouse of Holy Wisdom* (1608). A review of these makes it clear that *Disquisitiones* stands out from the rest since it is neither a work of religious devotion nor an essay in literary and textual criticism, although it actually partakes of both via its ultimate intention and Del Rio's working methods. The question therefore arises, why did Del Rio write it? If we accept what Del Rio's commemorative biographer, fellow Jesuit Heribert Rosweyde, says, Del Rio was writing and revising it while he was in Leuven between 1595 and 1598. This is just when the Counter-Reformation, with Jesuits at its

spearhead, was consolidating its attack on the Calvinism which had spread rapidly throughout the region since 1566. Del Rio's superiors had clearly seen him as part of the counter to religious upheaval, and *Disquisitiones* should thus be seen, at least in part, as a polemical work intended to provide clarification of the links, indeed near-identity, between magical activities and the spread of heresy which gave rise to an aggressive warfare, stimulated and directed by Satan, which was being waged by witches and heretics alike against the Catholic Church. Fears that the period's religious wars were heralding the End of Days and final judgement served only to exacerbate people's anxiety and intensify their fears of Satan and his demonic and human agents. *Disquisitiones* is thus a call to arms, a warning, an explanation, and a remedy, all in one, set out in the clearest and most prolific detail, leaving no aspect of its subject matter undiscussed.

The scope of the work, then, is immense. It is divided into three volumes, each consisting of three "Books," and covers every aspect of magical belief and practice common in Western Europe at the time, as well as other subjects such as alchemy, astrology, and divination which bordered upon or overlapped that general corpus. Book 1 goes straight to the root of the problem as Del Rio sees it, namely, superstition in all its forms. This he sees as a perversion of religion which takes, deliberately or not, the form of idolatry, either overt or implicit. Anything other than direct, intentional worship of God runs the danger, at best, of unintentionally slipping into the worship of something or someone else. At worst it does so deliberately. Hence, with the spiritual dangers inherent in every superstitious practice and if one bears in mind the presence of Christian words, symbols, names, and prayers in much of the popular magic of the day, Del Rio's point becomes especially clear. He then proceeds to magic itself which he divides into three types: natural, artificial, and demonic. The first is derived from knowledge of the natural world and thus includes astrology and alchemy. Whether practice of natural magic is licit or illicit depends on whether it is used for natural or preternatural purposes, and

its principal danger lies in the ease with which it may tip into demonic magic, the latter depending, as its name suggests, on overt or tacit assistance from evil spirits. Artificial magic rests upon human ingenuity to produce wonderful effects and so ranges from conjuring tricks and illusions to the use of incantations, music, written characters, and so on with the intention of causing magical effects. It thus overlaps with natural magic and superstition.

Book 2 is devoted to the kind of magic which depends on the assistance and cooperation of evil spirits. At the root of this magic is a pact, explicitly or implicitly made between a human being and an evil spirit. In return for his or her soul, the human is granted the use of powers beyond those naturally possessed by humanity, and while magical practitioners cannot stray beyond the laws of nature with these powers, they can accomplish a great deal with the help of their demon – for demons can move at more than human speed and their superior knowledge of the inner workings and potentialities of nature enables them to do things which either appear to be astonishing or to be flat contrary to anything nature normally intends. Del Rio gives many examples, such as transvection of witches through the air, appearances of the dead deliberately invited, and bilocation, and discusses not only how far demonic powers can go but also to what extent their marvels are real or merely illusions introduced into humans' heads to deceive and entrap them. Other questions commonly asked at the time are also considered. Can witches have sexual intercourse with demons and so give birth to children? Can they really change shape? Do they have any genuine control over the demons they claim to command? Del Rio's conclusions vary. He accepts the reality of the flight to the Sabbath and of the Sabbath itself but has reservations about the other behaviors popularly attributed to witches and ends by asserting that evil spirits cannot be coerced by human beings, the exception to this being priests who perform exorcisms sanctioned by the Church.

Book 3 follows the lead of Book 2 and concentrates on harmful magic and superstitious practices. Del Rio defines what is meant by "harmful

magic" (*maleficium*) and then discusses the range of behaviors and experiences caused by this type. They include not only obvious acts of hostility such as causing illness, abusing and killing children, and inflicting impotence but also inflicting demonic possession and manipulating people's emotions via love magic, this last coming under attack not only for its interference with people's feelings but also for its frequent resort to the improper use of ecclesiastical objects such as holy water, candles, incense, priestly vestments, and, much more seriously, prayers and the Mass itself. God allows Satan to tempt individuals into these practices partly because the temptation creates opportunities for people to strengthen and increase their virtue and partly because yielding to these temptations leads to punishment for the underlying proclivity to sin which made someone vulnerable to temptation in the first place. How easy it can be to slip into these kinds of sin is illustrated by an extensive discussion of popular superstitious practices. Del Rio reviews the widespread use of charms and divinatory techniques and weighs their validity or invalidity, ending with an exhortation to his readers to eschew their use completely.

Book 4 picks up the theme of divination and prophecy, asking what is the difference between divination and prophecy and how one is to tell the difference between a genuine message from God and one relayed by the Devil. Del Rio says they have certain aspects in common, but that divination reveals hidden things from the past as well as from the future and does so as the result of a tacit or explicit pact between the human agent and an evil spirit. Divination thus depends entirely upon traffic with evil and is limited in its apparent accuracy, partly because a demon may deceive and partly because even a demon's knowledge is limited. Divinatory practices, of which Del Rio provides many examples, are shot through with blasphemy and idolatry and those used to test a person's guilt or innocence, such as swimming a witch, are to be avoided as both insufficient and blasphemous in as much as on the one hand they are unreliable and on the other they are forbidden by the Church because one does not tempt God by asking Him to perform a miracle in dubious

circumstances and for somewhat dubious purposes. This discussion of popular purgations brings Del Rio to Book 5 and the specific case of witchcraft and how it should be dealt with by courts of law. He is detailed and specific. What kind of a crime is witchcraft, which courts are competent to deal with it, what is necessary to have a charge of witchcraft brought into court, who may give evidence and what value can be placed on that evidence, and under what circumstances torture may be used are only some of the major points he deals with. He also takes into account other considerations: the possibility that accusers or witnesses could be lying, the difficulties in establishing whether an accused or a witness has a good or bad reputation, and the weight which should be given to this point – whether the charges involve heresy or not. Are clerics who are accused and convicted of practicing magic to be punished the same way as lay folk? Should witches who have not killed anyone be executed? Should old age in the accused be taken into account when punishment is in order? In the case of those sentenced to death, can they be given the Holy Sacrament? What should happen to their corpses? What of those who die in prison before or after sentence has been pronounced? What happens in the event of an acquittal? On one point, however, Del Rio is decided. The crimes alleged of witches are not fantasies, so those who raise that possibility are mistaken.

Finally in Book 6 Del Rio turns to the duties of priests faced by the practice of magic by their parishioners. Confession, both sacramental and legal, and then the questions, first of whether it is permissible for someone to use counter-magic to alleviate or destroy the effects of hostile magic directed against her or him and second whether one may ask a magical practitioner to remove or destroy an object one suspects may be causing effects harmful to oneself or others or whether one may remove the object oneself, receive detailed consideration. The answer to the former is no, and to the latter, yes. But the Church herself provides a wide variety of ways with which to counteract and do away with the effects of hostile magic, and it is to these one should properly turn in the event of need.

Innovative and Original Aspects

Thus Del Rio ends his wide-ranging, definitive account of what magic is, what part it plays in human society, and how it may be dealt with legitimately and effectively. Del Rio spends a great deal of his time and effort upon “superstition” and what he calls “vain observance,” that is, the performance of pseudo-religious actions which have no value at all. In this he is at one with his contemporaries, both Catholic and Protestant, for whom the cluttering of religious worship with verbal and operative excrescences was one of the main features of their contemporaries’ behavior which needed vigorous reform. His topics were not new to him, of course. St Thomas Aquinas, for example, had dealt with this topic earlier, defining superstition as either service to God in a manner which was in some way incorrect or inappropriate or as service to some false deity expressed in ways which should have been directed to God alone, and Del Rio repeats this formulation, many of the examples he provides illustrating one or other of these definitions. Kramer’s *Malleus Maleficarum*, too, had devoted one of its Books to the technicalities of the court room, although Del Rio goes into more detail, his discussion being informed partly by his many years’ experience as a jurisconsult in a variety of different nationalities’ administrations and partly by his extensive knowledge of the relevant legal literature. But his panoramic approach to the subject is ultimately his own and the skill of his treatment unmatched by anyone else. *Disquisitiones* is dedicated to Prince-Archbishop Ernst of Bavaria, an ardent supporter of the Counter-Reformation, who in the 1580s held several bishoprics in the northwest of Germany and was active in combatting the spread of Calvinism in the region. Hence, almost certainly, his attraction for Del Rio. The first edition (1599–1600) is prefaced with two poems, one (a somewhat perfunctory puff) by Justus Lipsius, recognized in Europe as an important philologist and historian and a personal friend of Del Rio, the two probably having met first at Leuven, and the other (a pedestrian attempt at humor) by Heribert Rosweyde. The manuscript of *Disquisitiones* must have been completed early in 1598 because

the first two Books received the official approval of Del Rio’s Jesuit superiors on July 6 1598, and this was followed by the censor’s approval on February 8, 1599. Del Rio’s own dedicatory epistle is dated to the same month, and publication of that first volume quickly followed. 1599 saw the necessary approvals granted to the four remaining Books which were published in two more volumes in 1600, all three volumes coming from the press of Gerard Rivius in Leuven.

Del Rio’s preliminary reading for this major work is impressive, even by the standards of the scholarship of the time. Apart from references to or quotations from many classical authors, Fathers of the Church such as St Augustine and St Thomas Aquinas, and Medieval theologians and natural philosophers such as Thomas of Cantimpre, Del Rio made extensive use of contemporary writers who dealt in some way with magic, and a notably large number of physicians whose views on witchcraft and its allied phenomena were of increasing importance to theological discussion of the subject. Andrea Cesalpino, Giovanni Codronchi, Jean Fernel, Giovanni Mercuriale, and Adolf Scribonius, for example, all contributed to the formation and formulation of Del Rio’s ideas, even if, as in the case of Scribonius, he disagreed with them. So it is noticeable that when he refers to magic and witchcraft in his dedicatory epistle, he calls them a disease (*pestis*) – “I have seen it, been troubled by it, and, with many people’s approval, have tried to make a medicine for this illness.” Not that this medical terminology was a clichéd metaphor. Rather, Del Rio meant it as an actual diagnosis. He did not, however, see witchcraft as a product of mental disorder as we might be tempted to understand it, and he rejected any hint of this from his reading, *De praestigiis daemonum* of the Lutheran physician Johann Wier, for example. Rather, he followed where others had gone before: Giovanni d’Anania, a Calabrian theologian, who maintained that demons can and do cause human illness, and Heinrich Kramer in *Malleus Maleficarum*, who had pointed to physical infirmities of all kinds – skin disease, blindness, sharp pains, bodily contortions – which demons, with God’s permission, had both wish and power to inflict. Disease thus served as a metaphor for the

corruption of a person's soul and as an actual description of its effect upon the body caused by both heedless and deliberate contact with and use of practices which could and did allow demonic access to that soul. In both senses, then, disease provided an illustration of how spirit entities could and did affect the physical world in deleterious ways.

Another group of authors consulted by Del Rio was, not unsurprisingly, given his own past history and the nature of the subject, writers on the theory and application of the law, both canon and secular. Del Rio's acquaintance with their books appears to have been extensive. They include discussions of the law in general, such as those by Claro, Bossi, Farinacci, Menochio, and Grammatico and those which dealt specifically with the particular problem of witches. Here many of the writers in question were known to have had personal experience of witch trials – Paolo Grillando, Nicolas Remy, Jean Bodin, and Johann Godelman are among the best known names. Some, such as Andreas Alciati and Gianfrancesco Ponzinibio, had expressed reservations about aspects of witch behavior, a witch's flight to the Sabbat and the reality of the Sabbat itself, for example. Del Rio clearly owes much to these jurisconsults, whether he builds on their propositions, such as Grillando's careful distinctions between various kinds of proof, or takes a different view, as when he disagrees with Farinacci about the extent to which a judge may vary punishments laid down by law. He also makes frequent use of works by fellow Jesuits. Juan de Maldonado's lectures on evil spirits had stayed with him, presumably in the form of notes as well as memory, since the early 1570s, but Peter Binsfeld's treatise on the confessions of male workers of harmful magic and witches was more recent (1589), as was Benito Pereira's *Adversus Fallaces et Superstitiosas Artes* (Against Deceptive and Superstitious Practices) (1591), both of which actually endorsed certain aspects of magic while casting doubts on others. Pereira, for example, distinguished between natural and demonic magic, and Binsfeld was dubious about the so-called Devil's mark and witches' ability to change their own shape. Reports from Jesuit missionaries also gave Del

Rio invaluable illustrative and confirmatory material from remote parts of the world – Luis Froes from the Indies and Japan in 1595 brought him right up to date – while historians such as Felix Haemmerlin, Olaus Magnus, and Nicholas Sanders furnished more.

Had Del Rio actually read all these sources? Scholars often tended to reproduce the material they found quoted by others, thereby providing a ready-made set of references for their literary successors, but even if one takes this into account, it is clear that Del Rio's use of his sources was carefully tailored to the development of his themes and not merely reproduced, relevant or not, from an earlier work. He is also frequently careful to give exact references, thus letting the reader know exactly where to turn so that quotations or references can be checked and seen in context. Caveats apart, therefore, his reputation for extensive learning therefore seems in large measure to be justified. But Del Rio did not rely entirely upon secondary written sources for his discussions, and every so often one finds a brief reference to or short anecdote taken from his own experience, as well as material derived from conversations with others. Thus, he remembers meeting a boy in Madrid in 1575, who seems to have been acting as a medium for a group of treasure seekers; he tells us of his discussions with Jean van Helmont on Kabbalah in 1594 and of his hearing, from one of the judges in the case, the details of the notorious trial of Jean del Vaulx in 1597, a monk who had been accused of practicing diabolical witchcraft in the Abbey of Stavelot and willingly poured out confessions of his magical activities. The enormous amount of disparate material which went into making *Disquisitiones* raises the questions of Del Rio's working methods. Without a modern card-index system, putting that material into comprehensible and useable order must have presented a challenge. One is reminded of Pliny the Elder who single-handedly wrote an encyclopedia of the natural world in the first century AD. He certainly had notebooks of some kind and arranged his references and quotations therein in such a way that he could draw upon them with relative ease when writing each book of his magnum opus. Presumably Del Rio had some similar system, for *Disquisitiones* is not

a rambling or vagrant work, but one which is under the tight control of its author, and therefore, its readers find it clear and easy to follow.

The structure of *Disquisitiones* and the arrangement of its material thus bear marks of an individual approach rather than any working to a formula. Kramer's *Malleus Maleficarum*, of course, could have provided a major pattern for any subsequent writer on witchcraft and magic, such as Del Rio, to follow. It is divided into three parts, the first addressed to theologians, the second to preachers, and the third to judges. But for the most part, it deals with witchcraft and witches, so its range is considerably less than that of *Disquisitiones*, although its acceptance of the reality of witchcraft as a threat to the spiritual welfare of humanity, its alliance of witchcraft with heresy, and its provision of detailed consideration of the legal means of eradicating magical practitioners are, in general terms, similar to Del Rio's later views. Del Rio, however, is a good deal more subtle than Kramer, partly because he was more learned and partly because the spacious reading which contributed to his scholarship assisted him to make more nuanced judgements of the multifarious problems he was discussing. *Malleus* thus offered Del Rio an entry into the subject, if he needed one, and a large amount of illustrative material which he certainly used. But he did not use Kramer's work as a blueprint and structured his panoramic view of magic and allied subjects along different lines. *Malleus* was not a manual in itself, but rather three extensive essays on witchcraft addressed to three allied but separate groups of officials. *Disquisitiones* is arranged according to topic rather than intended audience and its final addresses (Books 5 and 6) to judges and confessors segue naturally from Del Rio's previous wide-ranging, theologically based surveys of magic as a whole, to form a logical coda to what was clearly conceived as a single work of definition and disputation.

Impact and Legacy

Del Rio's book arrived just at a point where prosecution of witches in Europe, and in parts of

Germany in particular, had almost reached its height and, as was perhaps inevitable, was beginning to produce a reaction. Learned debate centered upon the University of Ingolstadt which in 1590 had issued an official opinion on the best way to suppress witchcraft while avoiding any possible errors in so doing. Ten years later, in April 1601, the university was invited to consider the question again, and this time the debate lasted for more than 3 years, ranged more widely, and took opinions from a variety of institutions and individuals, including the universities of Dillingen (largely a Jesuit institution), Freiburg, Padua, and Bologna, and prosecuting territories such as Lorraine, Mainz, Trier, Köln, and Baden. Del Rio, as might be expected now that he had become the latest and most impressive published commentator on the subject, and Nicolas Remy whose personal experience as a judge in witchcraft cases was extensive were also asked to contribute, and in subsequent editions of *Disquisitiones*, Del Rio included an account of the arguments he and others had offered. These renewed academic efforts to reconcile varying opinions from both legal and theological standpoints had an immediate and a long-term impact, for from them developed an increasingly strong opposition to the wholesale prosecution of witches, although Del Rio's views remained stern, rooted in his firm conviction that witchcraft was a real phenomenon and therefore to be resisted with all the force at the state's and Church's command.

The later editions of his work give an indication of its popularity and influence. There were 25 of them altogether, 4 of which, apart from the original, he was able to revise and expand himself. The rest appeared at frequent intervals throughout the seventeenth century, the last coming from Köln in 1755. It largely replaced Kramer's *Malleus* as the standard work of reference. Indeed, as early as 1600 it seems to have lain on the desk of the judges who were conducting a witch trial in Bavaria. Benedict Carpzov whose *Practica Nova Rerum Criminalium* (1635) became the standard work of criminal law throughout much of the Holy Roman Empire made use of Del Rio's arguments in relation to the prosecution and punishment of

witches; Calvinist Scotland deferred to him in 1672 and 1678 as a prime source of information, while in a major witch trial in Edinburgh in 1697, the defense advocate employed him to support his pleas for the defendant; and Johann Heinrich Zedler's 68 volume encyclopedia (1731–1754) still regarded him as a weighty figure in the field of occult studies. Nevertheless, as witchcraft trials gradually disappeared from Europe, so too did the need for and interest in their proponents and opponents, and so Del Rio's work and reputation faded, too. *Disquisitiones* has remained obscure ever since, while Kramer's *Malleus* has been revived and has acquired fresh notoriety. This is partly because of the comparative lengths of the two works. *Malleus* is no longer than the average monograph, whereas *Disquisitiones*, because of its much broader canvas, presents a more unwieldy challenge to publishers. *Malleus* is also a much more sensational work. Its many anecdotes and forthright hostility to witches lend themselves to misapprehension as well as enlightenment about this aspect of the past, and the longevity of the Montagu Summers English translation has allowed Kramer's work a second life, even if that life has been fraught with dislike and disapprobation. Locked in Latin in an increasingly Latinless age, Del Rio's much better, much more subtle, much better argued, and much more engaging opus has thus largely escaped the admiration and opprobrium which, it may be thought, are both its due.

Robortello, Francesco

Born: 9 September 1516

Died: 18 March 1567

Javier Patiño Loira

University of California, Los Angeles, CA, USA

Abstract

Francesco Robortello lectured at the universities of Lucca, Pisa, Venice, Padua, and Bologna from 1543 until his death in 1567. With a focus on language disciplines, Robortello sought to restore a methodical and organic understanding of Aristotle's philosophy, in reaction to what he perceived as a fragmented and restricted understanding of it that prevailed among his contemporaries. Robortello availed himself of diagrams and visual aids in order to render visible the relations among different parts of a discipline. Crucial among his contributions was his revision of the theory of the topics of argumentation. In 1548, he submitted

to the press the first commentary ever printed on Aristotle's *Poetics*, which immediately became a point of departure for subsequent scholarship on the topic. In several works, Robortello argued for a reconceptualization of rhetoric as a tool for making ethics and politics comprehensible to popular audiences. Robortello attributed to history a similar function in the community. Also, anticipating future developments in the discipline, he viewed history not only as a mere account of facts, but also as the explanation of ancient customs, laws, and institutions, drawn from documents and public records. Robortello authored the first treatise ever printed on textual criticism, partially siding with the ideas of Piero Vettori, and actively contributed to classical scholarship through the edition of ancient Greek texts, such as Aeschylus' tragedies, the military treatise by Aelianus Tacticus, and the tract *On the sublime* by Pseudo-Longinus.

Biography

Born in Udine, Italy, in 1516, Robortello first studied under Gregorio Amaseo and then moved to Bologna to pursue his education with the son of Gregorio, Romolo Amaseo (Vanek 2007). Starting 1538, he lectured in Lucca, producing a volume of *Variarum locorum annotationes* on Greek and Latin authors that he published in 1543. Robortello's first contribution was well-received and was reprinted in Paris the following year. Thanks to his growing reputation and his contacts with part of Florence's intellectual elite, in 1543, Robortello was appointed to the chair of Humanities at the newly reopened studio of Pisa, following the renunciation of Giambattista Adriani (Blocker 2004).

In 1548, Robortello published a miscellanea of rhetorical, historiographical, and antiquarian contributions, and supervised the reprint of his 1543 *Annotationes*, augmented by a second book. He also issued the first ever printed commentary on Aristotle's *Poetics*, a career-making work that originated in his lectures of 1545 at Pisa and underwent a second edition in 1555 (Sgarbi

2019). Robortello's focus on the *Poetics* materialized at a time in which Aristotle's treatise had become the object of lectures by Bartolomeo Lombardi in Padua (1541) and Vincenzo Maggi in Ferrara (starting 1543), and had attracted some attention from Piero Vettori, who, apparently, did not appreciate Robortello's efforts (Bionda 2014). In 1549, and against the competition of Bernardino Partenio and Francesco Luisini, Robortello obtained the chair of Latin and Greek at the Scuola di San Marco in Venice (Cappello 2009). A clash with Giovanni Battista Egnazio, the previous occupant of the chair (Venier 1998), was followed by an open conflict with Maggi, whose 1550 commentary on the *Poetics* attacked with virulence many of Robortello's interpretations.

In 1550, Robortello delivered a lecture before the senate of Venice, proposing a republican, anti-tyrannical reading of Aristotle's *Politics* (Blocker 2004). Beginning in 1552, he occupied the prestigious morning chair of Latin Rhetoric at the University of Padua, vacated by Lazzaro Bonamico (Grendler 2002). That year, Robortello published an edition of the tragedies of Aeschylus with Greek *scholia*. He may have been the first to realize that the play that the manuscript *Laurentinus* 32.9 introduced as Aeschylus' *Agamemnon* was in fact two different plays. Robortello saw that a large lacuna at the end of the *Agamemnon* concealed the beginning of a different play, Aeschylus' *Coephorai* (Carlini 1989). That same year, Robortello issued the *editio princeps* of Aelianus Tacticus' *On Tactical Arrays of the Greeks* accompanied by his own Latin translation, as well as a set of engraved diagrams that revolutionized the scholarly tradition on that work (Hale 1988). The *editio princeps* of Pseudo-Longinus' *On the sublime* followed in 1554.

Robortello's tenure in Padua coincided with the first stage of what later would become a harsh controversy with Carlo Sigonio. Despite his criticism of Robortello's treatise *De nominibus Romanorum* (1548), Robortello still endorsed Sigonio to be his replacement in Venice once that he left for Padua in 1552. However, tension eventually escalated, with the two scholars

accusing each other of incompetence in matters of antiquarian studies and textual criticism (McCuaig 1989; Vanek 2007). Sigonio was, with Manuzio, Maggi, and Henri Estienne, one of the targets in Robortello's *De arte sive ratione corrigendi antiquorum libros* (1557), the first ever published treatise on textual criticism.

In his *De convenientia Supputationis Livianae annorum cum marmoribus Romae quae in Capitolio sunt*, Robortello condemned Sigonio's opinion that Livy's chronology was at odds with the lists of magistrates contained in the *Fasti Capitolini*, unearthed in Rome in 1546. The bitterness of the conflict, in which posterity has proved Sigonio right, might have prompted Robortello to accept the prestigious chair of Humanities at the University of Bologna, vacated by Sebastiano Corradi, himself the successor of Romolo Amaseo (Grendler 2002). In 1559, Robortello published the funeral oration for Charles V that he had delivered at the College of Saint Clement, as well as a treatise *De vita et victu populi romani*, originally intended as an index for a work on the life and the institutions of ancient Rome that never materialized. In 1560, Robortello issued a miscellaneous volume of rhetorical works entitled *De artificio dicendi*, published again posthumously in 1567.

In 1561, the senate of Venice called Robortello back to Padua, where in addition to rhetoric and poetry, he also taught moral philosophy (Grendler 2002). Sigonio was teaching there too, and Robortello's return reignited the fight. The senate of Venice allowed Sigonio to lecture in the morning in concurrence with Robortello, rather than demoting him to the less prestigious afternoon session. It was then that they started hanging posters to discredit one another. A series of disputations posted by Sigonio and published in a volume of *Disputationes Patavinae* appeared in the spring of 1562. They found response within a few months in Robortello's *Ephemerides Patavinae*, which, in turn, was met by Sigonio's reply. The climate was hostile. Cardinal Girolamo Seripando was unable to reconcile them, and Sigonio and his followers ended up covering the walls of the university with poems against Robortello. The dispute ended abruptly in 1563, when Sigonio

secured a position in Bologna (McCuaig 1989). Focused on reconstructing the system of ancient disciplines of language and reasoning, Robortello saw Sigonio's understanding of antiquarianism as a mere accumulation of random facts about the past. The two scholars looked at antiquity with entirely different aims, as was comically summarized in a poem that someone, probably a follower of Robortello, wrote on one of the extant copies of his *De arte sive ratione corrigendi*. It depicts Sigonio becoming pale, sweating, and crying as he sees Cicero's *Topica* and asks: *What book is this?* (Venier 2012).

Robortello remained in Padua for the remainder of his years. Starting 1565, a group of scholars met at his place to study Greek. That same year, Flaminio Filonardi contacted him on behalf of Cardinal Alfonso Caraffa to commission from him a biography, which he never wrote, intended to restore the damaged reputation of the late Pope Paul IV (De Maio and Romeo 1965). Robortello died of pleurisy in 1567.

Heritage and Rupture with the Tradition

Robortello declared that it was his aim to find a definite order and method (*ars et ratio*) that would render visible, for each of the disciplines of language, the relation among the parts, and between the parts and the whole. He mobilized visual aids (with shapes ranging from traditional tree diagrams, such as those he used to teach rhetoric in Venice in 1549, to a panpipe) to help his readers visualize synoptically the network of connections that made up a field of knowledge. As in a map, students would locate each question under a heading (Bolzoni 1995). The eye was expected to discern in the diagram the paths used by the mind to produce knowledge (Garavelli 2014; Sgarbi 2016, 2019).

Robortello's focus on method pursued to restore Aristotle's philosophy as a system, reacting to what he saw as the partial and fragmentary interpretations of the philosopher's thought available at the time. He argued that, by paying attention to universals (which are better known to the mind), philosophy served Aristotle

as a vantage point from which he could look into the particulars of each of the fields he studied (Robortello 1548b).

Robortello's fascination with "method" is most evident in his revision of the topics of argumentation, found in the four manuscripts that preserve his *Discorso dell'origine, numero, ordine et methodo delli luoghi topici*, which might have originated as a lecture delivered in his own home (Sgarbi 2019). There, Robortello criticized Rudolf Agricola's theory of the topics. According to him, Agricola had failed to follow Aristotle's understanding of the topics, which required that these be deduced from the relations through which the mind naturally operates. As a result, Agricola's topics were useful for the invention of arguments, but were of no use to judge their validity. Robortello claimed that he had restored the unity of invention and judgment by deriving the topics, not randomly, as he claimed that Agricola had done, but following the four problems that can be asked about a subject according to Aristotle's *Posterior Analytics* (Sgarbi 2015; Sgarbi 2019).

Robortello's commentary on Aristotle's *Poetics* (Robortello 1548b) also adopted a methodical and transdisciplinary approach, and represented a crucial step in the introduction of Aristotle's tract into mainstream theoretical and practical discussions on the art of poetry. Robortello used three different manuscripts to emend the Greek text published in 1536 as part of the same volume that included Alessandro de' Pazzi's Latin translation of the *Poetics* (Donadi 2001). Robortello divided Aristotle's treatise into 270 parts, which he illustrated through his knowledge of the language and of ancient customs, institutions, history, and poetry. Robortello introduced his commentary as a reaction to the focus on Aristotle's natural works that prevailed among his contemporaries. He defined a spectrum for the disciplines of language and reason, which encompassed demonstrative logic, rhetoric, and poetics as pieces of a single system. Logic stood at one end, closest to truth and furthest removed from poetics, the art of lying. Rhetoric (the realm of the credible) lay in between the two. The identification between poetics and untruth was in line

with the characterization of poetry as a "true lie," advanced by Plato's commentator Proclus (Blocker 2004). At the same time, the classification of poetics and rhetoric as logical arts mirrored Al-Farabi's division of the sciences, disseminated via the Latin translation of his works prepared by Dominicus Gundissalinus in twelfth-century Toledo and repeated as recently as Girolamo Savonarola's posthumous 1534 *Compendium totius philosophiae* (Hardison 1997). Despite a series of ambiguous remarks about Averroes' commentary of the *Poetics* (which Robortello read in Hermannus Alemannus' 1256 Latin version, first printed in Venice in 1481), he borrowed from it abundantly (Weinberg 1961; Wels 2009).

Robortello supplemented his commentary of the *Poetics* with five treatises dealing with specific genres that Aristotle had left out of his consideration. The rationale behind Robortello's decision was his belief that, if the treatise (like all of Aristotle's works) responded to a coherent method, it was therefore possible to conjecture what the philosopher left unsaid or was lost, by reconstructing the part that was extant. Robortello's addition was also symptomatic of the rise of a genre-specific reflection that was characteristic of sixteenth-century poetic theory (Javitch 2001).

Aristotle held that poets are builders of plots, chains of actions linked to one another "imitating" the way things happen, either always or for the most part. Plots are particular, but embody relations that are true and universal in a way that makes poetics "more philosophical" than history, which is concerned with factual truth. Robortello departed from Aristotle by identifying truth with factual truth, and by equating lie, which he made the province of poetics, with that which is non-factual. This led him to conclude that poets move the audience in as much as they are persuasive about the actions they "imitate," but, of necessity, they do so to a lesser degree than the historian (Sgarbi 2019). Unlike Aristotle, Robortello precluded actual events from entering a poem's plot. The only exception would be when a poet avoids the charge that he is stealing the role of the historian by balancing the actual facts included in the plot with fictitious events taking place in the secondary episodes.

Robortello's approach to Aristotle's *Poetics* was essentially rhetorical (Weinberg 1952, 1961; Javitch 2008). He explained that poetics provides the audience with examples, particular embodiments of ethical truths. In connection with this, Robortello was the first to grant centrality to Aristotle's assertion that the end of tragedy is the purgation or catharsis of passions through pity and fear. Taking inspiration from the eighth book of Aristotle's *Politics*, Robortello argued that tragedy frees the spectators from any excess of emotions. As they experience pity and fear at the misfortunes of others, they become better prepared to bear the ills of life (Loscalzo 2003; Blocker 2004; Sgarbi 2019).

Robortello's theory of poetics intersects at various points with his views on rhetoric and logic. Reacting against the conception of rhetoric as a discipline that taught how to speak persuasively about any given topic, Robortello considered that it was the orator's duty to render ethical and political notions understandable to the common people, who lack the preparation that is necessary to the understanding of scientific discourse. With this in mind, orators prioritize inference and examples, metaphors, and copiousness. They prefer particular over universal terms, and, for that purpose, they argue from enthymemes that elide the universal premise, which nonacademic audiences find more difficult to follow (Sgarbi 2016, 2019).

Robortello's views on history writing are contained in his tract *De historica facultate* (1548), his commentary on the *Poetics*, a letter he wrote in Venice in 1551 (Robortello 1548a, b, 1843), as well as his oration *Praefatio in Cornelium Tacitum* (1566). Robortello set out to counter the claim, advanced by the skeptic philosopher Sextus Empiricus, that history cannot have a method because it is made of an indefinite accumulation of facts that cannot be reduced to unity (Ginzburg 2006). In an attempt to demonstrate history's status as an art, Robortello chose to repurpose Cicero's claim that it is part of rhetoric. History's association with rhetoric might be behind the fact that *De historica facultate* advocated the use of speeches (*conciones*) invented by the historian according

to verisimilitude. However, in 1551, Robortello nuanced his stance, suggesting that eyewitness accounts would better inform about harangues or orations actually delivered by the agents in a particular situation. Likewise, Robortello's statement that the historian should avoid praising or blaming actions, leaving for the readers to use their own judgment, seems to indicate a similar departure from a narrow identification between history and rhetoric.

More importantly, rhetoric informs history's characterization as a civil science oriented towards the good of the community. History deals "with usages and methods of government," that is, with ethics and politics. The historian explains customs to his readers and makes them familiar with the structure of the body politic, the way to appoint magistrates and conduct trials. He resorts to disciplines that are auxiliary to politics; he masters the military art and also the description of places. Robortello anticipated some of the transformations in the discipline to be later formalized by his disciple Francesco Patrizi and by other scholars, such as Jean Bodin and François Baudouin. These would see history as a gate to understanding ancient ways of life, political structures, laws, warfare, and other aspects contained in the notion of "pragmatic history," embodied by the recently rediscovered works of Polybius – whom Robortello nevertheless faulted for treating the explanation of such topics as independent treatises, rather than in connection with the events they illustrate. Robortello's remark echoed the criticism of many of his contemporaries, who feared that Polybius's digressions and encyclopedism might transform the historian into a philosopher.

For Robortello, the particulars depicted by the historian enable the readers to abstract the laws that govern nature and human behavior. This makes them prudent, capable of judging present events, and foresee future incidents. Pointing to Aristotle's *Poetics*, Robortello defined history as "the narration or explanation of events in the way in which they took place." Since history is about truth, it keeps the names of the agents and looks for them in official documents, public records, and material remains of

the past – stones and inscriptions, which keep for the present the traces of ancient characters and deeds. Robortello insisted that history be made up of public events. Nothing private should be of interest unless it results in consequences for the state.

Robortello's tract on textual criticism, *De arte sive ratione corrigendi antiquorum libros disputatio*, offered a path to restore "the pristine splendor" of ancient authors (Robortello 1975). Robortello took sides with Piero Vettori and thus confirmed the legacy of Angelo Poliziano against the approach of Marc-Antoine Muret and Paolo Manuzio (Vanek 2007). Following Vettori, Robortello claimed that the emendation of a text should be based on alternative readings found in reliable manuscripts rather than conjecture. He insisted on the faithfulness (*fides*) required from the textual critic, who is expected to identify the format, script, and location of the manuscripts where he has found the readings he has chosen to favor. This is supposed to certify fellow scholars about the origins and motivations of any particular emendation. For Robortello, the critic needs to be instructed in antiquity. He should be familiar with the grammarians who codified the language and the authors who put it into practice in the period in which the text was written. This enables the critic to emend mistakes derived from the ignorance of early scribes regarding ancient history, the script, the grammar, or the vocabulary. Although Robortello's treatise was close to Vettori's ideas, he deviated from the latter's principles by leaving more room for conjecture, which he praised as a proof of wit and classified under eight types that mirrored the division of words found in Aristotle's *Poetics* (Venier 2012). In his practice as an editor, Robortello deviated even more from some of Vettori's guiding principles, and sometimes he was not up to the standards of faithfulness he praised in his model (Bionda 2014), preferring philologically restored manuscripts over less manipulated ones and generally neglecting the genealogy of the witnesses preserving a text (Carlini 1989). In some cases, he even departed from a reading in the manuscript in order to defend alternative

options that were better suited to his own expectations about the style of a particular author (Angioni 2011).

Innovative and Original Aspects

Impact and Legacy

Robortello's controversies with Sigonio, Maggi, and others contributed to creating a "black legend" that survived him for centuries (Cappello 2009). The impact of his works remains nevertheless beyond doubt. His commentary on Aristotle's *Poetics* was the basis for Bernardo Segni's pioneering Italian translation (1549) and opened up a new field of studies. Robortello's commentary was annotated, followed, or attacked by virtually any scholar of poetics from Torquato Tasso to Lope de Vega and Pierre Corneille (Weinberg 1952). *De historica facultate* was included in Johann Wolff's anthology *Artis historicae penus* (1576, 1579), a collection that remains central to understand the critical transformations experienced by historiography in the sixteenth century. Robortello's art of textual criticism became a precedent that Caspar Schoppe deemed worthy of reprinting in his *De arte critica* as late as 1662. Even Robortello's revision of the topics of argumentation, preserved in manuscript, would reach a wider public through Orazio Toscanella's *Applicamento* (1575) and Antonio Riccoboni's often-reprinted *Ars rhetorica* (1579) (Sgarbi 2019).

Abstract

The Rosicrucian manifestos *Fama fraternitatis* (1614) and *Confessio fraternitatis* (1615) conveyed Johann Valentin Andreae's utopian call for the reformation of science and society. However, although their appeals to experimentally based natural magic have been portrayed in terms of a "Rosicrucian" proto-Enlightenment, the manifestos also convey the inspirationism of Paracelsian theology and the magic of the Florentine Platonists (Ficino, Pico) received via Agrippa's overtly supernatural "magical Reformation." These conflicting ideological tendencies also characterize the content of the numerous apologetic tracts that appeared in the wake of the manifestos' publication, as diverse confessional voices vied to define the "true" Rosicrucians on the eve of the Thirty Years' War. While the utopian fraternity portrayed in the manifestos seems to have been a purely fictitious ideal, the Rosicrucian trials of the early war years reveal the emergence of large networks of self-described "Rosicrucian" inspirationists, thus heralding the dawn of a major current of Western esoteric religiosity.

Introduction

The publication in Calvinist Hessen-Kassel of the anonymous *Fama fraternitatis* (1614) and *Confessio fraternitatis* (1615) announced to Europe an imminent Reformation instigated by the Rosicrucian fraternity, an order of "true

Jesuits" in possession of the secrets of alchemy, magic, and the Christian Cabala. According to the manifestos' fictitious millennialist narrative, these secrets had recently been brought to light by the rediscovery of the tomb of the fraternity's founder, "Brother C. R." (Christian Rosenkreuz). With their powers, the brethren promised to end Catholic hegemony within the Holy Roman Empire, overthrow corrupt "Roman" Scholasticism as the dominant scholarly paradigm, and establish the essential unity of Biblical teachings and a pagan (i.e., Platonizing esoteric) *prisca sapientia*. The manifestos' ingenious synthesis of legend, prophecy, and historical events provoked a storm of sympathetic apologies and opposing polemical tracts (*Kampfschriften*) as diverse confessional voices advanced their own visions of the true fraternity. While it could be argued that the authors of the manifestos constituted a "Rosicrucian" brotherhood of sorts, genuine secret societies of self-described "Rosicrucians" had emerged within a few years of the manifestos' publication.

The Authorship and Doctrinal Orientation of the Manifestos

Early Rosicrucianism cannot be described as an ideologically unified "movement" or "culture" (Yates 2013, ix, xiii). This is true not only of the early reception of the manifestos' message within the virtual arena their publication created but also of the manifestos themselves, which evince two conflicting doctrinal tendencies (Tilton 2014). This tension within the texts reflects a broader struggle to define religious orthodoxy within a Christendom left ideologically splintered by the Reformation.

Above all the manifestos give expression to a super-confessional religious orientation derived from the theological works of Paracelsus (1493–1541), which circulated in manuscript form among his followers in the sixteenth and seventeenth centuries. Referred to as the *Theophrastia sancta* by the early Rosicrucian apologist Adam Haslmayr (Gilly 1994b, 450), this Paracelsian orientation was anti-institutional and inspirationist and inclined to supernatural magical practice. Echoing

the medieval movement for apostolic poverty, Paracelsus sought to recreate a primitive apostolic community reflecting Christ's injunctions to the apostles (Luke 9.1-6, 10.1-9); an avowed pacifist, he condemned the interconfessional bloodletting committed by the "walled churches" (*Mauerkirchen*) under the sway of corrupt worldly powers (Gantenbein 2008, 33–34). In their stead Paracelsus promoted a church of the "inner human," its politically and confessionally divided congregation united in the Holy Spirit and ongoing divine revelation. Similarly, the Rosicrucian brethren of the manifestos spurn worldly wealth and dedicate their lives to the healing of the sick, free of charge; their meeting place is the "house of the Holy Spirit," where all souls impelled by the spirit of God congregate (*Fama fraternitatis* 1614, 106; *Confessio fraternitatis* 1615, 79–80). In accordance with the explicitly supernatural magic promoted by Paracelsus, Christian Rosenkreuz is said to have gained his knowledge through communication with angels and elementary spirits (*Confessio fraternitatis* 1615, 59–60; *Fama fraternitatis* 1614, 97); a demonic hierarchy is represented upon the floor of his tomb, and the brethren guard the names of these "lower rulers" lest they be misused (*Fama fraternitatis* 1614, 115–116).

Yet the inspirationist and supernatural magical elements of the manifestos are at odds with their explicit description of the brethren's faith. Thus the *Fama fraternitatis* distinguishes the fraternity from "all enthusiasts (*Schwärmer*), heretics, and false prophets" and states the brethren partake of two sacraments as "the first reformed Church" employs them (*Fama fraternitatis* 1614, 121–122). Although these statements suggest the fraternity is Lutheran, hostile respondents to the manifestos felt free to refer to "the Calvinist-Rosicrucian brethren" (Germanus 1626, 92). License for such a characterization had been given by the catalogues of the Leipzig and Frankfurt book fairs, which had advertised the manifestos as "German theological books of the Calvinists" because they were published at Kassel with the specific authorization of the Calvinist landgrave Moritz of Hessen-Kassel (1572–1632) (Tilton 2003, 118).

Both ideological sympathy and political expedience motivated the support initially expressed in

some ruling Lutheran and Calvinist quarters for the manifestos' program. In the *Fama fraternitatis*, the brethren declare they will grant a future emperor their vast store of alchemically produced gold, as "Europe is pregnant and will bear a strong child who must have a great christening gift" (*Fama fraternitatis* 1614, 109); likewise, the markedly millennialist *Confessio fraternitatis* prophesies the coming of a "lion" who will use the brethren's treasures to "fortify his empire" amid the "final downfall" of the papacy (*Confessio fraternitatis* 1615, 66, 69). Respondents to the Rosicrucian manifestos identified this apocalyptic lion with a number of leaders championing the Protestant cause prior to and during the Thirty Years' War – most prominently the pretender to the imperial throne, the Calvinist Elector Palatine Frederick V (1596–1632).

The lion motif of the *Confessio fraternitatis* sheds light on the authorship of the manifestos, as it corresponds to a vision related by the Tübingen Paracelsian Tobias Hess (1568–1614) to his patron Friedrich I, the Lutheran Duke of Württemberg (1557–1608) in 1604. Within Hess' vision the eagle of the Holy Roman Emperor and the whore of Babylon – the papacy – are opposed by a lion whose roar shakes the world to its foundations (Gilly 1994a, 88). For Hess this defending lion was his own patron, who strove to bring the Lutheran states into closer alliance with the Calvinists; it was also the herald of the third age of the Holy Spirit foretold by Joachim of Fiore, which Hess predicted would arrive in 1620 (Gilly 1994b, 470).

Hess formed the focal point of an "intimate league of friends" in Tübingen that included the young Lutheran theologian Johann Valentin Andreae (1586–1654), the grandson of the editor of the Lutheran *Book of Concord* (1580) (Tilton 2003, 127). Today Andreae's involvement in what he came to describe as a youthful folly is well established (Brecht 1977, 286–290). Although a third party has also been implicated in the authorship of the manifestos (Gilly 2001, 28–32), their conflicting religious tendencies can be explained in terms of the respective worldviews of Hess and Andreae. Thus the supernatural magical practices they allude to stand in

stark contrast to Andreae's advocacy of a purely natural magic (Andreae 1618, 201–203). This natural magic is synonymous with the experimentally based mathematical and mechanical arts also practiced by the brethren depicted in the manifestos.

The Confessional and Intellectual Response to the Manifestos

Among the many competing visions of the “true” Rosicrucian fraternity that emerged in response to the ambiguous manifestos, the inspirationist Paracelsian interpretation is exemplified by Adam Haslmayr's *Antwort an die lobwürdige Brüderschaft der Theosophen von Rosencreutz* (1612). An early respondent to the manuscript manifestos, Haslmayr portrays the Rosicrucian brethren as harbingers of the millennium; their role is to illuminate the way for the Lion of Midnight (the subject of a pseudo-Paracelsian prophecy) with “the light of Christ and nature's sanctuary” (i.e., the Paracelsian lights of grace and nature) (Haslmayr 1615, 98). Haslmayr goes on to enumerate the elements of the *Theophrastia sancta* possessed by the fraternity: the Cabala, the “angels of good counsel,” the “necrolic” (life-preserving) alchemical medicine, the “sacred magic of Bethlehem,” the prophetic interpretation of heavenly signs through the *evestrum* or astral spirit, and the “blessed *nectromantia*” (revelation via scrying, divining, dreams, etc.) (Haslmayr 1615, 97–98). For his authorship of this *Antwort*, Haslmayr was condemned to many years' imprisonment by the Jesuits.

Haslmayr also refers in his apology to “Paul and the Cabalists or *Aniadi*” who remained after the Ascension to propagate Jesus Christ's teachings among the Jews and heathens (Haslmayr 1615, 88). The Paracelsian term *Aniadum* refers to the “celestial body” received from the Holy Spirit via the sacraments or alternatively to “*homo spiritualis* regenerated within us” (Dorn 1612, 42). Thus Haslmayr envisages the Rosicrucians as transfigured humans who have received the “seed” of Christ – a vision that draws not only from Paracelsus but also from Origen's reference

to “esoteric” teachings of Jesus disseminated by Paul to select initiates.

A number of other respondents to the manifestos also portray the Rosicrucian brethren as the inheritors of an esoteric magical tradition passed on orally by Jesus. A tract by the Christian Cabalist Julius Sperber (15??–1616?) dating to 1597 was printed as the *Echo der von Gott hocheleuchteten Fraternitet des löblichen Ordens R. C.* in 1615, together with an anonymous introduction dedicating it to the Rosicrucian fraternity (Sperber 1615, Diii verso-Div recto). In his tract Sperber depicted Jesus as a consummate exponent of the Cabala, which entails intoning the names of God in order to speak with angels, receive revelations, and ascend to the heavens to become one with God. Only members of the “magical college” instituted by Jesus understand the esoteric significance of the parables or have the ability to prophesy during the (Joachimite) age of the Son – and Sperber counts himself among their number, as he describes his use of an “archetypal mirror” in which he has attained the vision of the Merkabah (divine throne-chariot) and from which he has gained knowledge of the imminent age of the Holy Spirit and its new third Testament (Sperber 1615, 159–160, 172–175).

In his Rosicrucian apologies, Robert Fludd (1574–1637) also portrays the Cabala as the secret teaching of Christ, and like Sperber he derives the notion directly from Agrippa (Fludd 1633, 44; Fludd 1617, 28–29). Fludd's *Tractatus apologeticus integritatem Societatis de Rosea Cruce defendens* (1617) was directed against the anti-Paracelsian alchemist Andreas Libavius, an orthodox Lutheran who had written at length against the fraternity depicted in the manifestos. Libavius accepted that the parables of Christ possessed an esoteric significance, but he argued that the misuse of such symbolic language leads to just the sort of supernatural (and thus necessarily diabolical) magic advocated by the brethren (Libavius 1615, 283). He also castigated the fraternity for spreading its apocalyptic prophecies concerning the Lion of Midnight – such ideas were a dangerous spark that might ignite another Peasants' War (Libavius 1616, 13–14). In his reply to Libavius, Fludd defends the

practice of conversing with angels. He goes on to argue that the Rosicrucian brethren may well have foreseen the Second Coming in the supernova of 1604, just as the Magi once read the seal of Christ imprinted in the star they followed to Bethlehem (Fludd 1617, 25–26, 65). Moreover, the fraternity has knowledge of the dominion of the planetary angels or “world rulers” over historical epochs, a doctrine of Trithemius that Fludd also attributes to Jesus Christ (Fludd 1617, 130–138; *Confessio fraternitatis* 1615, 62).

The depiction of alchemical arts within the Rosicrucian manifestos gave rise to a class of apologetic tracts quite distinct from these inspirationist responses. The alchemical motifs of the manifestos do not amount to mere ciphers for inner, personal transformation (“spiritual” or allegorical alchemy); rather, they depict the laboratory pursuits of *chymiatría* (chemical medicine) and *chrysopoeia* (gold-making). Thus Christian Rosenkreuz – whose corpse remains “venerable and undecayed” – is said to have lived 106 years, while the fraternity’s great treasures of gold are a bywork (*parergon*) of their philosophy (*Fama fraternitatis* 1614, 124). Yet the manifestos also condemn those alchemical *Betrüger* (frauds) who swindle the gullible with “bizarre symbols,” “obscure language,” and misuse of the Holy Trinity – a reference to the printed works of Heinrich Khunrath (1560–1605), whose association of the Paracelsian *tria prima* (sulfur, salt, mercury) with the Trinity offended orthodox Lutheran sensibilities by blurring the boundaries between the natural and supernatural realms (*Confessio fraternitatis* 1615, 78).

It is likely those orthodox sensibilities belonged to Johann Valentin Andreae himself, as a very similar critique appears in the “third Rosicrucian manifesto” published under his name: the *Chymische Hochzeit: Christiani Rosencreütz, Anno 1459* (1616) (Andreae 1616, 46–47). This is the most famous work of Protestant alchemical allegory, a literary genre sanctioned by Luther’s own allegorical employment of alchemical symbolism. The *Chymische Hochzeit* portrays an alchemically conceived 7-day pilgrimage undertaken by Christian

Rosenkreuz, who attends a royal wedding and is admitted into an esoteric order governed by the virgin Sophia. The text’s symbolic depiction of the soul’s union with Christ reflects Paracelsian reception of the Wisdom literature, in particular the allegorical writings of Gerhard Dorn (Dorn 1659, 238–239).

Andreae’s allegory lies firmly in the tradition of Origen’s allegorizing interpretation of the Song of Songs. Nevertheless, it was reinterpreted as a veiled reference to laboratory alchemy in Rosicrucian apologies such as the anonymous *Practica leonis viridis* (1619) and Christoffer Rotbard’s *Elucidarius maior* (1617), which detected the “high secret of the blessed Philosophers’ Stone” within the opaque ciphers of both the manifestos and the *Chymische Hochzeit* (Rotbard 1617, 65–67). And although alchemy was only one element of the *prisca sapientia* possessed by the brethren of the manifestos, in his influential Rosicrucian tracts, the alchemist Michael Maier (1568–1622) portrayed it as their primary pursuit. In *Silentium post clamores* (1617), Maier argued that the fraternity’s failure to answer the many published requests for admittance should not be taken as proof of its nonexistence; rather, the brethren are merely observing the oath of silence kept by earlier “philosophical societies” such as the Pythagoreans, Brahmins, and Egyptian priests (Maier 1617, 26–46). From Maier’s mythoalchemical perspective, the chief arcanum of the fraternity and their forebears was the Philosophers’ Stone: hence in *Themis aurea* (1618), he argues the initials “R. C.” are in fact alchemical “hieroglyphs” and do not refer to a “rosy cross” (Maier 1624, 210–213; Tilton 2003, 171).

By proclaiming the “true” meaning of the fraternity’s laws, Maier wrote as if from the inside of an organized secret society; although he had no personal acquaintance with the Tübingen circle of Andreae, his aim thereby was to distinguish true Rosicrucianism from false and establish himself as the chief spokesman of the former. His success in this regard is evident from the words of the Jesuit polemicist François Garasse, who in his *La doctrine curieuse des beaux esprits de ce temps, ou pretendus tels* (1623) described Maier

as the secretary of a “pernicious company of sorcerers” threatening the church, the state, and good morals (Garasse 1623, 82–93).

The Rosicrucian Trials

With the heightening of sectarian hostilities and the outbreak of the Thirty Years’ War in 1618, Protestant states that had once tolerated or even tacitly supported the Rosicrucian phenomenon adopted draconian measures to ensure internal stability and social cohesion, leading to the persecution of those advocating an anti-institutional, inspirationist interpretation of the manifestos. In 1619 proceedings were initiated by the Lutheran Church in Württemberg against the Rosicrucian apologist Johann Faulhaber (1580–1635), who was condemned as an “enthusiast” and accused of being one of at least 70 “Rosicrucian brethren” communicating by letter and meeting in the region (Schneider 2005, 323). Soon thereafter Moritz of Hessen-Kassel himself oversaw proceedings against two men accused of being Rosicrucians: Philipp Heinrich Homagius and Georg Zimmermann. Among other heresies, the Calvinist inquisitors assembled by Moritz condemned Homagius, Zimmermann, and hundreds of alleged co-conspirators for their Paracelsian pantheism (“God is material and corporeal”) and their belief that the invisible church would be made visible at the dawn of the age of the Holy Spirit in 1621 (Hochhuth 1862, 113–120). They were also accused of disseminating supernatural magical manuals such as the *Arbatel* alongside the works of Agrippa, Paracelsus, and Valentin Weigel (Hochhuth 1862, 87–88).

Despite being sentenced to “perpetual imprisonment”, Homagius reportedly met with the Rosicrucian apologist Heinrich Nolle (158?–1626) in Gießen, the capital of Lutheran Hessen-Darmstadt, in December 1622. This meeting prompted their prosecution as leaders of “a new sect of enthusiasts”. While Nolle and Homagius fled its clutches, the Hessen-Darmstadt inquisition pitted the strictly Lutheran faculty of theology at the University of Gießen – whose duty was to prevent any further “reform” of the teachings of Luther –

against professors of medicine and law who had associated with the two “sect leaders” and had referred to themselves as “Rosicrucians” (Klenk 1965, 42, 54). Pointing specifically to Nolle’s portrayal of communication with angels in his allegorical *Parergi philosophici speculum* (1623), the Hessen-Darmstadt inquisitors found him guilty in absentia of enthusiastic inspiration in contravention of article five of the *Confessio Augustana* (Hochhuth 1863, 230–231).

The Legacy of Early Rosicrucianism

Following the Rosicrucian trials, historical traces of the “fraternity” – be it an organized secret society or an informal epistolary network – become infrequent. Nevertheless, there is evidence for organizational continuity among followers of Jacob Böhme in Amsterdam, a haven of relative religious tolerance. One early intermediary for this union of Behmenist and Rosicrucian currents was the Dutch engraver Michel Le Blon (1587–1658), an associate of Johann Arndt (1555–1621) and Abraham von Franckenberg (1593–1652) whose printed and manuscript works place supernatural magic within the framework of apocalyptic speculation on the seven angels of the Book of Revelation. By the later seventeenth century, the Amsterdam Behmenist-Rosicrucian tradition had coalesced around Ulrich Pfeffer (?–1680) and the Angelic Brethren of Johann Georg Gichtel (1638–1710); the doctrines and practices of this circle were passed down to later Rosicrucian groups (Asiatic Brethren, Golden Dawn, etc.) via the alchemico-Cabalistic grimoires of the powerful eighteenth-century *Gold- und Rosenkreuz* order (Tilton 2016).

Roussanos, Pachomios

Born: Zante c.1508

Died: Zante c.1553

Georgios Steiris

Department of Philosophy, School of Philosophy,
National and Kapodistrian University of Athens,
University of Athens, Panepistimiopolis,
Zografou, Greece

Abstract

Pachomios Roussanos was a seminal sixteenth-century Greek scholar. In addition to his work as a copyist and editor of manuscripts, he wrote numerous treatises on religion, ethics, and grammar. He was a leading theologian of his century and throughout his short life he defended the Orthodox dogma from the influences of Western European theology.

Biography

Roussanos was born in a small village of Zante, a Greek island in the Ionian Sea. His father became a monk and short after Pachomios followed in his path. He was self-taught. He traveled in mainland Greece and stayed for a significant period of time in Mount Athos. He also visited the Holy Lands and Venice, where he interacted with the local

Orthodox community. He was known for his ascetic way of life. He devoted his life to teaching and delivered lectures in several Greek regions. His audience was clerics and laics. He died in Zante, in the monastery of Kremnon.

Innovative and Original Aspects

Roussanos applied the Christian doctrines on every field of knowledge. Furthermore, he studied Greek philosophy and accepted certain theories, such as the Platonic psychology. He opposed the heretics; among them he included the Catholics and the Protestants. Roussanos was the most zealous defender of the Orthodox dogma following the works of Marc Eugenikos and Gennadios Scholarios. Most of his works are written in the form of epistles or dialogues. Although he blamed the Protestants, he thought of the Holy Bible as superior to the Patristic texts and refrained from mentioning the Holy Fathers in his texts. In addition he heavily criticized ancient Greek philosophy, especially the insistence of certain philosophers about the eternity of the world and the role of fate. Roussanos opposed them and defended free will. He promoted education, since he believed that the study of the Holy Scriptures, the Holy Fathers, and the Greek language contributes to the development of human nature. His sudden death prevented him from publishing his main contribution, a book of grammar, in which he would have expounded the views of ancient grammarians.

Impact and Legacy

Although Roussanos' texts and lectures were not so innovative, church authorities and his fellow monks expressed opposition and pressured him to render faithfully the spirit of the Holy Scriptures. He also felt disguise for the way the monks lived. Indicative of his restricted popularity is the fate of his work against Cartanos, a heretic Greek monk of the sixteenth century, which was reproduced in a few manuscripts, while Cartanos' texts were very popular. His efforts were crucial for the revival of education in sixteenth-century Greece.

Rovida, Cesare

Born: ca. 1549, Milan

Died: ca. 1592

Silvia Fazzo
Milan, Italy

Abstract

Cesare Rovida was born in Milan from a noble family in 1549 ca. His life and work is representative of a still comparatively neglected phenomenon in the 16th c. intellectual history of Milan, of the close University of Pavia and of Northern Italy. It seems that Rovida and his fellow scholars gathered into seminar, reading

and commenting upon ancient Greek texts in their original language. Books owned by Rovida and by his teacher Ottaviano Ferrari, fully annotated as they are with marginalia in Greek and in Latin, shed light into the distinctive way of working of this circle of scholars. Most attention was paid to the ancient Greek commentators on Aristotle's corpus, which they commented upon in their turn, either in Latin or in Greek, focusing on textual criticism and on close exegesis of the Greek text. In Rovida's house, scholars formed the so called "Academia Rovidiana"

Biography

Cesare Rovida (1549ca.–1592ca.) was born in Milan from the noble Galeazzo Rovida. While his brother Alessandro Rovida was a member of the Milan Senate, Cesare studied classics, philosophy, and medicine and travelled through Italy listening to lectures by the best philosophy teachers. Once he graduated, Rovida entered the Collegium of medical doctors in Milan and was appointed at the *Studium Papiense*, (the former name of the University of Pavia), where he was soon promoted to the first Chair of Medicine. In his house in Pavia, Rovida gathered a circle of scholars which is called *Academia Rovidiana* in one at least of the contemporary manuscripts (Bibl. Ambrosiana, Milan, A 116 Inf., a. 1581–1600): "He collected an academy in the style of the ancient Peripatos for the sake of the youth's education. In Pavia, he opened his door to meetings of learned people thus establishing a celebrated academy for the sake of the young minds' instruction" (*"Peripatetico more Nobilem Academiam ad adolescentes exercitandos erexit. ... Eruditorum coetum, insignemque academiam ad excolendum adolescentium ingenium propriis in aedibus Ticini instituit, eaque annis MDLXXX et sequentibus florebat adeo ut Athenae rediisse viderentur,"* Gianbattista Silvatico *ap.* Corte 1718, s.v.). His teacher Ottaviano Ferrari filled the margins of the 1536 printed exemplar of Alexander of Aphrodisias Quaestiones held in the Biblioteca Nazionale Braidense (B XVI 6.078) with notes in Latin and Greek (Fazzo 1999) ; he

owned among many the manuscript M of Aristotle's *Metaphysics* now held by the Ambrosiana Library (F 113 Sup.). It was probably Ottaviano Ferrari, who initiated Rovida to a distinctive method of textual criticism, which they both practiced in the margins of contemporary, i.e., early printing of philosophical texts. Many of Ferrari's books came in the library of Rovida and were finally left with Rovida's books to the Ambrosiana Library, founded in 1607 by Federico Borromeo. A most interesting group of Rovida's books is made of exemplars of early printed editions (*editiones principes*) of Greek texts from the Aristotelian tradition. These copies are heavily annotated in Latin and in Greek. The way such annotations were made is a special feature of Ferrari, Rovida, and other scholars in their circle (e.g., Gian Vincenzo Pinelli, a great collector of books). Their method, in Fazzo's view (1999), is identified as a distinctive way of working of sixteenth century Aristotelian Scholars. A partly similar method was practised elsewhere in Italy, especially by ► [Pietro Vettori](#), whose annotated printed editions are now held by the Bayerische Staatsbibliothek in Munich and have been taken into account by the Berlin edition of *Commentaria in Aristotelem Graeca*. The method practiced in Milan shapes a somehow original *Lombardian Aristotelianism*. Rovida's method is thus described by his contemporaries and fellows: "The prime scope was editing Aristotle's works, putting into parallel Greek and Latin sources and revising new exemplars of Greek texts by collation with ancient ones" ("*Primum omnium verba Aristotelis constabilire, Graeca cum Latinis conferre, adhibitis veteribus libris novos emendare*"). Further information we owe to the work of one of his contemporaries (Francesco Ciceri's *oratio funebris* in honor of Capra): "Multa legebat quotidie; multa item quotidie observabat. . . . numquam [Capra] audire [Rovida] intermisit cum intra privatos parietes disputantem . . . tum publice physica Aristotelis explicantem." Special focus thus was on printed editions (*libri novi*), usually *editio princeps* of texts from the Aristotelian tradition, whose defective readings they revised with the help of ancient manuscripts and *ope ingenii*. Since some of Rovida's and of

Ferrari's exemplars were probably collated with Greek manuscripts, some of which could be nowadays lost, it would be interesting to know whether or not such notes could be now taken into account as indirect traditions of the relevant Greek text. The whole phenomenon testifies to the relevance of Ancient Greek learning in sixteenth century Milan, as shown by the relevant "*Ruoli delle scuole pubbliche*," where one can see that Greek classes were regularly provided in the so called Broletto, nearby Milan's Cathedral, since the time of Ludovico il Moro (late 15th c.). Rovida's method can be also contrasted with the kind of Aristotelianism Girolamo Cardano could react against in the former decades of the sixteenth century, see, e.g., ► [Branda Porro](#) as a well-known exponent.

Because of his early death, which was probably caused by excessive strain, he could not send any of his works to print. Rovida left a collection of manuscripts and printed books of ancient works, many of which are fully annotated in Latin and in Greek; Rovida also left manuscripts of his own, including a commentary on parts of Aristotle's *Physics* (I-III) which Rovida wrote himself in Greek (ms. Ambr. S 89 inf., 4–51, see Fazzo 1999 75). A description of manuscripts from his collection, which are now held by the Biblioteca Ambrosiana and whose content can be viewed online at the website <http://manus.iccu.sbn.it>.

Rubio, Antonio

Born: 1548 (La Roda)

Died: 8 March 1615 (Alcalá)

Victor M. Salas

Sacred Heart Major Seminary, Detroit, MI, USA

Abstract

Antonio Rubio, S.J., was a Jesuit philosopher who lived during Spain's second scholasticism (1548–1615). A native of La Roda, Rubio, while still only a novice, was sent to the New World together with a number of other Jesuit missionaries. After his final religious profession and ordination to the priesthood, Rubio remained in Mexico where he taught both philosophy and theology. His *Logica Mexicana* bears the name of his adopted homeland and became a quick success among various Jesuit colleges where it was adopted as an official text. Eventually Rubio returned to Spain to assume administrative responsibilities within the Society of Jesus. He died in Alcalá in 1615.

Biography

Antonio Rubio (Ruvius), S.J. (1548 in La Roda) – 8 March 1615 in Alcalá), lived during the Golden Era of Baroque Scholasticism that flourished throughout the Iberian Peninsula and its provinces in the sixteenth and seventeenth centuries. His early studies began at the University of

Alcalá, where, upon the third year of his philosophical studies, he eventually entered the Society of Jesus on 18 April 1569, aged 21 years (de Gylvés 1945, 5; Romero 1988, 10). His education was centered upon the Thomism of the Baroque period, as was to be expected given Ignatius of Loyola's determination that in theology Thomas Aquinas would be normative just as in philosophy Aristotle would be followed. At this point, the influence of Francisco Suárez (1548–1617), Rubio's contemporary, was not yet established among Jesuit scholastics, and so scholasticism's *Doctor Eximius* exercised little influence over Rubio (de Gylvés 1945, 8).

After having finished his novitiate, Rubio took his simple vows on 1 May 1571. In 1574, while still studying for the priesthood, Rubio's superiors sent him to Mexico to hold a chair in philosophy (Laurenti 1997, 201). Rubio, along with two other Jesuits, Pedro de Hortigosa and Pedro de Morales, arrived in Mexico sometime in September of 1576 (Romero 1988, 11), and there Rubio's career and religious life would unfold. Rubio made his religious profession in 1587 (de Gylvés 1945, 5) and remained in Mexico and served as a professor for many years, first teaching philosophy and then theology. One of his most famous and successful works bears the name of his adopted home: the *Logica Mexicana*. A short commentary on Aristotle's logic, the *Logica Mexicana* found quick favor at the University of Alcalá and was adopted in 1610 as an official text (de Gylvés 1945, 6). Given that Rubio, together with Francisco de Toledo and the Conimbricenses, is one of the few Jesuits René Descartes mentions having studied at La Flèche, it seems likely that Rubio's text enjoyed a good reputation beyond Spain.

The *Logica Mexicana* features a distinct treatise on analogy, the *Tractatus de Nominum Analogia*. Not surprisingly, this text considers Cajetan's own famous work of the same name, but Rubio's teaching on the subject differs in fundamental ways from that of Cajetan. Rubio, for instance, rejects Cajetan's claim that all analogies of attribution are extrinsic and that proper proportionality alone pertains to intrinsic perfections (Ashworth 1999, 52–53). Whereas

Cajetan's preoccupation was with the semantic conditions for the possibility of analogy, Rubio is much more concerned with identifying the relationship between semantics and ontology (Ashworth 1999, 53). Against Cajetan, but in agreement with Suárez, Rubio accords primacy to an analogy of attribution over that of proper proportionality. But, standing against Suárez and allying himself more closely to the Thomist position, Rubio rejects the claim that the concept of being enjoys an absolute simplicity. Instead, Rubio argues that the concept of being is distinct as it applies to God and as it applied to creatures (Ashworth 1999, 58).

In his philosophical anthropology, Rubio was largely content to follow the Aristotelian position as interpreted by Thomas Aquinas. Nevertheless, he did depart from Thomas in certain areas. For example, in addressing the question whether or not the vegetative soul is "formally" included in both the sensitive and rational souls, Rubio holds an opinion attributed to the "*Recentiores*" in opposition to Thomas, who had himself held that the rational soul "virtually" contains sensitive and vegetative souls (*Summa theologiae* I, q. 76, a. 3). Rubio argues that the rational soul "formally" contains both the sensitive and vegetative souls, which is to say that while man is sensitive and alive essentially, he is not so characterized specifically. Yet, man cannot be sentient and alive without the actualization and determination of some form, which is the rational soul, the only form man possesses. But since the form operates within the order of formal causality, man's sentience and vegetative powers are the *formal* effects of the rational soul which acts within the order of formal causality (de Gylvés 1945, 15–16).

In 1599 Rubio returned to Spain to publish his works and assume administrative responsibilities within the Society of Jesus. He remained active for another 15 years or so, teaching both philosophy and theology at the University Complutense of Madrid as well as composing various works on Aristotelian philosophy. Rubio eventually died at Alcalá on 8 March 1615 (Laurenti 1997, 201–202).

Rusch de Balingen

► Reisch, Gregor

Russiliano, Tiberius

Born: 1490, Circa, Gimigliano (Italy)

Died: 1560, Circa, Perhaps in Africa

Laura Carotti

Scuola Normale Superiore, Pisa, Italy

INSR, Florence, Italy

Abstract

Tiberius Russiliano was a philosopher of the Italian Renaissance. A restless spirit with a profound knowledge of Aristotle and his commentators, he sought to establish himself in the academic sphere but, due to his subversive and even heretical theories, was forced to flee to Sicily. His extant works are *Apologeticus adversus cucullatos* (1519 or 1520) and *Universalia porphyriana* (1526).

Biography

Russiliano was born around 1490 in Gimigliano, near Catanzaro in Southern Italy. After completing his early studies in his home town, in 1515 he went to Naples, where he came into contact with the Pontanian milieu, and to Salerno, where he attended the lessons of the Aristotelian Agostino Nifo. Eager to establish himself in the academic world, in 1518 he went to Bologna to hold a quodlibetic debate. However, the 400 publicly posted theses he intended to debate aroused turmoil and outrage, and Russiliano only managed to avoid excommunication thanks to the intervention of Scotist Gerolamo Gadius. Forced to leave Bologna, Russiliano reached Florence, where once again his debate sparked an uproar and he was forced to recant before the Franciscan inquisitor Paolo da Fucecchio.

As evidenced by the work *Iesus vincit* by the Dominican Girolamo Armellini, printed in 1523, in which Russiliano's arguments are analyzed and refuted, the Calabrian philosopher's fame as a

heretic began to spread (Armellini 1525). Despite this, in Padua he was finally able to discuss his theses, adding to the previous 400 various others on the issue of the reconciliation of Platonic and Aristotelian thought. The content of the dispute was then put in writing and printed secretly in Parma at the end of 1519 or early 1520, with the title *Apologeticus adversus cucullatos* (Russiliano 1991; Russiliano 1994).

Escaping again to Tuscany, on September 17th, 1520, Russiliano held a lecture at the University of Pisa, as a substitute pending the arrival of Nifo. Relapsed and unrepentant, he was once again arrested and imprisoned in Florence but managed to escape to Sicily. Thanks to the limited control of the territory by political and religious authorities, he was able to become a professor of dialectics and, in November of 1526, published in Palermo an annotated translation of Porphyry's *Isagoge*, the *Universalia porphyriana*.

According to the testimony of contemporary Gabriele Barri (1737), Russiliano was murdered by his servant during a trip to Africa, around 1560.

The *Apologeticus adversus cucullatos* – opening with a *Prefatio* that retraces events in the life of the author and concluding with a *Peroratio* – consists in the discussion of 13 statements and is a veritable compendium of the author's ability to rework past philosophical tradition in a subversive way, presenting heretical positions as legitimate and even in harmony with the faith, with self-assured argumentative skill. Russiliano supported the validity of theories such as spontaneous generation, the eternity of the world, and the influence of the stars on all bodies, even on Christ, whose body was subject to the influence of the stars like all other men. But the Calabrian philosopher, fierce critic of the immorality of monks, went further and argued that there is no real presence of Christ in the Eucharist; that there is no eternal punishment – even in the face of mortal sin, reflecting Origen's great influence on him – that God is not one and triune; and, based on Averroes, that in life one can attain an intellectual intuition of the divine.

In the light of these statements, it is no wonder that *Apologeticus* was brought to the attention of the intellectual community by free-thinker Gabriel Naudé, who considered Russiliano to be one of the most innovative writers of his time.

The other work by Russiliano that has come down to us, *Universalia porphyriana*, is also configured as a continuous dialogue with tradition. In this careful exegesis of Porphyry's text, in which the author also revives various theses from the *Apologeticus* such as spontaneous generation, logical discussion (influenced by the approach of Lefèvre d'Étaples) is soundly based on metaphysics, and thus the *universalia* are at once real entities according to Being and entities of reason according to intelligence.

From *Apologeticus* to *Universalia porphyriana*, Russiliano conducts a close comparison with his predecessors, proving himself to be a subversive thinker, an Aristotelian 'eclectic'.

Abstract

Bartolomeo Sacchi, better known as Platina, was an Italian humanist who lived an eventful life. Starting out as a mercenary soldier, he moved to the court of Mantua, spent some years in Florence, before transferring to Rome where he was arrested twice by Pope Paul II, and finally became prefect of the Vatican librarian.

Before 1475 he wrote many works, including a very popular cookbook. His compendium of the lives of the popes broke with medieval historical writing on the papacy. He developed original ideas and innovative arguments in his dialogues exploring the themes of love and nobility, as well as in his political works where he analyzed the virtues required by a perfect prince and an ideal citizen. His writings made him a leading figure of the Renaissance.

Biography

Bartolomeo Sacchi was born in 1421 in Piadena, a small town near Cremona from whose Latin name he derived the pseudonym Platina. Between 1445 and 1449, he served as a mercenary soldier under the condottieri Francesco Sforza and Niccolò Piccinino but gave up his military career to acquire proficiency in *studia humanitatis* under Ognibene da Lonigo, who had replaced Vittorino da Feltre (1378–1446) as teacher of the humanistic school of Mantua.

In 1453 Platina himself succeeded Ognibene da Lonigo and in this capacity served as the tutor to Francesco and Federico Gonzaga, the sons of the marquis of Mantua, Ludovico Gonzaga, who had been his patron for many years. Platina's first work, *Divi Ludovici Marchionis Mantuae Somnium*, was written between 1454 and 1456 to celebrate his patron's interest in the works of Virgil and in humanistic culture.

In 1457 Platina obtained authorization to travel to Greece to study Greek, but upon hearing that the Byzantine scholar John Argyropoulos had accepted a post teaching the ancient language (and moral philosophy) at the *Studium Florentinum*, he chose instead to study under him. During his stay in Florence, between 1457 and 1462, he enjoyed the patronage of the Medici family and spent time with Marsilio Ficino and

other eminent Florentine humanists. However, he neither taught Greek to Ficino (Kristeller 1956) nor became a member of the so-called Platonic academy, a group of humanists fascinated by the philosophy of Plato who gathered around Ficino after 1462 (Field 2002, pp. 365–372), as has sometimes been claimed. In addition to an oration in praise of Ludovico Gonzaga, in Florence Platina wrote the *Vita Nerii Capponi* (1457–c.1460) and a Latin translation of Capponi's *Commentari*, two works that confirm his closeness to the Medici.

Platina moved to Rome to follow Federico Gonzaga, who had been made cardinal, but his hopes of becoming Gonzaga's secretary came to nothing. Instead, in 1464 he became a member of the College of Abbreviators, a body of writers whose task was to draft bulls and briefs for Pope Pius II. When Pope Paul II decided to dissolve the college, Platina opposed his decision in such a manner that the pontiff had him imprisoned in the Castel Sant'Angelo for 4 months (1454–1455).

In 1468 Platina, together with other members of the so-called Roman academy – a fraternity of humanists gathered around Pomponius Laetus (Hankins 2011, pp. 31–46) – was again imprisoned by the pope who felt sure that their interest in Roman antiquity had deteriorated into heretical belief and in a republican conspiracy against his life. Although the actual existence of that conspiracy has neither been proved nor disproved by scholars (Dunston 1973; Medioli Masotti 1982), and although Platina was acquitted of heresy (Mitarotondo 2005), he remained in prison until 1469.

His rehabilitation came only in 1475, when Pope Sixtus IV appointed him Prefect of the Vatican library. His appointment was depicted by Melozzo da Forlì in a famous fresco in the Vatican museums.

The majority of Platina's works were written in Rome between 1464 and 1475. Prior to his first imprisonment, he wrote a biography of Vittorino da Feltre (after 1461) and two works by which he sought to curry favor with the pope and obtain a position in the Curia: a eulogy of the liberal arts

dedicated to Pope Pius II (*De laudibus bonarum artium*, c.1463) and a biography of Pius II (1464), which became the nucleus of his compendium of the lives of the pontiffs.

After his first arrest, Platina started *De falso et vero bono*, the consolatory dialogue dedicated to Pope Sixtus IV in 1472, and the *Historia Mantuana*, a historical work in which he celebrated his first patron, Ludovico Gonzaga, as the ruler of a new golden age. Shortly after his release, he began work on *De amore*, a consolatory dialogue on love that was given the title, in 1471, of *Contra amores*. While the date of Platina's epitome of Pliny's *Natural History* is still uncertain, there is no doubt that *De flosculis quibusdam linguae Latinae*, a compendium in the form of a dialogue on Lorenzo Valla's *De linguae Latinae elegantia* (1434–1435), was written between 1465 and 1466. In the same period, Platina completed *De honesta voluptate and valetudine*, a very successful cookbook unparalleled in the fifteenth century.

During his second imprisonment, Platina turned his attention to a very different subject: war. In the oration *De pace Italiae*, he praised the role of Pope Paul II in the pacification of Italy and in defending Europe against the Turks. But in the dialogue *De laudibus pacis*, he rejected the commendation of war made by his interlocutor, the prefect of the Castel Sant'Angelo.

On his second release from prison, Platina sought the patronage of Cardinal Bessarion, to whom he addressed a panegyric in 1470. In 1471 he completed *De principe*, a humanistic portrayal of the perfect prince dedicated to Francesco Gonzaga, a son of his first patron who had assumed the government of Mantua. In the same year, Platina started the *De optimo cive*, a humanistic depiction of the perfect citizen, which he presented to Lorenzo de Medici in 1474. Also in that year, he offered to Sixtus IV the *De vita Christi ac omnium pontificum*, a compendium spanning papal history from Saint Peter to his own day. In 1475 he wrote his final work, the dialogue *De vera nobilitate*, by which he took part in the humanistic debate on nobility.

Platina devoted the final years of his life to the reorganization of the Vatican library. He died in Rome in 1481, having contracted the plague.

Heritage and Break with Tradition

The works through which Platina made a key contribution to Renaissance thought were written in Rome between 1464 and 1475.

Platina's main historical work was of course the *De vita Christi ac omnium pontificum*, a collection of the lives of the popes that marked a turning point in medieval historical writing on the papacy. Unlike Jacopo Zeno, who made the first attempt to recast the medieval *Liber pontificalis* in the light of the humanistic idea of historical works, Platina not only described the lives of the popes in elegant and straightforward Latin but also displayed an interest in political history. His biographies were thus enhanced by frequent references to wars, negotiations, and effective government. In addition, he strove "to blur the lines between pagan and Christian antiquity" by depicting the popes as successors and heirs to the Roman emperors (D'Elia 2008, p. ix). In the course of his analysis, he drew from modern sources, including Flavio Biondo's *Decades of History from the Deterioration of the Roman Empire* (c.1453), and combined a variety of ancient sources, without, however, giving a critical evaluation of them. In spite of this limitation, his work enjoyed extraordinary success. After the *editio princeps* was published in Venice in 1479, the *Vita Christi ac omnium pontificum* was reprinted dozens of times, was translated into several languages and was revised and updated in both Catholic and Protestant countries (Bauer 2006). Its popularity was partly due to the fact that Platina had measured modern churchmen against the standard of Christian antiquity and humanistic ideals.

Platina's *Contra amores* held a prominent position among Renaissance works on the theme of love. Conceived as a consolatory dialogue to relieve a lovesick friend, it contrasted erotic love (*amor inhonestum*) with an open form of love in

which sensual pleasure was subordinated to virtue (*amor honestum*). Like other humanists, such as Leon Battista Alberti (*Deifira*, before 1428), Pietro Edo (*Anterotica*, 1492), and Battista Fregoso (*Anteros*, 1496), Platina considered the negative effects of love and recalled Platonic arguments (drawn especially from Plato's *Symposium*) to define it as a form of sickness that interfered with the exercise of reason. At variance with this view, Marsilio Ficino intertwined Platonic and Neoplatonic arguments to describe love as the means through which the human soul rejoined God. Mario Equicola, a supporter of Ficino's philosophy of love, summarized Platina's *Contra amores* in his popular *Libro de natura de amore* (1494–1496), and Thomas Sebillet included it in his *Contramours* (1581).

Platina's *De falso et vero bono* had nothing to do with Valla's *De vero falsoque bono* (1441). Whereas Valla had argued that pleasure was the goal of human life and tried to conciliate Epicureanism with Stoicism and Christian morality, Platina claimed that fortitude should help man to bear any hardship. What is of particular interest is that, when writing *De falso et vero bono*, Platina drew extensively to form the main Stoic sources for consolatory works used during the Renaissance: Cicero's *Tusculan Disputations* and *On the Ends of Good and Evil* and Seneca's *Moral Letters*.

In *De vera nobilitate*, Platina contended that nobility did not spring from lineage or wealth but from virtue alone. As noted by several scholars (Tateo 1974, pp. 355–421; Skinner 1978, pp. 117–130; Rabil 1991, pp. 262–275), Platina played a key role in the fifteenth-century disputation on nobility, echoing the ideas that Poggio Bracciolini's *De nobilitate* (1440) had advanced 35 years earlier. Like *De nobilitate*, Platina's *De vera nobilitate* was widely circulated in both manuscript form and printed editions and thus contributed to popularizing the humanistic view that true nobility hinged on virtue.

Platina's *De principe* belonged to the wide and heterogeneous genre of the mirror for princes written during the fifteenth century. It focused on the moral virtues required for a perfect ruler rather than on the constitutional aspects of princely

government (Skinner 2002, pp. 132–135). Platina's *De principe* resembled the structure of Giles of Rome's *De regimine principum*, the most popular medieval mirror of princes produced during the Renaissance, and therefore consisted of three books, each dealing with the prerequisite qualities for self-governance, government, and military matters. Nevertheless, the books were quite different in content: while Giles of Rome based his analysis on Aristotelian arguments and biblical sources, Platina defined the virtues of the prince by entwining quotations drawn from Aristotle's *Ethics* and *Politics* and from Cicero's works (in particular, *On Duties*, *On the Ends of Good and Evil*, and *Tusculan Disputations*). He then used a long stream of historical evidence from a variety of classical sources to illustrate how they should be applied. In the course of his analysis, Platina also made reference to Plato's *Republic* and described the prince who was loved by all his subjects for his good qualities as a philosopher-king. Since the beginning of the fifteenth century, many humanists had used Plato's image of the philosopher-king to argue that power was justified when combined with moral knowledge based on humanistic education (Vasoli 1980, pp. 151–187). But Platina went further, asserting that power and knowledge were indissolubly linked.

As recently noted (Ceron 2011), one of the most intriguing sections of Platina's *De principe* deals with the issue of friendship. Like Giovanni Tinto Vicini (*De institutione regiminis dignitatum*, before 1406), Pontano (*De principe*, c.1465), and Francesco Patrizi of Siena (*De regno et regis institutione*, 1481–1484), he made use of the Aristotelian and Ciceronian ideal, according to which true friendship was based on virtue, in order to advise the prince to choose honest and trustworthy friends on whom he could rely to manage and administer his power. In other words, he employed the language of friendship to solve the problem of selecting the governing elite. Unlike the aforementioned humanists, Platina stated that the friends of the prince should be chosen from among the noblest of his subjects, since nobility was based only on virtue. Moreover, by insisting that virtue consisted of

intellectual excellence as well as moral greatness, *De principe* emphasized that the governing elite was also an intellectual elite, a point made less clearly in *De vera nobilitate*.

As demonstrated by Nicolai Rubinstein, *De optimo cive* was an abridged version of *De principe* (Rubinstein 1985, pp. 375–388). With just a few changes, Platina turned his treatise on the perfect prince into a dialogue in which the old Cosimo de' Medici explained to his grandchild Lorenzo how to become an ideal citizen. Platina substituted the first chapter, extolling the virtues of monarchy for a preface, which celebrated active participation in public life. He then added a section on patriotism, removed the chapter on the unhappiness of the prince, modified some historical references, and omitted the book on military matters. In the remaining parts of the work, he simply replaced *optimus princeps* with *optimus vir*.

Since Platina's catalog of virtues remained unchanged, *De optimo cive* displayed more clearly than other works of the humanist belief that citizens needed to possess the same qualities as princes to become perfect rulers; it thereby suggested that the humanism of the court should not be opposed to civic humanism. Yet, given that the dialogue between the *pater patriae* and Lorenzo de' Medici was made up of a long analysis of civic virtues, Platina's *De optimo cive* has often been compared to Matteo Palmieri's *Della vita civile* (c.1430–1438), with which it was published in a joint edition in the middle of the twentieth century (Platina 1942). As observed by Hans Baron, Platina revised Palmieri's ideal of active participation in public life and placed it within a cultural context where the life of contemplation had superseded civic life in terms of popularity owing to the so-called "return of Plato" (Baron 1966, pp. 564–566). Moreover, whereas Palmieri's work made no reference to the Medicean rise to power, in the section on patriotism in *De optimo cive*, Platina portrayed the Medici as the guardians of the freedom of Florence, seeking to conciliate their power with the republican tradition of the city. As recently remarked (Hankins 2010), one of the most interesting aspects of his work on the perfect citizen

was its description of the Republic of Florence as a popular republic (*popularis respublica*), which was not so much threatened by external enemies or internal factions as by the political ambition of unworthy and imperfect citizens.

Innovative and Original Aspects

While it is clear that Platina developed innovative theses in many of his writings, there can be no doubt that the most original of his works was *De honesta voluptate et valetudine*. Far more than a mere cookbook, this was a real literary work that had gastronomic pleasure as its main theme (Larioux 2006). Moving from medical considerations based on Galen's theory of the humors and the medieval dietetic tradition, Platina provided a long list of recipes that allowed dining companions to combine enjoyment with good health.

The contents were modern for, of his own admission, Platina derived most of his recipes from the *Libro de arte coquinaria* (1450–1467) by Martino of Como, a culinary expert and chef at the Roman palazzo of the papal chamberlain. However, the structure of *De honesta voluptate et valetudine* was ancient for Platina modeled his cookbook on that of Apicius. In the course of his study, he also drew on Pliny's *Natural History* and a variety of lesser-known classical sources, creating a new Latin vocabulary of food (Milham 1998).

It should also be noted that Platina attached to his recipes many anecdotes on the eating habits and tastes of his fellow members of the Roman academy for two reasons. On the one hand, the anecdotes gave prominence to the (Stoic) precept of self-restraint when dining. On the other hand, they illustrated how after-dinner talk could enhance the pleasure of a meal, in line with the Greek and Roman tradition of symposia and the Renaissance ideal of civil conversation.

Impact and Legacy

Like *De vita Christum ac omnium pontificum* and *De vera nobilitate*, *De honesta voluptate et valetudine* was a highly successful work, being

reprinted many times between the end of the fifteenth and the beginning of the sixteenth century (Rome 1475 and 1517; Venice 1484, 1487, 1498, 1508, 1516, and 1517; Cologne 1529 and 1537; Paris 1530).

Platina's other works considered here were less successful, though equally far reaching. *Contra amores* gave a decisive contribution to the Renaissance philosophy of love, and *De principe* and *De optimo cive* developed an intriguing reflection on the perfect prince and the perfect citizen, thereby shedding new light on the nature and relationship of the humanism of the court and civic humanism. For these reasons, Platina has been considered one of the leading figures of the Italian Renaissance.

Salutati, Coluccio

Born: Stignano, Italy, 1331

Died: Florence, Italy, 1406

Rebecca Becky Green

Independent Scholar, Eagle, Colorado, USA

Abstract

Coluccio Salutati is not your typical intellectual figure. He certainly played his part as a scholar by promoting the humanistic movement: not only carrying on the tradition once Petrarch and Boccaccio passed away, but also making sure the next generation of students was well-prepared to continue it during the next century. In addition to his scholastic endeavors, he served as Chancellor of Florence from 1375 until his death in 1406. A few scholars have held such a high-profile position within their nation's government, but Salutati's frequent correspondence with figures both far and near allowed him to place Humanism on an international stage.

Modern scholars familiar with Salutati's work often notice the varied and often inconsistent ideas it contains. Both deeply religious and highly interested in classical studies, Salutati's work demonstrates medieval as well as humanistic characteristics. While this has perplexed some scholars, others point out how such inconsistencies seem reasonable given Salutati's background, as we will see below.

Biography

Coluccio Salutati, born in the small Tuscan town of Stignano in 1331, would become an essential

promoter of Humanism not only within Italy but throughout Europe as well. He would eventually follow in his father's footsteps and become a notary – a profession that would allow him to climb toward the upper circles of Florentine society in the late fourteenth century while keeping up with his studies in Humanism and his frequent correspondence with other humanists.

Salutati's father, Piero Salutati, worked for Taddeo de' Pepoli in Bologna, where most of Salutati's education would consequently take place. Taddeo de' Pepoli ruled Bologna and provided a fair salary and political refuge for Salutati's father, who was exiled from Stignano in 1330 as a result of his Guelf affiliations (Witt 1983, pp. 3–5). Even though his father died in 1341, the family enjoyed the protection and patronage of the Pepoli until the day they were removed from power in 1350.

Fortunately for Coluccio, this situation allowed him to attend school in one of the most sophisticated and advanced educational atmospheres in Europe at the time. Bologna, being the premier spot for anyone seeking a legal education in the fourteenth century, was, therefore, a perfect spot to study as a notary. His earlier education was not without importance, however. In grammar school, he studied under Pietro da Moglio, who was known as a follower of this new strain of Humanism, which had started in Padua in the mid-thirteenth century. Here, he learned the essentials of rhetoric and was introduced to some of the fundamental classical authors (for more detailed information about Salutati's schooling as well as Pietro da Moglio, see the first chapter of Witt 1983). Pietro da Moglio must have had some sort of influence over Coluccio given that the two corresponded later on in Coluccio's life (Witt 1983, p. 19).

After completing his notarial training, and given that his family's connections in Bologna were no longer in power, Coluccio moved back to the Valdinievole area (in which Stignano is found) with his family. He, therefore, started practicing as a notary in the small towns nearby, including Buggiano, Uzzano, Pescia, and Santa Maria a Monte, sometimes working in an official capacity for these small communes and sometimes working in his own private practice. Later

on, in 1367, he moved out of the Valdinievole area and became an official notary for the city of Todi, which was a more important position and a significant step-up for the, as of yet, small-town notary. During his time in Todi, he would spend time corresponding with his friend, Francesco Bruni, who worked in the Papal Curia, and asking for assistance in obtaining a position there. While responses from Bruni were few and far between, Salutati left Todi in the spring of 1368 and went to Rome, where he was eventually employed by the Curia. This was not only a more high-profile position for the ambitious notary, but also an environment that would influence Salutati's intellectual work of the future, as Witt explains:

...there was a noticeable change in Salutati's correspondence in the course of 1369, [...] and afterward, a new tone: the sharp conflict between virtue and fortune became blunted by the active presence of a third force, the Christian God. Man was no longer alone in his struggle with fortune as he had seemed to be in Salutati's earlier ethical pronouncements. (Witt 1983, pp. 86–88. Quotation from p. 88)

After his time in Rome, Salutati received another position in Lucca, working as an official notary with the city, which was yet another professional step up. Finally, in 1374, he would begin working with Florence in the office of the *Tratte*, which oversaw Florentine elections. (For more detailed information about the politics involved in each of Salutati's positions and the events leading up to them, see chapter four of Witt 1983.) Eventually, this position would lead to his election as chancellor, a position he would enjoy for the rest of his life.

Once elected as chancellor of Florence, he was in a high-profile position with international contacts, thereby providing a nearly worldwide stage for his humanistic interests and studies to play out. Given the increase in salary, he was able to build up a personal library with numerous manuscripts and writings, many of which are still heavily referenced by scholars today. Witt also describes Salutati's efforts to obtain copies of Petrarch's manuscripts upon his death (Witt 1983, chapter 7). This position in Florence was, therefore, a perfect place for Salutati to actively participate in society while promoting his interests as a humanist with his numerous correspondents.

Heritage and Rupture with Tradition

This combination of active interests and scholarly pursuits is perhaps one of the most fascinating aspects of Salutati's legacy. In fact, Salutati used his position to put humanism into practice, specifically with the numerous letters he wrote on the city's behalf, as we will see below. Scholars often note the efficacy of his diplomatic letters and their success not only in persuasion but in their mastery of sophisticated rhetoric (Witt 1976, 2000; Ullman 1963).

Another interesting aspect of Salutati's character is the fact that his thought and intellectual activity display aspects of both medieval and humanistic thinking at the same time. Salutati vigorously defended the value of reading classical authors in the midst of a culture that heavily questioned the purpose of reading any text not centered on Biblical teachings. Medieval texts often focused on reinforcing asceticism – namely that secular pursuits were secondary to Christian pursuits: better to withdraw from society and lead a life of contemplation separated from the corruption of the world than to be overly involved in worldly activities. From a medieval perspective, someone reading classical authors such as Seneca, Cicero, or Virgil would be spending their time on worthless pursuits – pursuits that could even pose a danger to their faith. Someone like Salutati, who was known for studying these authors, and simultaneously held such a high-profile position, would bring a level of patronage to such studies that were rarely seen during that time.

At the same time, Coluccio himself was known for his strong faith. His letters were often deeply pious in nature, especially after 1369, as we saw above. Some of his works, as we will see below, even reflect medieval tendencies such as his *De seculo et religione*, in which he praises the *vita contemplativa* over the *vita attiva* for his friend requesting encouragement as he prepares to take monastic vows. Ullman addresses the irony of such a text being composed by none other than the Chancellor of Florence (Ullman 1963). According to Ullman, scholars who regard such a text as a complete reflection of Coluccio's personal thought have over-interpreted;

Martin goes too far in thinking that Coluccio believed all he said, that he favored monasticism under any circumstances. Coluccio was sincere in urging it upon the monk who asked him to write something that would help him. He accepted the institution of monasticism but did not himself become a monk. If a friend had asked him for reasons for not dedicating himself to a monastic life, he might well have presented in great detail a point of view opposed to that of the *De seculo*. ... (Ullman 1963, p. 27)

(Here, Ullman is disagreeing with Alfred von Martin and agreeing with the assessments of Revilo P. Oliver, T.F. Rich, L. Borghi and E. Garin).

Thus, we see one of the more interesting, yet perplexing, aspects of Salutati's character. As Baldassarri mentions, this back and forth sometimes results in disapproval by some scholars:

Scholars [...] tend to depict Coluccio Salutati as [...] an author on the threshold of a new era that he himself has significantly contributed to usher in while retaining some no-less-significant features of the age about to disappear. [...] Yet a widespread consequence of such an approach [...] is that modern readers [...] are often disappointed by Salutati's work, finding it both inconsistent and below their high expectations. (Baldassarri 2014, p. vii)

Innovative and Original Aspects

In examining the legacy of Salutati's innovations and originality, a first place to start is certainly his letters. He left behind a plethora of letters, both public and private, some of which were collected and held by his friends on account of their elegance and sophistication. These letters were a platform for Salutati to examine some highly debated subjects of the time, such as friendship, fate, faith, and the *vita attiva* versus *vita contemplativa*, as we saw above.

They also became one of the primary means by which Salutati conducted diplomacy and foreign affairs during his tenure as Chancellor of Florence. Such diplomacy was an immediate necessity for Salutati given that the War of the Eight Saints was taking place right as Salutati began his term as Chancellor in 1375 (lasting until 1378). In fact, Salutati's letters were known to be so powerful and persuasive that Giangaleazzo Visconti

purportedly mentioned that “one letter of Salutati’s was worth a troop of horses”(Witt 2000, p. 302 – Here, Witt references the versions of this statement offered by F. Novati in his edition of Coluccio’s letters: *Epistolario di Coluccio Salutati*, ed. F. Novati. 4 vols. FSI, nos. 15–18. Rome, 1891–1911). Witt provides a thorough analysis of these letters, along with their rhetorical characteristics, in some of his scholarship, which will be helpful for our discussion here (Witt 1976, 1983, 2000). It is important to note that a good portion of these letters was meant to be read aloud to the recipient, usually while others listened (Witt 2000, p. 303). Salutati’s ability to manipulate this oral context in conjunction with an appropriate amount of “drama” in the text of his letter was key (Witt 1976, p. 39). As a student of classical authors and classical Latin himself, he was able to imbue these letters with an educated and sophisticated language that few of his peers were able to rival. Witt mentions how some of this talent with rhetoric stems from his education with Pietro da Moglio, one of Salutati’s earliest teachers (Witt 1976, pp. 37–38). Within these letters, Salutati also skillfully used historical anecdotes to support his point and enrich his discussion. During the War of the Eight Saints, Salutati exploited Florence’s Roman past in order to establish Florence’s reputation as a loyal descendant of Rome. Ancient Romans were known for their resistance to tyranny, and Florentines, as an heir to such a legacy, would do the same (Witt 2000, pp. 312–313). Later on, when tensions between Florence and Milan grew (specifically during the Milanese wars between 1390 and 1402), Salutati used Florence’s Roman past to counter accusations from Milan that Florence had planned to kill their leader, Giangaleazzo Visconti (Witt 2000, pp. 313–314). Baldassarri also discusses this in his introduction to some of Salutati’s works, noting how Salutati also references the “myth” of Florence being rebuilt by Charlemagne toward the end of the eighth century; Florence, consequently, would be loyal to its ties with France, given that French assistance was needed in their conflicts with Milan (Baldassarri 2014, pp. xxi–xxii). Witt offers a salient point that such historical references were not only effective as

propaganda, but also allowed listeners the opportunity to visualize themselves within the course of history at large, and not just a singular point in time (Witt 2000, p. 311).

In addition to his letters, Salutati was renowned for his contributions to textual criticism and philology (Ullman provides a great portrait of this in his chapter “Coluccio as a Scholar” in (Ullman 1963)). As mentioned earlier, Salutati was a great collector of manuscripts and religiously sought out copies not only of the classical authors but of his near contemporaries (such as Petrarch’s work after his death in 1374) (Witt 1983, chapter 7). Salutati referred to various renditions of the same work in order to reach the most realistic interpretation of the text he was analyzing (Ullman 1963, p. 101). He often spoke of the importance which scribes had in transmitting a text down through history and often blamed them for the many errors he found within various editions (Ullman 1963, p. 101). Some scribes were guilty on account of their ignorance while others, perhaps less ignorant, were guilty of deliberately altering a text for their own purposes (Ullman 1963, pp. 101–102). Ullman notes that Coluccio’s solution to this problem was establishing a library with trustworthy scholars who could spend their time reviewing the texts and making the necessary corrections (Ullman 1963, pp. 101–102). Cosimo dei Medici, establishing his famous library in San Marco of Florence, came close to realizing this solution (Ullman 1963, p. 102). Ullman discusses one of Salutati’s textual endeavors, namely finding the original name of Città di Castello, in which he consulted twenty manuscripts in order to get to the bottom of the dilemma (according to his findings, the city’s name was either Tyberine or Tyferne) (Ullman 1963, pp. 102–103). Aside from this, Salutati was known as an assiduous and detailed student of the texts he sought out, making corrections and notations where he could in the hopes of ultimately discovering the true text itself. He often had long discussions with his students about orthography and punctuation (Ullman 1963, pp. 108–112). As Ullman states: “Many of his emendations and the variants he took from other manuscripts find a place, unbeknownst to us, in our modern texts. Not only that, but his disciples

learned his methods and passed them on” (Ullman 1963, p. 100). Ullman even goes so far as to note how Salutati’s detailed investigations of texts and history represent an advance in the “scientific method” (Ullman 1963, p. 114).

In accordance with his philological and textual pursuits, Salutati also played a leading role in convincing Manuel Chrysoloras to instruct ancient Greek in Florence between 1396 and 1399. This would ultimately spark a renewed interest in the language throughout Italy, which only furthered the progression toward the Renaissance. And while Coluccio himself never progressed too far in his mastery of the language, he was instrumental in introducing his students, especially Leonardo Bruni, to the language which would become fundamental for their own future studies. Ullman notes the irony of Salutati’s role in furthering the study of Greek, especially given that much of Salutati’s thought seems contradictory to Platonism in general (Ullman 1963, pp. 85–89). As we will see below, Salutati often defended the value of poetry, yet poets are not treated so favorably by Plato in his *Republic* (Ullman 1963, p. 86). In fact, Platonism would become fundamental to humanist thought later in the fifteenth century and one wonders how Salutati might have responded had he known this outcome, as Ullman points out. Alas, this topic remains for debate among scholars.

Impact and Legacy

Salutati’s intellectual influence was both temporal and spatial. In more immediate terms, one pupil who studied directly under Salutati became one of Humanism’s more important scholars, namely Leonardo Bruni. Salutati had other students, including Poggio Bracciolini and Pietro Paolo Vergerio, who would achieve relative fame and later form an important part of the humanistic circle after Salutati’s death. (For more information on those who studied and corresponded with Salutati, see Ullman’s chapter “Coluccio’s Influence” (Ullman 1963)). These students carried on

Salutati’s fervor and methods for examining ancient texts and furthering our understanding of them, thereby continuing the growth and reach of Humanism.

Given his role as Chancellor, Salutati had the opportunity to correspond and interact with international contacts. As mentioned above, he had contacts with various persons in the Papal Curia, both in Avignon and Rome. Armando Nuzzo, in a recent article, also highlights Salutati’s correspondence with Hungary and the Italian statesman Filippo Scolari (Nuzzo 2005). Here, Nuzzo highlights the themes of the multiple letters sent to Hungary from the state of Florence (eighty-five letters known thus far, to be exact), which include discussions of politics and treaties among considerations of commerce and the like (such as the gold and salt markets) (Nuzzo 2005, pp. 347, 351). Salutati did not fail to insert humanistic topics in such letters, however, as Nuzzo shows in his examination of one of the Chancellor’s later letters to Scolari. Here, Salutati discusses the privilege of Scolari’s position, along with God’s providence in his attainment of it, and how the kingdom would benefit from his loyalty to the *Patria* (i.e., the country) – the *Patria* being another important theme for Salutati (Nuzzo 2005, pp. 354–357). Thus, Salutati’s passion for humanism was borderless.

Salutati, in addition to his letters, also left other original works for posterity, as we will now discuss. As previously noted, many of his works have puzzled scholars as a result of their inconsistencies and the variable positions they purport. We will start with the *De tyranno* and move on to some of Salutati’s other works which have perplexed scholars over the years.

Baldassarri provides a fitting introduction to the *De tyranno* in his recent Introduction to some of Salutati’s political works (Baldassarri 2014). The *De tyranno* was written by Salutati in response to inquiries by Antonio of Aquila, then studying in Padua as a law student. The main content of the work centers on the acts of Brutus and Cassius in murdering Caesar in ancient Rome and whether their actions were noble or immoral.

To sum up Salutati's response, given that the Roman monarchy was instrumental in promoting Christianity and preparing the world for the return of Christ, Caesar's success was part of a divine plan. Consequently, the actions of Brutus and Cassius stood against this plan. Salutati also states that this reasoning thereby justifies Dante's placement of these two figures in one of the lower circles of his *Inferno*. This line of reasoning is interesting given Salutati's tendencies of glorifying Florence's Roman heritage in fighting against tyranny and standing up for Republicanism and liberty, which we saw in some of his letters noted above. Baldassarri recognizes this and raises some crucial points, notably that Salutati was, more often than not, constrained to steering his logic wherever the needs of the state required it to go (Baldassarri 2014, pp. xv–xx). Given that the *De tyranno* was written in 1400, when Florence was at odds with Milan, "Understandably, such a move demanded that Salutati carry out a reassessment [...] of the respective merits of monarchy..." (Baldassarri 2014, p. xvi). Additionally, the same work mentions that monarchy is fit for some peoples (when the ruler is just and respectable), while not necessarily fit for others, such as Florence, given that rulers are oftentimes immoral and self-serving (Baldassarri 2014, pp. xvi–xvii). Given these contextual considerations, the apparent inconsistency of Salutati's thought is rather an adaptation to the various political circumstances occurring during the period. In other words, Salutati's works are more of a manipulation of literary and historical exempla in order to construct a lens with which to interpret and analyze political predicaments.

In a similar vein, W. G. Craven provides an explanation of Salutati's views on poetry, specifically looking at Salutati's *De laboribus Herculis* (Craven 1996). To sum up, the *De laboribus Herculis* investigates the reason behind Seneca's representation of Hercules as a God after having killed his wife and children. Salutati argues that allegory is indispensable in interpreting Seneca's treatment; given that Hercules' children represent the likes of lust and other vices, Hercules actions

become more than justifiable. Allegory was one of Salutati's frequent tools in his defense of classical poets, arguing that the act of hiding a noble meaning within a text, which, at first glance, depicts offensive actions or circumstances, was a frequent, yet admirable, habit of many poets. Salutati often pointed to the verse and allegory used within the scriptures as well when defending classical works. If such allegorical tools are used in interpreting the Bible, why should such tools not be applied to extract righteous meanings from the classical poets?

Earlier in our discussion, we noted Salutati's *De seculo et religione*, which praised monastic traditions – not necessarily a subject that one would expect to find from the same author of the *De laboribus Herculis*, where we find a defense of pagan poetry. As such, it is interesting to note some of the debates among scholars regarding such apparent contrasts in thought. As mentioned earlier, Witt mentions a distinct tendency toward more pious thought in Salutati's writings after his time in Rome between 1369 and 1370. Craven, on the other hand, believes that Salutati is merely partaking in the intellectual activity of "disputation," where consistency or cohesion of thought is not nearly as valuable as one's ability to recall as many examples and references as possible (Craven 1996, pp. 5–6). With regard to Salutati's differing positions on poetry, Craven states: "It was within a genre where it mattered more to have a range of arguments than it did to develop a coherent position, [...] Novelty did not rank high on the scale of values; it was more a matter of manipulating material from familiar sources and authorities" (Craven 1996, p. 27).

Another interesting work from the same author defending classical literature is Salutati's *De fato e fortuna*, in which he discusses the roles of fate and fortune, along with free will. In addition, he discusses how these fit into God's plan from a Christian worldview and follows the trail of Augustine's thought. Concetta Bianca provides a thorough introduction to this work, which she has edited, and discusses some of the major themes of the work, namely Salutati's reinforcement of the

importance of Patria and defending one's homeland (Bianca 1985). Here, Salutati argues that pursuing peace is important for the well-being of a city's inhabitants and promotes a healthy society (Bianca 1985, p. xxii). Bianca notes that such themes are not surprising from a person living during a time when wars, plagues, and other travesties were far too common.

In conclusion, while relatively unknown to those outside of academia, Salutati was not only an influential intellectual but an interesting one, to say the least. Far from subscribing personally to the *vita contemplativa*, he led a very public life as Chancellor of Florence. During his time in office, he was able to fully employ his rhetorical training to further the interests of the Florentine State during its conflicts with Milan at the end of the fourteenth century as well as during the War of the Eight Saints (even though Florence lost, in the end). Not only an effective statesman, he was also crucial in promoting humanism and ensuring that the next generation of humanists (i.e., Poggio Bracciolini and Leonardo Bruni) was educated by his findings and exposed to a passion for classical literature. He contributed to the development of philology and textual criticism with his relentless pursuit of manuscripts and sources in order to find answers to some of the most seemingly minute questions. While many recent scholars have been baffled by the stark contrasts within the canon of texts written by Salutati, others find logic behind the chaos of references and disconnected thought. Unafraid of tackling immensely abstract concepts, in the midst of his politically empirical role as chancellor, Salutati dove into such subject matters as "fortune" and "fate" as defined by Christian restraints (in *De fato et fortuna*) as well as the value of the *vita attiva* in comparison to the *vita contemplativa* (in *De seculo et religione*). As Witt mentions, he promoted the comprehension of historical context with his letters by including historical references and fostering propaganda for the state of Florence. As Ullman observes, Salutati is a man ahead of his time, reflecting the future of Humanism and the Renaissance, while maintaining medieval interests with his pious

references not only in his letters, but in his work *De seculo et religione*. In other words, he represents an interesting point on the barometer between these very distinct intellectual movements – not necessarily one or the other, he embodies characteristics of both. Perhaps instead of discounting the work of this highly appointed scholar, we should note the bravery entailed by the intellectual pursuits of such a pious man – willing to take on such daunting subjects as those mentioned above while maintaining ties to an often restrictive faith.

Abstract

Giorgio Benigno Salviati (Juraj Dragišić) was a Franciscan philosopher and theologian who lived between the fifteenth century and the sixteenth century. Despite being a little-known figure among the Renaissance humanists, he got in touch with some of the most important intellectuals and politicians of his time (Cardinal Bessarion, Federico da Montefeltro, Lorenzo de' Medici, Girolamo Savonarola, Johannes Reuchlin) and took part in important philosophical debates, such as the Plato-Aristotle controversy, the disputes concerning the *futura contingencia* and the nature of the angels, the quarrel about Savonarola's prophecies, and the controversy on the destruction of the Jewish books.

Alternate Names

Dragišić, Juraj; Benignus, Georgius; Benignus de Salviatis, Georgius; de Argentina, Georgius; Benignus de Feliciis, Georgius; Georgius Graecus de Bosnia

Biography

Giorgio Benigno Salviati, born Juraj Dragišić, was a Franciscan philosopher and theologian who was born in Srebrenica (lat. *Argentina*) between 1444 and 1446. In 1463, the Ottoman

invasion forced him to flee to Dubrovnik and then to Ferrara, where he entered the monastery of the Holy Spirit as deacon; he studied in Ferrara, Padua, Pavia, and later in the universities of Paris and Oxford, and, among his teachers, there was also the famous English Scotist John Foxal (Etzkorn 1989). On 18 March 1469, he was ordained, and, in the fall, he moved to Rome, where he got in touch with Cardinal Bessarion and became part of his cultural circle.

In 1469–1470 he wrote the so-called *Defensorium Bessarionis*, a treatise, now lost, composed in defense of Bessarion against George of Trebizond; because of his contribution, the Cardinal named him *Benignus* (Monfasani 1981). Bessarion is also one of the characters in his dialogue concerning the *futura contingencia*, *De libertate et immutabilitate Dei*, written in 1471 (Etzkorn 1997). When Bessarion passed away, in 1472, S. moved to Urbino as rector of the local *Studium generale*; there, he became the official tutor of Guidobaldo, Federico da Montefeltro's son. During his stay in Federico's court, he composed two dialogues, the *De communicatione divinae naturae*, about the mystery of the Trinity, and the *Fridericus, sive de animae regni principe*. In the latter, S. explains the relationship between soul, reason, and will, arguing that will is superior to reason and controls the soul (Sojat 1972).

In 1485, 3 years after Federico's death, S. left Urbino and moved to Florence, where he was adopted by the Salviati family and was appointed professor of theology at the *Studium*. While in Florence, he wrote several books, the *Dialectica nova* (a handbook of logic), the *Septem et septuaginta in opuscolo Magistri Nicolai de Mirabilibus reperta mirabilia* (a treatise about the cause of evil written against the Dominican Nicholas de Mirabilibus), and the *Opus septem illustrium quaestionum* (a theological commentary on Lorenzo de' Medici's sonnet *Lo spirito talora a sè ridotto*; Vasoli 1985), and a dialogue on the nature of the angels (*De natura angelica*) dedicated to Lorenzo de' Medici, which is still unpublished.

In 1494, after Lorenzo's death and the fall of his son Piero, S. was involved in the repression of the supporters of the Medici family, was forced to leave Florence, and repaired to Dubrovnik; one of his most famous works, the *Propheticae solutiones*, dates to the period of his exile. It deals with the question of the authenticity of Savonarola's prophecies: S. claims that, although the only authentic prophecies are those of the Old Testament regarding Jesus Christ, new prophecies are still possible after Christ's death and resurrection and that Savonarola's prophecies are reliable and trustworthy (Garfagnini 1989; Vasoli 1989). At the same time, he also wrote another dialogue called *De natura angelica*, which was printed in Florence in 1499. Here the debate focuses on the characteristics of the angels and their actions and hierarchy and on the relationships between humans and angels.

In 1500 S. returned to Italy, where he was granted important scientific and ecclesiastic positions. In 1505 he was designated rector of the Franciscan Order in Austria, in 1506 he became professor of theology in the *Studium Urbis*, and between 1507 and 1509 he was a member of a delegation to the court of Emperor Maximilian I, to whom he dedicated his *Vexillum christianae victoriae*. In 1507 S. was nominated bishop of Cagli and in 1512 he became archbishop of Nazareth, whose see was then located in the Apulian town Barletta. At the beginning of the sixteenth century, it is also probable that S. revised and divulged Blessed Amadeus' prophetic treatise *Apocalypsis nova* (Vasoli 1969, 1970; Morisi 1970).

In the 1510s, S. was involved in the quarrel about the destruction of Jewish books, especially the *Talmud*. In 1509 Emperor Maximilian I proclaimed that all Jewish books had to be confiscated and suppressed, but the German humanist Johannes Reuchlin opposed his decision; in 1517 S. published a dialogue called *Defensio Johannis Reuchlin*, in which Reuchlin argues that the *Talmud* cannot be destroyed and could even be useful for Christians wishing to acquire a deeper knowledge of the Holy Scripture.

He passed away in 1520, probably in his episcopal see at Barletta.

Sánchez, Francisco

Born: 1551 Tuy

Died: 1623 Toulouse

Manuel Bermúdez Vázquez

Department of Social Sciences and Humanities,
Facultad de Ciencias de la Educación, University
of Cordoba, Cordoba, Spain

Abstract

Francisco Sánchez (1551–1623) was a physician, philosopher, and author of *Quod nihil scitur* (*That Nothing Is Known* in its most accepted translation). He was an original thinker and also a predecessor of Descartes. The use of the methodical doubt by the French comes directly from Sánchez. He also coined the term *methodus sciendi* (scientific method), a half-century before it was popularized by Francis Bacon. It is a term that will largely determine the philosophical paths of the history of thought from the seventeenth century onwards. Francisco Sánchez and his

philosophical writings are much more important and original than previously acknowledged. Despite his writings and his work as a doctor or as a singular philosopher and interpreter of skepticism, the question of his biographical analysis distracted the attention of most scholars. Sanchez's biography, although important, is not essential in the analysis of the intellectual or philosophical composition of his books. More important to our understanding of Sánchez as a philosopher are the aspects of his scientific or epistemological critiques as well as his use of skepticism that made him an evolutionary step in the development of skepticism in the Renaissance and in the history of philosophy.

Biography

Francisco Sánchez was born in Tuy, in the region of Galicia (Spain), in 1551, to a family of converted Jews. Although originally given as 1550, baptism records indicate that Sánchez was baptized on June 25 1551, in San Juan Church in Braga. It is therefore thought that Sánchez was born in 1551 rather than 1550 since many scholars consider unlikely such a lengthy delay between his birth and baptism.

The original homeland of Sánchez is also unclear. Many Lusitanian intellectuals and researchers have argued that Sánchez was actually Portuguese or, at least, should be considered Portuguese based on some data and documents about his birth. Raimundo Delassus, Sánchez's disciple, thought that his master was Portuguese because he was baptized in the diocese of Braga. Nevertheless, documentary evidence clearly indicates that Sánchez was born in Tuy, which, despite being under the ecclesiastical jurisdiction of the diocese of Braga at that time, is in Galicia. Sánchez himself declared his Spanish origin by signing with his own hand in the enrollment document of entry to the Faculty of Medicine of the University of Montpellier: "*Ego, Franciscus Sanctius, hispanus, natus in civitate Tudensi.*"

The conclusion to which we inevitably arrive is that Francisco Sánchez was born in Tuy, Spain,

and was baptized in the diocese of Braga, Portugal. He received the sacrament of baptism in Valença do Minho, a town across the Minho River (and the modern border between Spain and Portugal) from Tuy where Sánchez's family used to have friends and relatives.

Aside from the author's place of birth, for most of his life, Sánchez lived in France and, to a lesser extent, Italy. On the other hand, it is necessary to point out that Sánchez was conscious of his Hispanic origin, which is not an impediment to playing down the relevance that in an author such as Sanchez his origin may have.

Around 1562, Sánchez emigrated to Bordeaux with his family, where he attended the renowned college of Guyenne. Before this date and his departure to France, his life and academic preparation are obscure. Bordeaux was, in those years, a city that hosted a wide range of Jewish people and was a city known for its tolerance as well as being full of open-minded, liberal people. The college of Guyenne was an organization sponsored by people from the Jewish community and newly converted Christians; we cannot suppose that they kept any sort of activity related to the so-called Judaic Spirit (among the features that define the "Jewish spirit" in the sixteenth century, there would be a tendency to be reserved, a somewhat suspicious attitude, absent of patriotism, and a detachment from Christian customs). It seems that Francisco Sánchez's father, Antonio Sánchez, either converted to Christianity or was descended from Jewish converts. Curiously, Antonio Sánchez's brother-in-law, Antonio López, was the brother-in-law of Montaigne's father; thus, Sánchez and Montaigne, two of the biggest exponents of the skepticism in the Renaissance, were related.

Sánchez's journey to Bordeaux was probably motivated by anti-Jewish persecution in Spain and Portugal. The Sánchez family was no longer Jewish, but in this period, many converted Jews were considered "false Christians," and the society's pressure could become stifling. It is unclear how much Francisco Sánchez was influenced by Judaism, if at all, and this question seems very difficult to establish.

Religious beliefs cannot be perceived easily; they belong to the deepest intimacy and the character of every person. In a period like this, marked by intolerance, people hid their rites as a necessity imposed by law. This was especially true for people like Sánchez, whose ancestors linked him directly with the Jewish people. On the one hand, we have a number of details that connected Sánchez with Judaism or Crypto-Judaism, which was extensive in scale around the whole of Europe in the sixteenth century. On the other hand, in his public life, Sánchez never showed any sign that could cast doubt on the sincerity of his Catholic faith. Nothing in his works could make us doubt his adherence to Catholicism. In addition, it is significant to point out that two of his sons dedicated their lives to the priesthood.

The atmosphere of the college of Guyenne where Sánchez had studied during his stay in Bordeaux was quite peculiar. His professors were likely demanding and possibly even quite intransigent in the application of the most rigorous methods of philological humanism. This first training was of paramount importance to Sánchez's intellectual maturation. The college of Guyenne worshipped both classical antiquity and an approximation to investigation free of prejudices, attempting to distance Sánchez and his classmates to any kind of scientific dogmatism. It was in this early period of the author's formation when an emergent interest in the study of nature was planted in his mind.

After his father's and uncle's death in Bordeaux in 1570, Sánchez went to Rome in 1571, where he had some relatives and where he remained until 1573. It was in Rome, at Università di "La Sapienza," where he obtained his doctorate degree in philosophy. His training as a doctor and philosopher had here a deciding momentum. The studies of medicine were being completely renewed in Italy thanks to the great progress in anatomy and physiology. Galenic medicine, which had been reinforced with Arabic advances in medicine, was, up to the Renaissance, a practically sacred school and covered much more than medical issues; it was also a real conception of the

world, nature, and the human being. However, when Galenism went into crisis in that period, Sánchez showed one of the strongest characteristics of his character: the opposition to any sort of authority and tradition that moved away from empiricism in natural issues including medical ones. The only effective authority which Sánchez recognized was the one of nature, against the authority of the masters of the past.

In Rome, Sánchez initiated contact with the most important intellectual circles from the period and met Cristóbal Clavio, who was a celebrated mathematician; they became very close friends. Sánchez, probably, alternated between studies of philosophy and medicine. While in Rome, he also met his old childhood friend from Tuy, Diego de Castro, who took part in the Battle of Lepanto. Sánchez's works, *Carmen de cometa* and *Quod nihil scitur*, were dedicated to him.

Sánchez returned to France in 1573 and he registered at the Université de Montpellier, whose fame as a school of medicine was recognized throughout Europe. The atmosphere in this city was not as tolerant as in Bordeaux. Huguenots controlled the city and were hostile to the Catholic minority. Nevertheless, Sánchez managed to become a doctor in medicine on June 4, 1574. Sánchez was forced to leave Montpellier following the rejection by the university hierarchy of Sánchez's application to one of the chairs of the Medicine faculty. Part of the critics considered that the decision to reject Sánchez's application was enormously influenced by the fact that he was not only Catholic but also suspicious of having Hebrew ancestries. Moreover, the atmosphere of intransigence in Montpellier was not suited to Sánchez's antiauthoritarian temperament.

It was after his failure at Montpellier that Sánchez went to Toulouse, where he spent the rest of his life working as a professor at the Université de Toulouse. It was in Toulouse where he obtained fame, fortune, and admiration.

During the first years of his stay in Toulouse, Sánchez wrote part of his philosophical work. At the same time, his thought was beginning to take shape and develop in the sense that marked his

entire life. It was in January of 1581, the same year *Quod nihil scitur* appeared, that he started to work in the hospital of Santiago, in Toulouse. In 1585, thanks to his work and his personal value, he was designated Professor of Philosophy in the Arts Faculty at the Université de Toulouse. In 1610, after a brilliant examination, Sánchez finally achieved the position of Professor of Medicine. He maintained the position until his death, on November 15, 1623.

Heritage and Rupture with the Tradition

A feature that should be discussed regarding Sánchez's philosophical stance is the influence of Jewish culture in his work. In order to analyze this hypothetical Jewish legacy, one of the elements that stand out is that the *Laus deo virginique Mariae* which appeared at the end of most of his works and writings is not included in two of the most important ones: *Quod nihil scitur* and *Carmen de cometa*.

The praise to Virgin Mary had his importance and it was included in a great part of the works of his time. *Quod nihil scitur* appeared in Lyon in 1581 but, according to the author himself, was written 7 years before. *Carmen de cometa* was written in 1578. Both books were early works from a period in which Sánchez might have kept the influence of his father, Antonio Sánchez, and his uncle, Adán Francisco. The absence of the praise to the Virgin could be due to close proximity to the beliefs that were abandoned by his family not many generations before. Nevertheless, Sánchez's real religious beliefs, in those early years of his philosophical maturation, cannot be known with total certainty. Furthermore, the personal development of the author once he was accepted in the Toulouse community, having gained prestige among the citizens, led him to a stronger assimilation with Catholicism, a belief by which he was forced to leave Montpellier.

It seems that the philosophical Jewish tradition left its mark in some elements of Sánchez's thought, especially in his first works. There are

some questions, for example, the critic of the analysis of names as the base of the philosophical investigation. One of Sánchez's accusations was that the whole history of philosophy could be summarized in vacuous crossroads of words. Instead of occupying their time in the direct investigation of nature, most philosophers had decided to waste their time being worried only about words, erecting a huge building of concepts that constituted the fabric of a fictitious unreal world external to nature. Sánchez accused Aristotle of being the first one who confused nature with words because he based all his philosophical theories on the definitions of words. Here appeared another coincidence with the Jewish world: the philosophical Sephardic tradition did not recognize the link between nature and language. Language was based on convention, not on nature; it is because of that that the meaning of the words did not reflect the real nature of things. In the same way, Francisco Sánchez denied the ability of words to reflect the real nature of things, due to the fact that the different languages are arbitrary and the fruit of convention. Words that formed the language cannot constitute a reliable source of information about the true and last essence of the object that they mention.

The influence of Judaism is more than probable. Almost certainly, Sánchez drank from the source of Jewish philosophy in which he was born and developed himself as a thinker. Jewish thought had a place in Sánchez's work in the sense that its ideas were used in the negation of the possibility of knowledge, which was Sánchez's goal. On the other hand, it is necessary to avoid exaggerations or dogmatic assertions. Jewish thought, however it was present in his work, was not a crucial element in his philosophy because of the innovative and radically new character of his books and because of Sánchez's philosophical orientation, which was, on the one hand, markedly scientific and, on the other hand, a different study of nature.

Philosophical Works

Francisco Sánchez wrote two philosophical books: *Carmen de cometa* in 1578 and *Quod*

nihil scitur in 1581 (written 7 years before according to Sánchez's testimony), both edited in Lyon. The importance of the latter is greater than any of Sánchez's other works. *Quod nihil scitur* was a preface, a statement of intent to introduce his philosophy. In this book, there were several promises of other books that would complete his philosophical vision.

The importance of this book increases when we acknowledge that it offers a new way of understanding science and knowledge. Sánchez was the first philosopher who proposed and spoke about a *methodus sciendi* (method of science) years before Francis Bacon wrote his *Novum Organum* (a work that was in the same direction and had an equal pursuit to that of *Quod nihil scitur*, but enjoyed much more success). This fact itself should have placed Sánchez in a more prominent position in the history of philosophy.

After Sánchez's death, his sons and his disciple, Delassus, published his other works of philosophical themes: *De longitudine et brevitate vitae liber*, *In librum Aristotelis Physiognomicon commentarius*, and *De divinatione per somnum, ad Aristotelem*, all published in Toulouse in 1636 under the title *Opera medica*, – a great work that included Sánchez's medical and philosophical treatises. All philosophical books written by Sánchez, excluding the medical treatises, appeared in 1649 in Rotterdam in an edition entitled *Quod nihil scitur*. In order to have a complete panorama of Sánchez's philosophical works, a letter found in 1940 entitled *Epistula ad C. Clavium*, addressed to his friend Cristóbal Clavio and signed with the false name of Carnéades, must be included. Other philosophical books which were promised but were never produced include: *Examen rerum*, *De anima*, *Libri Naturae*, and *De modo sciendi* or *Methodus sciendi*, the last of which was destined to be the most important of all had it been written. Sánchez promised to include his theory about science and knowledge in this book, but he never wrote it.

Thus, we can say that Sánchez's most important book was *Quod nihil scitur*. It showed the philosophical stance of the author and it deserves an important position in the history of thought.

Innovative and Original Aspects

A book such as *Quod nihil scitur* has countless problems and references, which are challenges not only for readers but even, it seems, for Sánchez. There is a wide range of philosophical questioning. Thus, there are intrinsic limitations in the analysis of Sánchez's work.

Before starting to enquire whether it is possible for a human being to achieve any sort of knowledge, Sánchez claimed that it was necessary to create a *tabula rasa* ridding the concepts learned during the futile and tedious scholastic *iter*. This critical "cleaning process" of the spirit, which consisted of "questioning everything as if no one had ever said anything" (as Sánchez wrote in *Quod nihil scitur*), presented some analogies with the methodical doubt which was later the basis of Descartes' speculation in *Discourse on the Method*. For Sánchez, however, doubt, even having a radical scope, is considered and analyzed exclusively in relation to science and wisdom.

In his battle in favor of doubt and against the unconditional acceptance of the authority's opinion, Sánchez chose the question as to the prime ally. Questions are shown as the best weapon to fight against the language of his contemporary peripatetic philosophers. Questions are absolutely superior to whatever kind of articulation of thesis and synthesis, due to their natural ability to instill doubt in the listener. The fact is that asking ourselves "who can say something is true of all that was, is, or will be?" presents a superior range when compared to the simple negation of whatever certain fact related to the past, the present, or the future. And this is so because it places the individual in the face of *variae hominum opiniones* and involves at the same time the scientific nature (or according to Sánchez, no scientific nature), and it goes further, leading to a critical reflection about itself.

Sánchez turned back at his own past and confirmed that what he thought was "science" proved nothing else but simple ignorance. He had no more choices, but claiming that "I don't even know this: I know nothing. I suspect, however, that neither I nor the others." In spite of the patent self-contradiction, of which Sánchez is

completely aware, this formula is the fundamental idea in the *Quod Nihil Scitur*. This formula already announces the abandonment of Pyrrhonism and the approximation to the negative dogmatism of Plato's Academy under the stewardship of Arcesilas and Carneades (which is, probably, what is best suited to Sánchez's philosophical stance). Nevertheless, Sánchez did not hesitate to use arguments taken from Pyrrho. The fact that there are Pyrrhonian and academic elements intertwined may lead some to think of some sort of Sanchezian eclecticism, but the truth is Sánchez's lack of clarity and his overall strategy to destroy the wisdom of his time made him to turn to any theory or concept which could help him in his purpose.

Among the several doctrines that Sánchez used, the one which had more scope in *Quod Nihil Scitur* was the negative dogmatism that opened and closed the work and was even present in the title itself. Sánchez claimed that we cannot know anything with certainty, although it is possible to continue with the tireless search for the truth in spite of the difficulty of achieving any goal. That is not an obstacle for Sánchez to say that he is confident to establish a certain and easy science. This stance is far from Pyrrhonism, and closer to the academic skepticism, that showed the impossibility of the perfect knowledge and admitted a plausible knowledge that approaches to certainty.

On the aim of the book which constituted the *pars construens* of Sánchez's thought, that is, to find what was the "*methodus sciendi*," there is no more than the promise. It is clear what it is that Sánchez understood by method of knowledge by taking what he claimed several times in his book: if a human being wants to know something, compatible with his abilities, it is necessary to carry out a conversion. This conversion required the thinker to abandon the previous conception of knowledge where truth was in the words of the great philosophers of the past and replace it with a personal and free inquiry of reality. On the one hand, the examination of reality is likely Sánchez's main goal. On the other hand, however, it is absolutely impossible to reconstruct, except in broad terms, what Sánchez understood as his

method. The method he proposed was based on experimentation and judgment and was barely developed. In fact, how can we even try to study the reality after the radical demolition of any possibility of knowledge? For Sánchez, the only thing that can be claimed is that this demolition should be made in the mind of the scientists, the professors, and the teachers.

Impact and Legacy

Being very interested in science, Sánchez started to use the concept of scientific method long before this idea was taken into account in the intellectual circles. His work was partially silenced by the vicissitudes of history that any text has to suffer; furthermore, it was not as successful as it could have been due to the fact that it was written in Latin. Menéndez Pelayo said that Sánchez was more quoted than read, which is a sad assessment for an author as original and provoking as him.

Skepticism marks the evolution of the scientific model. Modern science is the heir to the recovery of skepticism in the Renaissance due to its necessity of providing acceptable reasons to the critiques that were made to reason, understanding, and perception through skepticism. After all, doubt and the ability to question, typical features of human beings, are inserted in the deepest part of the personality of each individual. We cannot allow this ability to rule over us due to the high risk of being mentally inactive, as we can see in the Buridan's donkey example – a donkey being tied at the same distance from a container full of water and another one full of food; as it didn't feel much starving than thirsty, it did not eat or drink anything and, finally, it died.

It is not an insignificant fact that Sánchez published in 1581 a book with a remarkable skeptical tendency. It is not that Sánchez, out of the blue, wanted to use skeptical tropes and arguments of the academic skepticism. It needed a long process of assimilation, as well as the appearance of a new generation of thinkers willing to use these techniques in their critiques. Other thinkers who were in touch with the skepticism in the sixteenth century, such as Gianfrancesco Pico or Cornelius Agrippa, adopted a fideistic attitude by

placing faith and revelation before any other possibility of knowledge. This critique was integrated within the religious framework; Sánchez's critique was more focused in the aim of obtaining a general vision of the reality of the epistemic possibilities and its reflection was guided towards the investigation of a *methodus sciendi*.

Sanctorius

Born: 29 March 1561, Capodistria, Venetian Republic (now Koper)

Died: 22 February 1636, Venice

Jan Purnis

Department of English, Campion College at the University of Regina, Regina, SK, Canada

Abstract

Sanctorius was an important Renaissance physician and physiologist. He is best known for his role in developing experimental medicine and incorporating instruments of quantification

like the thermometer into clinical medicine, and he is considered the founder of metabolic studies. Engaging in an extended period of self-experimentation, Sanctorius employed a specifically designed weighing device to measure his ingestion, excretion, and body weight under different conditions over the course of 30 years, using this data to quantify insensible perspiration, the perspiration occurring through respiration and the pores.

Synonyms

Sanctorius Sanctorius; Santorio Sanctorius; Santorio Santorio

Biography

Santorio Santorio (Sanctorius) was born on March 29, 1561 in Capodistria, the capital of Istria (also known by its Roman name of Justinopolis), which was under Venetian rule at the time. His father was a Friulian nobleman who was a high-ranking official in the Venetian Republic, and his mother was from a wealthy and noble Istrian family. Sanctorius was educated in Capodistria and Venice before enrolling in 1575 at the University of Padua, where he studied philosophy, mathematics, and medicine. Between obtaining his medical degree in 1582 and establishing a medical practice in Venice in 1599, he seems to have spent time in Croatia as a personal physician to a local nobleman. From 1611 to 1624, he was professor of theoretical medicine at the University of Padua. Sanctorius was part of a circle that included Galileo. Upon retirement, he was honored with the permanent title of professor and an annual pension. He moved to Venice, where, in 1630, he became president of the Venetian College of Physicians and Chief Health Officer. Sanctorius died in 1636 (Eknayan 1999; Grmek 2008).

Heritage and Rupture

Sanctorius was trained in the ancient humoral medical theory inherited by the Renaissance, and

he gave lectures on Hippocrates, Galen, and Ibn Sīnā (Avicenna), publishing commentaries on their works (Sanctorius 1629, 1612, 1626). The four humors were black bile (melancholy), yellow bile (choler), blood, and phlegm. The proportion of humors within an individual affected temperament and health. Illness was linked to humoral imbalance, and medical therapy concentrated on achieving balance through diet and purgation. Heat and moisture were central to this medical theory: the humors, which corresponded to the four elements, were categorized as hot or cold and moist or dry, as were foods; digestion was believed to occur through the action of heat; and attention was paid to the innate or radical heat and moisture of the body. Although Sanctorius worked within the humoral tradition, he stressed sensory observation and reason over the authority of Galen, Hippocrates, Aristotle, and others (Grmek 2008). Sanctorius diverged significantly from Aristotelian natural philosophy and Galenic medicine in comparing the body to a clock, using a mechanical – rather than organic – metaphor, and in stressing the importance of mathematical properties (number, position, form), traditionally considered accidental, over qualities and essences (Van Helden 1995; Grmek 2008).

Innovative and Original Aspects

Sanctorius made original contributions to medicine through his experimentation and use of quantitative instruments (Eknoyan 1999; Lemmer 2015; Bigotti 2016). He invented devices to measure more precisely the pulse (with the pulsilogium), humidity (with the hygrometer), and temperature that were so important in humoral medicine. He is a key figure in the history of the development of the thermometer (Wright 2016). While Galileo seems to have designed an earlier air thermometer, Sanctorius appears to have been the first to add a numerical scale and to use it in clinical medicine (Grmek 2008) (see Fig. 1). In addition to his role in instrument invention, refinement, and application, Sanctorius is most famous for his study of *perspiratio insensibilis* (insensible perspiration) –

Sanctorius, Fig. 1 Sanctorius's pulsilogium (left) and thermometer (right) from his *Commentaria in primam Fen primi libri Canonis Avicennae*, 1626 (Courtesy of the Wellcome Library, London)

excretion through the pores and respiration – for which he is considered the founder of the study of metabolism (Eknoyan 1999). Although insensible perspiration was an ancient concept, Sanctorius undertook to measure it through an extended period of self-experimentation, claiming in an address to the reader that this had not yet been attempted by any philosopher or physician

Sanctorius,

Fig. 2 Sanctorius's weighing chair. From the frontispiece to John Quincy's 1718 translation of *Medicina Statica* (Courtesy of the Wellcome Library, London)

(Sanctorius 1676; Renbourn 1960). Over the course of 30 years he weighed himself, what he ingested, and his feces and urine, employing a specially designed weighing chair, thereby putting the balance to a new use (Dacome 2001) (see Fig. 2). In an early example of the application of mathematics to medicine associated with the iatromathematical school, Sanctorius determined the ratio of insensible perspiration to sensible evacuation under various conditions, observing that the amount of the former exceeded that of the latter, thus foregrounding its importance to health

(Eknoyan 1999; Bigotti 2016). He considered the effect of air and water, meat and drink, sleep and vigilance, exercise and rest, sexual activity, and the emotions – the nonnaturals of humoral medicine – on perspiration and body weight.

Sanctorius presented his findings as a collection of aphorisms in *Ars de statica medicina*, first published in 1614. In 1615, Ippolito Obizzi (Hippolytus Obicius) challenged Sanctorius in his *Staticomastix*, prompting a response in Sanctorius' second edition of his book (Grmek 2008), which was reprinted about 40 times into the eighteenth

century, and translated into English in 1676, Italian in 1704, French in 1722, and German in 1736 (Kuriyama 2008). Martin Lister, Giorgio Baglivi, and John Quincy, among others, provided commentaries on Sanctorius's highly influential book; references to Sanctorian perspiration appeared in a wide range of eighteenth-century discussions – about the resurrection of the body (Dacome 2006) and vegetarianism (Albala 2002), for example – and efforts were made by a new generation of weight watchers to improve his weighing device and repeat his experiments in different climates (Dacome 2012). Of Sanctorius, Kuriyama (2008) suggests that he was the first “to urge some vital connection between the numbers read off a scale and a person's state of being” (416), and Wear (1981) writes that in his “reduction of occult forces and properties to three-dimensionality” he “pre-figured, unconsciously, the mood of the new science of the seventeenth century” (256). He also influenced the later iatrophysical school and has been described as an important precursor of modern medical physics (Duck 2014).

CRAL, CNRS-EHESS, Paris, France

INSHS, CNRS, Paris, France

Abstract

In 1615, Robert Sanderson, then an Oxford college tutor of logic, was the author of a very popular textbook representative of the contemporary university teaching in this instrumental art of philosophy. However, he was not a philosopher by career, but an influential cleric in the Church of England. Sanderson spent much of his life as the rector of Boothby Pagnell, Lincolnshire, and received the bishopric of Lincoln in his later years. He was a convinced anti-Puritan, but also a convinced anti-Arminian. A famous preacher, his sermons, though influenced by the Calvinist doctrine of predestination, gained him nonetheless William Laud's favor and Charles I's protection. In the second half of the 1640s, as the Regius Professor of Divinity at Oxford, he proposed original argumentation on the topics of natural law, obligation, and conscience. His correspondence in the 1650s on problems of decision-making in cases of conscience, published posthumously, also constitutes a crucial milestone in the history of Anglican moral theology and casuistry.

Biography

The descendant of an old family of Yorkshire, Robert Sanderson, born in Sheffield on 19 September 1587, was educated at Rotherham Grammar School. At 13, having made great advances in the Greek and Latin languages, he was admitted to Lincoln College, Oxford, by Richard Kilby, one of the translators of KJB. Given his young age, he did not matriculate until

1 July 1603. He graduated B.A. on 23 January 1605 and was elected a Lincoln Fellow in May 1606. He usually studied philosophers and classic authors 11 hours a day. Walton's *Life of Dr. Sanderson* reports that in his old age he was still able to recite all of Cicero's *De Officiis*, his main reading with Aristotle's *Rhetorics* and Aquinas's *Secunda secundae*. Having proceeded M.A. on 20 October 1607, he was elected Logic Reader on 7 November 1608. A few years later, he was admitted to holy orders (2 September 1611, deacon; 8 March 1612, priest) by John King, Bishop of London. He prepared for a B.D. degree, studying John Calvin's *Institutio Christianae Religionis* with much care and applauding its conformity with Augustine. Sub-Rector of his college in 1613–1614 and 1616, he was chosen Senior Proctor of the University on 10 April 1616. All that time he had continued to teach philosophy at Lincoln. His lectures on logic, *Artis Logicae Compendium*, the most popular and influential textbook in seventeenth-century British universities, particularly at Oxford where it was on the colleges' reading lists for decades, was published in 1615. The manuscript of his *Physicae Scientiae Compendium*, presumably methodized in the same period, remained unpublished. With these two manuals, he intended to represent the division between the instrumental disciplines of philosophy and the sciences which are its theoretical parts. He was one of the first in England to organize a logic textbook according to the three acts of the mind. The function of logic was for him to direct these acts, simple concept, composition/division, and discourse (the most perfect, split into argumentation, and method or order). Although his doctrine of proposition summarized the medieval supposition theory, the brief history of logic exposed in appendix did not insist on fourteenth-century terminism. The key assertion was the preeminence of Peripatetic logic over Ramist and Lullist logics. His abridgment of the science of physics was Aristotelian too, ending with a doctrine of the soul and its faculties.

He gained his B.D. degree on 19 May 1617 and was licensed to preach. His clerical career began in May 1618, when his relative Sir Nicholas Sanderson presented him to the rectory of

Wyberton. He was also granted by dispensation the vicarage of Heckington. The place proving unhealthy to him, he soon surrendered his Wyberton office. On 6 May 1619, he resigned his Fellowship. On 8 July 1619, with the patronage of Thomas Harrington, esquire, he became rector of Boothby Pagnell, a living which he would conserve for over 40 years. Tobias Matthew, Archbishop of York, allotted him a prebend of Southwell Collegiate Church. He was also made chaplain to George Montaigne, Bishop of Lincoln. From then, he was regularly elected as a clerk on all the Church of England Convocations. In 1619 or 1620, he married Ann, daughter of Henry Nelson, rector of Haugham, with whom he would have three sons and two daughters. He soon became a prominent preacher with a variety of audiences: members of clergy on bishop's visitations; judges at the Assizes; crowds of faithful. Published in scattered order from 1622 to 1635, four sermons *Ad Clerum* from 17 April 1619 at St Botolph's, Boston, the parish of the Puritan John Cotton, to 22 August 1634, on William Laud's metropolitanical visitation at Grantham, three *Ad Magistratum* from 11 June 1623 at Grantham to 4 August 1625 at Lincoln, and seven *Ad Populum* from 27 February 1620 at Grantham to 6 May 1632 at St Paul's Cross were collected in 1637 and reissued in 1657. In his visitation sermons, Arminianism was portrayed in 1619 as semi-Pelagianism; in 1621, Calvinist predestination was claimed to be the "true" and "necessary" doctrine. In 1625, the year of Charles I's succession to James I, he seized the opportunity of the Convocation on which he was a clerk to state his position with regard to the Arminian controversy caused by Richard Montague's *A New Gagg for an Old Goose* and his *Appello Caesarem* in reply to John Heigham's Catholic pamphlet against the Anglican Church, *The Gagge of the Reformed Gospel*. The "peace of the Church" was his essential concern. His manuscript *Pax Ecclesiae* (published in 1678) insisted that the public controversy generated the risk of a "dangerous schism" within the Anglican Church. In this controversy over the Anglican Church's adhesion to Calvinist predestination, he rejected the identification of Calvinism with Puritanism and of

Arminianism with Catholicism, and pleaded for a middle way between two extremes, "rigid" Calvinism and "quarter-Pelagian" Arminianism. In defense of Calvinism against the accusation of Puritanism, he advocated the tutelary figures of the anti-Presbyterian John Whitgift and Richard Hooker (the Preface to the 1657 edition of his *Sermons* would advocate them again). Hooker's *Of the Laws of Ecclesiastical Polity* had a significant influence on his position.

On 3 September 1629, he was installed into the prebendship of Farrendon-cum-Balderton in Lincoln Cathedral by John Williams, Bishop of Lincoln. Laud, Bishop of London and Chancellor of the University of Oxford, although he advantaged the altar's sacraments over the preacher's pulpit, praised the casuistical expertise of his sermons. On his recommendation, he was given a royal chaplaincy in ordinary in November 1631. From then, he preached many Court sermons. Sixteen sermons *Ad Aulam*, from November 1631 at Whitehall to Charles I's detainment in 1647–1648 at Newport, Isle of Wight, were published for the first time in 1656 together with three new sermons *Ad Magistratum* and one *Ad Populum*. He became the favorite preacher of Charles I, who declared that he carried his conscience, not his ears as for ordinary preachers, to his sermons. In 1633, he was recommended to the rectory of Muston, Leicestershire, by the MP George Manners, seventh Earl of Rutland, and instituted with the King's patronage. He attended the royal visits at Belvoir Castle, a near place, in 1634 and 1636. He was those years a member of the Great Tew Circle, a group of Anglicans concerned with the lack of unity of their Church, who had meetings at Lucius Cary's house. During a royal visit to the University of Oxford in August 1636, he graduated D.D. The same year, he took part in the Sabbath observance debates roused by Charles I's decision in 1633 to impose James I's *Book of Sports*. He sided with the King's party, claiming that Sunday was not a divine institution, and lawful recreation could be used. He supported the "Etcetera Oath" introduced by the 1640 Convocation, but disapproved of its compulsory imposition. Although he had dedicated to Laud his 1635 edition of *Two Sermons*, he did not

conform to Laud's outlawing of predestinarian preaching, nor did he concur with his "beauty of holiness" program of ceremonial innovations for reforming the Church worship. Laud, however, charged him in 1641 to revise the Book of Common Prayer (BCP). From March to mid-May 1641, he also was among the members of the sub-committee nominated by the Committee of Religion installed by the Parliament about doctrinal and liturgical matters. From 1642, he held the Beekingham prebend of Southwell. In July 1642, he was appointed Regius Professor of Divinity at Oxford University in succession to John Prideaux, who was made Bishop of Worcester. The canonry of Christ Church was appended to his Divinity Professorship. Yet the civil war outbreking in August prevented him to take up his chair at that moment. In June 1643, he was among the nine Episcopalians nominated by the Long Parliament, together with Presbyterians, Independents, and Erastians, to reform the Church of England. Out of loyalty to Charles I, he sat not in this Westminster Assembly and rejected the Solemn League and Covenant adopted on 25 September 1643. His benefice at Boothby Pagnell was sequestered in 1644. He was for a time imprisoned at Lincoln, to be exchanged with the rector of Allington, the Puritan Robert Clark, prisoner of the King's garrison at Newark. In 1646, after Charles I left Oxford, his headquarters since 1642, he took up his chair of Regius Professor of Divinity. He delivered his Inaugural Lecture on 26 October 1646 and read at the Divinity School during Michaelmas Term seven Latin lectures on the obligation of oaths, published the following year. In 1647, he read ten Latin lectures on conscience and the obligation of human laws as grounded in the primary and absolute obligation of the law of God. The two sets of these lectures on oaths and on conscience constituted in the early 1660s an essential source for Locke's *Essays on the Law of Nature*. Conscience was not defined in the ordinary Thomistic sense of a mental act, but as a natural or innate habit enabling the human mind to apply by reasoning to particular actions self-evident practical principles or common notions. A good intention, good examples, or the authority of experienced men cannot

constitute "the adequate rule of conscience." Only the *voluntas signi* of God, which the "law of nature" makes manifest, shows what is man's moral duty. He opposed the Puritan scripturalist view that the written Word of God was the absolute rule of all actions whatsoever. His tenth lecture on conscience examined the aphorism "*The safety of the people is the supreme Law.*" It denounced the pernicious interpretation of the *salus populi* maxim as a liberty ("the right of the subjects") to be preferred to the prerogative of sovereignty, whereas its right meaning is that the sovereign has authority over the laws themselves and can "by his plenitude of power" suspend for a time their observance, in case of necessity. With Richard Zouch, the Regius Professor of Civil Law, author of the *Elementa Jurisprudentiae* used as an important legal reference in his lectures, he published in 1647 the pamphlet *Reasons of the present Judgement of the University of Oxford*, against submission to a series of Parliament ordinances on Presbyterian principles – the 1643 Covenant, the 1645 Negative Oath, and the Directory of Public Worship supplanting the BCP. His reasons of conscience and Zouch's legal arguments in defense of monarchy and episcopacy, approved by a full convocation on 1 June 1647, were immediately translated into Latin by Gerard Langbaine, the University archivist. On 14 June 1648, he was ejected by the Parliamentary visitors from his professorship and canonry at Oxford.

After Charles I's confinement to Hampton Court in August 1647, he and other chaplains, Henry Hammond, Gilbert Sheldon, and George Morley, were permitted to attend the King in his detainment. At Charles I's request, he composed an answer to the Puritan objections against Church government by bishops, which was published after the Restoration in 1661 with a dedication to Charles II. Afterward, he attended the King in his captivity on the Isle of Wight. During the negotiations with Parliamentarians for the Treaty of Newport in September–November 1648, he was one of the main ecclesiastical advisers to Charles I on matters of conscience, the religious reforms demanded by Parliament constituting for the King a perjury to his Coronation Oath. He preached before the King

in October 1648 a sermon on *Galatians* 5.22–23 which would be separately published in 1653, while his other sermons *Ad Aulam* in this period would be included in the 1656 edition of *Twenty Sermons*. Charles I's English translation of his 1646 lectures on promissory oaths, revised at Newport by James Harrington and Thomas Herbert, was subsequently approved by Hammond, Sheldon, and William Juxon, and published in 1655 as *De Juramento*. It was considered a model of casuistical argumentation in rupture with Jesuit "sophistries." During the Interregnum, he published in 1649 a *Resolution of Conscience* criticizing the justification for safety's sake of the allegiance to *de facto* power by Anthony Ascham in his *Discourse of the Confusions and Revolutions of Government* and his *The Bounds & Bonds of Publique Obedience*. He rejected Ascham's thesis of reciprocity between protection and obedience and denounced the self-preservation principle as dangerous, leading to attempt "continual innovations," and resulting in atheism. In the early 1650s, he carried on an active correspondence on cases of conscience, which constitutes a major contribution to the tradition of English Protestant casuistry begun with William Perkins. In the Oath of Engagement controversy, his position, expressed in a letter to Thomas Washbourne dated 20 December 1650, was that since in its literal meaning the Engagement did not oblige to approve the abolition of monarchy and to acknowledge the power of the present Commonwealth as a power possessed of *de jure*, to subscribe it in a "low" sense rather than suffer extreme prejudice could not be condemned. Influenced by the Aristotelian-Thomistic moral tradition, he argued that the rule of prudence does not violate the law of conscience. His answer on 12 November 1652 to another case of conscience concerning the use or abandonment of the old liturgy reveals that he had adopted after the 1645 banishment of BCP by Parliament an attitude of compromise, waiving at first its use in all services, and then modifying its wording by way of addition, transposition, or omission, so that the service might appear both other and "the same." This, he said, was not merely to avoid penalties, but ultimately to prevent the attribution

of his ministerial charge to Puritans exercising a "Presbyterian tyranny." Hammond, an uncompromising "Cavalier" whose thesis "*Our Saviour died for the sins of all mankind*" in his 1645 *Practical Catechism* had been attacked by the Presbyterians of Sion College in London, visited him around the beginning of 1651 to discuss Arminian points in the Quinquarticular Controversy between Remonstrants and Anti-Remonstrants. A correspondence on the topic of universal redemption and salvation followed with Hammond and Thomas Pierce – the two rejoiced in November 1653 when he abandoned the idea of attending the Puritan Tuesday-Lectures at Grantham. The 1657 republication of the 1637 collection of his *Sermons*, however, made only slight alterations to his initial affirmation of the similarity of Arminianism to Pelagianism. His predestinarian thesis on divine grace remained unchanged. In the Preface dated 13 July 1657, furthermore, he positioned himself between Puritans or "Anti-Ceremonians" and Arminians: ceremonies are in themselves indifferent things, but once they are constituted, the necessity to obey them arises from God's command that men obey their superiors. Condemning as erroneous the Puritan principle that nothing may be done which is not warranted from some command or example in the Scripture, he argued that the liturgy of the Anglican Church did not constitute a denial of the Protestant rule of faith, the sufficiency of the Scripture. Hammond, in his *Charis kai eirènè, or, A Pacifick Discourse of Gods Grace and Decrees: In a Letter, of full Accordance written to the Reverend, and most learned, Dr. Robert Sanderson*, attempted nonetheless to prove that Sanderson since 1625 had abandoned the "Sublapsarian way" and no longer owned his former Calvinist soteriology. Hammond's unreliability was denounced much later by John Edwards, in the Appendix to his book *The Arminian Doctrines Condemn'd by the Holy Scriptures, by Many of the Ancient Fathers, by the Church of England, and even by the Suffrage of Right Reason* in 1711: for Edwards, Sanderson "retain'd his Calvinistical Sentiments to the Day of his Death."

In the late years of the 1650s, he was reduced to severe poverty. Through Thomas Barlow, keeper of the Bodleian Library, Robert Boyle afforded

him financial support, awarding him from 1658 a special pension for reviewing and publishing his 1647 lectures on the obligation of conscience, which were circulating in manuscript copies (from which seemingly Jeremy Taylor borrowed a number of quotations for his *Ductor Dubitantium, or The Rule of Conscience in all her generall measures*, published in 1660). The publication was done in 1660, with a dedication to Boyle. An English translation by Robert Codrington was published in the same year. At the Restoration of monarchy, he was reinstalled in his professorship and canonry at Oxford in August 1660. Soon after, he was promoted to bishopric and received an episcopal see. He resigned his sundry prebends and was consecrated Bishop of Lincoln at Westminster on 28 October 1660. On the same day, there were 67 applicants to get their ordination from him. He managed then to repair (at his own expense) war damages to his episcopal palace at Buckden, Huntingdonshire. In a long Preface, dated 31 December 1660, to his edition of a manuscript treatise composed by James Ussher, the late archbishop of Armagh and primate of all Ireland, he firmly denounced the contractualist doctrine deriving the royal power from the people. In his view, this doctrine made the sovereign power precarious, while sovereignty must be absolute and unlimited. He attacked as a contradiction *in adjecto* the notion of mixed monarchy, which had become popular in the last years of the civil war. He also wrote the Preface to the *Clavi Trabales* published by Nicholas Bernard in 1661, which contained two speeches by Ussher, the one about the king's supremacy, the other about the duty of subjects to supply the king's necessities. In April–July 1661, he was the moderator in the Savoy Conference convened to consider the Presbyterian Exceptions to doctrinal points and ceremonial directions in the existing BCP of 1604. Most of the Exceptions were disallowed; he agreed only minor concessions to the Puritan leader Richard Baxter. He contributed to the new version of the Prayer Book, based on John Cosin's MS annotations to a copy of the 1619 printed BCP, the so-called Durham Book. His Preface to the new BCP emphasized the choice of a medium position

concerning traditional Anglican liturgy: "It hath been the wisdom of the Church of England. . .to keep the mean between the two Extremes, of too much stiffness in refusing, and of too much easiness in admitting, any variation from it." The new BCP was annexed to the 1662 Act of Uniformity enjoining all clerics to declare their "unfeigned assent and consent" to all its prescriptions.

Weakened by a chronic disease, he made his last will in early January 1663. In his account of his religious conviction, he insisted that his fight against Roman Catholicism and Puritanism had been on a rational basis, "after a serious and impartial examination of the grounds." He also asked for a modest funeral. He died on 29 January, survived by his wife and their three sons. He left a great number of manuscript volumes on the history of England (particularly of Lincolnshire), heraldry and genealogy. Although his last will stipulated that he disowned any writings published under his name after his death, posthumous editions publishing his letters on cases of conscience were made from the mid-1660s. Almost two centuries later, the publication of his six-volume *Works* in 1854 by William Jakobson, Regius Professor of Divinity at Oxford, confirmed the lasting importance of his moral theology and casuistry.

Abstract

A prolific writer and publisher active in sixteenth century Venice, Francesco Sansovino was able to combine his humanistic education with a strong commitment to publishing and dispersing new information and a keen eye for the book market. Despite possessing a degree in civil law, which would have granted him steady employment, he chose the uncertain path of publishing and devoted most of his energies to spreading knowledge in the vernacular. He translated classical and modern authors, wrote manuals and treatises, compiled epitomes and collections of works on several subjects, sometimes copying unscrupulously from his sources, but often displayed creativity in his approach to such materials. His understanding of the contemporary book market guaranteed him enough success to open a printing press and to stay in business for over 20 years; he also contributed to the dissemination of culture, starting or boosting literary genres that became very popular in the succeeding years. His prolific and varied

production has been studied from several perspectives in the last decades (for a selected bibliography, see Davis, FONTES 43:12–14, 2009), but a specific feature has been observed by multiple scholars: with every subject, Sansovino consistently focused on its practical implications. This concrete, didactic dimension is probably his most distinctive trait and becomes particularly interesting when applied to politics.

Alternate Names

Guisconi, Anselmo; Tatti da Sansovino, Francesco; Sansovinus, Franciscus; Sansouino; Sansovini; Tatti, Giovanni

Biography

Francesco Sansovino was son of the sculptor and architect Jacopo Sansovino (born Jacopo Tatti). He spent his childhood in Rome, but in 1527 – after the city was ransacked – he moved to Florence and finally to Venice, where his father had been granted a prestigious job by the Republic. Jacopo's position gave Francesco the chance to receive a fine humanistic education, under the mentorship of Stefano Piazzone da Asola and Giovita Rapicio; at the same time, his father's friendship with Pietro Aretino helped Francesco come into contact with the Venetian cultural circle orbiting around the famous writer.

At the behest of his father, Sansovino studied law in Padua and Bologna between 1536 and 1543, with a short stay in Florence between 1540 and 1541. However, during those years, he showed greater interest in literary subjects than jurisprudence; in Padua, he joined the *Accademia degli Infiammati* (1540); later he became a member of the Florentine *Accademia degli Umidi* (1542). After graduating, he returned to Venice and began closely collaborating with several publishers as an editor, translator, compiler, and author of texts (among others, he worked for Gabriel Giolito de' Ferrari alongside another famous polygraph, Ludovico Dolce). However,

this choice not only caused several arguments with his father but also guaranteed him no stability. Hence (upon Jacopo's suggestion) in 1550, he went to Rome in the service of Pope Julius III, but his experience as a courtier was a failure, and in 1552, he was back in Venice, where he married (1554) and settled, deciding to fully dedicate himself to literary activity (with the exception of a short experience as secretary of duke Paolo Giordano Orsini, between 1564 and 1565).

In 1558, he joined the *Accademia Veneziana* (or *Accademia della Fama*). Two years later, he opened his own printing press, which issued more than 40 publications before his death in 1583. At first, he shared the business with partners (seven titles published between 1560 and 1561 are signed by *Francesco Sansovino et compagni*), but soon enough he was running the press on his own. From 1569 on, all of his publications feature his son Giacomo on their imprints (Ascarelli and Menato 1989, 406–407).

A prolific and versatile writer, Sansovino dealt with almost every subject (a survey of his production is provided by Cicogna 1834, 31–91; and Mula 2010; but check also the database EDIT16 for a list of his publications). His main focuses were history and literature, but he also wrote about rhetoric, politics, law, medicine, agriculture, art, religion, and love. Most of his works appeared under his own name, though he sometimes also used pseudonyms (mainly “Giovanni Tatti”). With about a hundred publications to his name, Sansovino participated significantly in the dissemination of culture in many fields, fully matching the profile of a polygraph.

Writings and Thought

His humanistic studies, the Venetian cultural environment and his early experiences at the Paduan and Florentine academies all played important roles in shaping young Sansovino's mind. In fact, they put him in contact with a wide network of humanists, academics, artists, and noblemen, a feat quite impressive for a student still barely 20 years old. These connections are vividly outlined in the *Lettere sopra*

le dieci giornate del Decamerone (1542), a collection of epistles – one for each novel of the *Decameron* – addressed by Sansovino to an almost equal number of his acquaintances. Here the author approaches Boccaccio's text in an original manner, not only conversing about love but also often using the novels as sparks for religious, moral, and erudite reflections with his correspondents. The letters also sketch the moral picture of a young man highly contemptuous of the corruption within princely courts, critical of the hypocrisy of the clergy, scholastic thought and the cult of the saints, and eager for a simpler and more personal spiritual experience (Roaf 1985, 1993; Bonora 1994; Favaro 2014).

The *Lettere*, however, represent an exception to Sansovino's activities, in which he chose for himself the role of popularizer. As such, his first aim was a practical utility for a large public, and history – broadly speaking – was to be his subject of choice. In his works, he conveyed useful information about his own times, including descriptions of cities, chronologies, family histories, epitomes (Sforza 1897; Grendler 1969). He also aimed at offering a political interpretation of history, in the belief that this might provide lessons for the improvement of current administrations. Another interesting feature of his methodology is his modern approach to documentary sources. He in fact showed a remarkable appreciation for them, following in this the example set by such major historians as Francesco Guicciardini and Paolo Giovio (Grendler 1969).

In disseminating such ideas, Sansovino naturally chose Italian over Latin, sharing the commitment of the academies to spreading culture through the vernacular. This stands out especially in his early reflections about public speaking in Italian (*La rhetorica* 1543; *L'arte oratoria* 1546), which later took on a more didactic form in his collections of models for both speeches and letters (*Diverse orationi volgarmente scritte* 1561a; *Il segretario* 1564), in a collection of grammars (*Osservationi della lingua volgare* 1562; see Peirone 1971), and in the dictionary published by his own printing house (*Ortografia delle voci della lingua nostra* 1568), which also shows certain attention to spoken language and dialects

(Marazzini 1983). All of his activities as a translator and disseminator confirm his commitment, but his choice is particularly relevant when applied to disciplines, such as law, in which Latin remained the preferred language of communication (in 1552, he translated Justinian's *Institutiones*).

Both as a writer and a publisher, Sansovino understood his public. His many works about Turks and their history, for example, answered the growing desire to know about a foreign population, which undoubtedly felt very close at hand in those days. His *Historia universale dell'origine et imperio de' Turchi* (1560), in particular, became the main source in Italian about Turks until the end of the century (Bonora 1994; see also Zilli 2001). A few years later, in his *Del segretario* (a practical manual for the formation of chancery functionaries), he took an already existing genre and refashioned it to meet the needs of his contemporaries. This manual became very popular, was reprinted numerous times, and was taken as a model by several writers (for a recent and detailed study on the topic, see Panzera 2018).

Overall, Sansovino facilitated the rise of numerous popular genres, such as epistolary collections, speeches, novels, books of secrets, manuals, and compendia. He was also, however, very cautious about religious themes, especially after the Council of Trent. The juvenile and unorthodox feelings expressed in the *Lettere* faded from his mature production, while the few religious titles edited and published by him aligned closely with the positions of the reformed Church (Bonora 1994).

His most famous work, however, was *Venetia città nobilissima et singolare* (1581). This encyclopedic description of Venice was preceded by other city guides, such as *Tutte le cose notabili e belle che sono in Venetia* (1556), a short dialogue published under the pseudonym Anselmo Guisconi, which saw nearly 20 editions and several additions before 1600; and the *Ritratto delle più nobili et famose città d'Italia* (1575), in which many important Italian cities are described. Yet Sansovino owes a large part of his posthumous fame to his *Venetia*, which teems with

information and curiosities that are still of interest to today's researchers, guiding the reader through the city while celebrating the Republic with a description (from a rather antiquarian perspective) of its glories, monuments, and heroes (Bonora 1994, 2000).

Sansovino's Works on Politics

Most of Sansovino's books were republished several times in the succeeding decades, confirming that his strategies were highly successful. However, as a popularizer, only a minimal part of what he wrote can be considered truly original. He often extrapolated (when he did not copy entirely) his works from many different sources. Nevertheless, he showed some creativity in this process, at least in organizing the information conveyed in such publications. His method as a compiler can be understood by looking at his political works, the *Concetti Politici* (1578) and *Del governo dei regni et delle repubbliche* (1561b), which also provide a good example of the role played by Sansovino in the dissemination of culture.

The *Concetti* is a collection of 803 aphorisms on political subjects, derived from several authors. The first edition was translated into English by Robert Hitchcock, under the title of *The quintessence of wit* (1590). The work was then revised by Sansovino before his death and published in 1583 together with Guicciardini's *Avvertimenti* and Lottini's *Avvertimenti civili*. This second edition was reprinted in 1588, 1598, and 1608.

In the preface to the 1578 edition, Sansovino states that he drew the aphorisms from 36 authorities (a statement that was omitted from succeeding editions). These were both classical and contemporary sources (e.g., Aristotle, Plato, Cicero, Cassius Dio, and Thucydides; Francesco Guicciardini, Giovan Battista Pigna, Marc'Antonio Sabellico, and Paolo Giovio), whose maxims Sansovino reported sometimes *verbatim*, though often he adjusted and integrated them with personal reflections. Grendler states that the *Concetti* provides a distillation of some

of the best political wisdom of the century (Grendler 1969, 163).
